In the hands of the hybridist over one hundred direct crosses between it and other species and hybrids have been made, and further crossing of the progeny has resulted in O. crispum being the beautifying factor, in some degree, in the greater part of the wonderful collection of Odontoglossums and Odontiodas in our gardens to-day.

But the puzzle has always been why Odontoglossum crispum should vary in beauty and colour more than any other Odontoglossum.

In *The Gardeners' Chronicle* of June 27, 1903, p. 410, the late Mr. Norman C. Cookson asked, "When is a crispum not a crispum?" and stated a case, the discussion of which was continued occasionally under various headings, but no definite solution was arrived at. The theory generally accepted is that the white form is the type species, while the blotched forms—which seem too pronounced to be due to polymorphism—have resulted from a crossing with some other species in the remote past, but which cannot be reconciled with any of the species or numerous hybrids now growing naturally with O. crispum, and which may have passed away in the great process of evolution and elimination which is always going on in nature.

An interesting point is that in the different localities in which O. crispum is found, the quality of all the plants varies, those found in the Pacho district (alt. 7,500-8,000 feet) being the best, the typical white form from that region being still the first favourite. The Velez and Fusagasugá types differ sufficiently to be recognisable by expert collectors, but the greatest departure from the recognised type is seen in O. crispum Lehmannii (see Fig. 114), discovered by the late F. C. Lehmann near Santiago and Putamayo, in dense woods in the Pasta district, on the Eastern Andes, at 5,800 to 7,400 feet. This is the smallest form, and varies probably more than any other. As with the other sections, the white forms, often on branched spikes, are the commonest, spotted forms less frequent, and heavily blotched varieties occasional. The lip, which is the most reliable botanical feature, is markedly different from that of the other types; so much so that were it not for the connecting white forms and the fact that it was named by its discoverer (one of the most competent authorities), its standing

FIG. 114.—ODONTOGLOSSUM CRISPUM LEHMANNII.

as a distinct species would be open to consideration. It is noteworthy that in all the rather widely separated localities in which O. crispum is found the same remarkable variation occurs, and must either have originated in the same disturbing agency in each locality or spread from a common centre.

A glance at the illustrations now given, selected from a large number, shows that speculation as to the specific standing of O. crispum is to be easily accounted for, but not so readily solved. Seedlings raised at home prove the stability of the white type, which has been raised true and thus produced in finer form than imported varieties. The spotted forms, crossed, also give blotched forms, with an occasional white one; a reversion which occasionally occurs in batches of crosses of Odontoglossum and Odontioda having O. crispum in their ancestry, and which strengthens the suggestion that the white form is a true species.

Some plants raised between two blotched O. crispums have produced varieties scarcely distinguishable from O. eximium (crispum × ardentissimum), and among O. eximium itself forms appear which would pass for O. crispum. But these and similar experiences bring us little nearer to the solution of the difficulty.

Nevertheless, taking it for what it is, we must be thankful for this grand Odontoglossum, which is as much a favourite to-day as it was when it first displayed its beauties in gardens fifty years ago.

A reasonable suggestion as to the production of coloured varieties among plants of the original white O. crispum, without crossing with another species, is that they originated in peloric forms in which the petals and sometimes the sepals have the blotching which is generally more or less highly developed on the lip, many instances of which have been recorded from imported plants. Once the colour was transferred from the lip to the other segments its development among the innumerable seedlings would naturally tend to produce such coloured forms as we now see. Transference of colour from the lip to the outer segments, without peloric change, in garden hybrids also has often been more than suspected in the case of productions with darker sepals and petals than either of the parents, the colour resembling, however, the labellum of one or both. *J. O'Brien.*

(*To be concluded.*)

NOTICES OF BOOKS.

THE AMERICAN ROSE ANNUAL.

The fourth volume of *The American Rose Annual** opens with a pleasantly written article by Mrs. Wright, already known to the public as the "Commuter's Wife," followed by Dr Van Fleet, who considers "Fragrant Roses" and their several perfumes. It is interesting to note that he thinks the name Rosa cinnamomea derived rather from the colour of the twigs than from the perfume of the flower, and it is certainly true that the flowers of the species met with in this country have no Cinnamon perfume; the Musk Rose also he seems to regard as misnamed. His general conclusions as to perfume correspond fairly well with those of M. Jules Gravereaux, who gave much study to the subject, but many will be surprised to read that he found the flowers of the Rosa gallica hybrid Mrs Curzon (presumably that known in this country as Lady

Fig. 115.—Odontoglossum crispum Rosemary : a fine white variety in Sir George Holford's collection.
(See page 236).

Curzon, introduced by Turner in 1902) to give "almost double the relative yield" of attar of Rose perfume, the average yield being 1 lb. to 3,000 lb. of fresh petals.

Crown canker is rapidly becoming a serious trouble to the Rose grower, and Prof. L. M. Massey pursues his investigation in this disease, dealing, in his article in the present volume, with its attack on greenhouse Roses.

An attempt to estimate the comparative value of different varieties of Roses by recording the number of flowers produced in the course of the season occupies the attention of several contributors. This method was suggested by Capt. G. C. Thomas in *Practical Book of Outdoor Rose Growing,* who himself gives tables recording his own observations. Mr Mulford, Mr A P Greeley, of Washington, and Mr A W Greeley, of Wiscasset, give the results recorded by them respectively, and they are sufficiently striking, while the last named observer shows graphically the quantity of Roses cut alongside of a temperature curve, and in another set of curves a comparison of the production of the five best H.P.'s, H.T.'s and Tea Roses, affords very sound reasons for growing all three classes.

The difference between the 200 blooms recorded as produced by a Rose named Mme. Eugene Marlitt and the five given to Lieut. Chaure by Mr A. P. Greeley is certainly very great and we would like to know whether disbudding was practised, as without it many Roses are of small account.

The varieties found by the three observers to produce more than 70 flowers per plant in the course of the season are as follows:—

Mr A P Greeley: Mme Eugène Marlitt (?), 200; George Elgar (Poly. pom.), 185; G Nabonnand (T.), 144; Leonie Lamesch (C.), 131; Eugenie Lamesch (C.), 101; Lady Ursula (H.T.), 99; Ecarlate (H.T.), 87; Lucullus, 71.

Mr. A. W. Greeley: Mrs. A. R. Waddell (H.T.), 84; Mme. Jules Bouche (H.T.), 81; La Tosca (H.T.), 80; Gruss an Teplitz (H.T.), 79; Harry Kirk (T.), 76; Frau Karl Druschki (H.P.), 71; Betty (H.T.), 71.

Mr. Mulford: Gruss an Teplitz, 170; Reine Marguerite d'Italie, 143; Miss G. Clark, 128; Isabella Sprunt, 104; V. R Coxe, 83; Dr. Grill, 81; Irish Brightness, 80; Mary Countess of Ilchester, 77; Marie Lambert, 76; Gloire Lyonnaise, 71.

This method of comparison is interesting and capable of some development, but must clearly be limited by the method and purpose in and for which the Roses are grown. Thus, it would

* *The American Rose Annual*: Edited by J. Horace McFarland. Price (to non-members) $2. J. Horace McFarland Company, Mount Pleasant Press, Harrisburg, Pennsylvania.

obviously be unfair to compare by this standard a bush of Marie van Houtte or Comtesse du Cayla allowed to grow freely, and practically unpruned, with an exhibition H.T. such as Mrs. Theodore Roosevelt or Mrs. A. Coxhead, which is cut to the ground every season. Again, are all blooms to be counted, or only those that are sufficiently good to be typical of the variety when reasonably well grown? These are details, no doubt, but notwithstanding their importance the Editor of the *American Rose Annual* is to be congratulated on breaking new ground and doing good work.

The matters referred to above are far from exhausting the *Annual*, which contains many short articles not only from America, but from all parts of the world, and also a preliminary list of American raised Roses. *White Rose.*

JOTTINGS OF AN ALLOTMENT GARDENER

The author of this little book* has a style of his own, and has produced a chatty, readable work, yet one which is brimming over with practical information. We do not subscribe to all his views, e.g., the manurial value of sulphate of iron, or the advisability of allotment holders manufacturing their own chemical manures, even "when acids are cheap again." In the main, however, the advice is sound, and the book may be recommended to allotment holders as both interesting and instructive.

PLANT PRODUCTS AND CHEMICAL FERTILISERS.

THIS book † is one of the "Industrial Chemistry" series, and we cannot do better than use the author's own words in describing it: "No particular effort is made to give encyclopædic completeness of information, but the aim has been to give a fair conspectus of a large subject, with an appended bibliography for those who are able to pursue their studies further. . . . The volume covers the cycle from factory to fertiliser, from fertiliser to field, and from field to factory once more." In this work the author has supplied a much-felt want in providing agricultural and horticultural students with a text-book on the chemistry of plant products and fertilisers. The book is divided into four parts, which treat of fertilisers, soils, crops, and the production of meat. The parts are again subdivided into sections which deal with the separate branches of the subject in the manner of a special article or monograph. The book is rendered still more valuable by the references to important papers and standard works, and thereby acts as a guide to the standard literature on the subject.

The style of the book is very good and the type and paper excellent. The index is good—perhaps its greatest fault is that it is too complete, for turning up Bachelor of Science on page 220 we find that "One Bachelor of Science is farming on his own account, another is managing on behalf of a big company." Again, we look up the page referring to Spain and find that it is one of a number of countries where experiments have been made in the cultivation of the Soy Bean.

FIG. 116.—MAGNOLIA KOBUS FLOWERING ON WALL AT KEW.

MAGNOLIA KOBUS.

MAGNOLIA KOBUS, a Japanese species, is hardy in the South of England. Professor Sargent, who found it growing in the forests of Hokkaido, in Japan, describes it as a tree growing some 70 to 80 feet high. The flowers are creamy white in colour, slightly fragrant, and some four to five inches in diameter. When crushed, the young branches are also fragrant.

At Kew, M. Kobus usually produces its flowers from the beginning to the middle of April, but, as the flower buds open in succession, it is generally in flower for about a month. The subject of the illustration was planted many years ago against a wall, but failed to flower until recently. This failure was no doubt due to the fact that the tree was kept too closely pruned, as since it has been allowed more freedom it has flowered with increased profusion each year.

In common with all the early flowering Magnolias, the flowers of this species are apt to become damaged by inclement weather, therefore, although hardy in the open, it is well worth the shelter of a wall, especially a high one, where it may have room to develop into a good specimen. *J. C.*

The Week's Work.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Carnations.—Perpetual-flowering Carnations are most serviceable plants at this season for flowering under glass. They require careful attention just now, and if not shaded from bright sunshine the flowers do not develop their finest colours. Souvenir de la Malmaison varieties should be liberally supplied with water at the roots, and be fed frequently with a concentrated fertiliser. Fumigate the plants occasionally to prevent attacks of green fly. Damp the benches and floor of the house, afford plenty of air and attend to the tying of all young growths. Flowering plants of perpetual Carnations should frequently be supplied with a liquid fertiliser, and if any plants are required for another year's flowering, re-pot them about the beginning of June. Plants raised from cuttings inserted last autumn should now be shifted into their flowering pots in a compost of three parts best loam, one part rubble and wood ash and a 6-inch pot full of Carnation manure to each barrowful of these ingredients. Pot firmly, place the plants in a cool house on a foundation on ashes and spray them lightly on fine days, but water the roots carefully until the plants make new growth. Spring struck cuttings should now be ready for placing in 5-inch pots.

Specimen Flowering Plants.—For greenhouse and conservatory decoration Fuchsias may be potted into larger receptacles, the soil to consist of two parts loam and one part leaf-mould, with some dried cow manure and sand. Retain and regulate the side growths, pinch out the point of the shoots and train them as pyramidal specimens. Young plants raised from cuttings inserted last autumn may now be potted into 7-inch pots. Select straight-stemmed plants for standards, stake them and remove all side growths. Those chosen for pyramids should also be staked, but the side growths should remain. Ivy-leaved Pelargoniums may also be either trained as specimens, standards or pyramids, potted in good fibrous loam and a little bone meal and placed in a light airy house. When re-established allow an abundance of air and sunshine and pinch out the flowers and the points of the shoots until specimens of a desired shape and size are obtained.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Cattleya citrina.—This beautiful dwarf Cattleya, commonly known as the Mexican Tulip, should be flowering now, and the blooms last three or four weeks in perfection. This Orchid, in its natural habitat, is found growing at a high elevation, and consequently does not require much heat under cultivation. It must, however, have a large amount of light, with abundance of air. While it will succeed in the cool house during the warmer months of the year, a position in the cool-intermediate house is best for the plants. The peculiar habit of this species necessitates the plant being suspended head downwards, as in no other way can it be induced to grow. Plants should be securely and firmly fastened to a block of wood or a teak-wood raft, the latter being preferable, as a little rooting material can then be packed between the bars, which helps to conserve the moisture about the roots. During its inactive period this species bears drought with impunity, but when the flower buds show themselves, and during the season of active growth it should have a liberal yet not excessive supply of water.

Phalaenopsis.—After the long, cold and dull season experienced, it will be necessary to watch these plants rather closely now the weather is brighter, otherwise the foliage will suffer. I

am not sure that a little dull weather in spring is any disadvantage to these and many other Orchids, for the very bright weather sometimes prevalent in April is very trying after the winter and apt to occasion heavier shading than is desirable in the interest of the plants. In most instances Phalaenopsis plants will have commenced to make new roots, therefore fresh rooting material should be provided. It is essential that ample drainage be afforded, using clean crocks and lump charcoal for the purpose, and over this clean fresh Sphagnum-moss, with a little Osmunda, or A1 fibre, added for the stronger growing kinds. Until the plants are rooting freely in the new compost water must be applied sparingly, but when they are in full growth, during the summer months, more liberal waterings will be necessary. So long as the rooting material is allowed to dry before a fresh supply of water is given, little harm can come to them by watering in summer. It is when the material is soaked with moisture for several days in succession, and when the weather is dull, that harm accrues. I do not favour growing these Orchids under heavy shade and in a close, stuffy atmosphere, as much better results are obtained with more light and free ventilation on all suitable occasions. A position close to the roof glass, in the warmest house, should be chosen for Phalaenopsis, where a temperature of about 70° by day and about 60° by night may be afforded. Phalaenopsis delight in a high day temperature, from sunheat, if moisture and fresh air are afforded. In these conditions the growth will be active and free, and of a harder, more vigorous nature than that produced in stuffy and heavily shaded houses. Moreover, insects will not be so likely to attack the plants.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Early Vines.—Where the vines were started in December last, the fruits of sudh varieties as Black Hamburgh, Buckland Sweetwater and Foster's Seedling will be hastening to maturity. The house should be freely ventilated whenever the weather is suitable, and a dry, buoyant atmosphere maintained, this being one of the principal factors towards perfect colouring and flavour in Grapes, but unless there is healthy root action and good foliage perfect finish cannot be obtained. Vines which are free from red spider and thrip will probably remain so until the bunches are cut, when the vines may be thoroughly cleansed again.

Mid-Season Vines.—Vines started into growth early in the year are making rapid progress and should receive every encouragement possible to maintain healthy, clean growth. Having been thinned once, it is advisable to again examine the bunches of Grapes and remove an odd berry here and there where necessary. The varieties which most need attention are those whose berries are borne on short, stiff footstalks. Admitting air and regulating the amount of necessary fireheat require great care and watchfulness during this month in particular, as the temperature rises and falls quickly if there is a cold wind with occasional bursts of sunshine, and much mischief may result if the attendant is not on the alert to manage the ventilators accurately and promptly. During spells of dull, cold weather, atmospheric moisture should be considerably reduced and no more fireheat used than is absolutely necessary to keep up the minimum temperature required.

Late Vines.—When tying down the strong growths of Lady Hutt, Appley Towers, Black Alicante and other late Grapes a certain amount of patience must be exercised and the operation carried out by degrees, otherwise there is a danger of the growths breaking away from the spurs. Early stopping of the shoots at the desired length should be attended to daily. Keep a sharp look out for red spider, and if this pest is detected sponge the affected leaves after sunset. It is so much better for the vines and the crop to check the spread of this pest by this means than to have recourse to more stringent measures, such as sulphur vapourising, which is liable to cause further mischief if it not carefully carried out. Healthy vines and a good show of bunches are apt to lead the grower into the fatal mistake of overcropping. It is far better to undercrop than overcrop, as in the first case there will be every probability of securing a well-finished crop of fruit without endangering the future welfare of the vine. Overcropping, on the contrary, will result in badly finished bunches, and, with late Grapes, this error will be very pronounced. What constitutes a full crop is most difficult to define, and requires a personal and intimate knowledge of each and every vine.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

American Blight.—This troublesome pest is generally found where the bark of fruit trees is rough or has been damaged, and if it is not checked it causes a swollen growth and a knotted appearance of the stem. American Blight is very easily spread, and when it attacks the roots it is most difficult to eradicate. Old trees that are very badly infested should be cut out and burnt. On trees easy of access the colonies of the pest should be lightly touched with a little paint brush dipped in paraffin, care being taken to treat only the infested areas. Methylated spirits or boiled linseed oil are also effectual. Where the trees are large they should be syringed with a mixture of 1 lb. soft soap and half a pint of paraffin to 8 gallons of water. The water, or part of it, should be boiling, and the soap churned to a lather before adding the paraffin. The mixture should be used while warm, kept well stirred, and applied in the evening. Where the roots of trees are infested they should be bared as much as possible and washed with a soft-soap mixture, fresh soil being afterwards put on and the old soil burnt. Soap suds and liquid manure applied to the roots appear to be good preventives of American Blight on the roots

Mildew on Fruit Trees.—Mildew is often allowed to get too strong a hold on fruit trees before it is attacked, and often it is only when the mischief is severe that it is noticed. It shows in the form of a white powder on the young and tender leaves and shoots; it will sometimes attack the blossom and prevent the flowers expanding properly, thus injuring the crops. After the extreme weather we have experienced a mildew attack may be expected. It is advisable in bad cases to remove the badly infested shoots and leaves. Spraying with sulphide of potassium at the rate of one ounce of sulphide to two gallons of water will destroy mildew. Directly mildew is seen spraying should be done in the evening, three times a week, and when the infection is stopped the trees should be well syringed with clean water. Another good specific is made of soft soap, 4 oz.; flowers of sulphur, 3 oz.; and 3 gallons of water.

General Remarks.—We had 10° and 8° of frost respectively on April 27 and 28, with snow, rain and hail on the morning of April 28. Gooseberry and Currant trees were frozen. I had the bushes syringed with cold water before the sunshine reached them, and though many blooms were open little damage appears to have been done.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford. Wrotham Park, Barnet, Hertfordshire.

Calceolaria. — When planting out bedding Calceolarias, see that the roots are thoroughly soaked with water prior to lifting them. Plant very carefully and afford them a good mulching of leaf-mould or decayed manure in hot weather.

Wallflowers.—Sow seeds in drills on a well prepared border, and when large enough transplant the young seedlings, 9 inches apart, into an open spot, having previously deeply dug and manured the site. If given a good open position from the start, Wallflowers will develop sturdy plants. Cloth of Gold, Blood Red, Vulcan, Purple Queen, Faerie Queen, and Sutton's Darkest of All are good varieties.

Pentstemon.—Pentstemons should be planted out where they are to bloom. There are many useful varieties that will make a brilliant display if planted in good soil and watered freely in dry weather; Southgate Gem and Middleton Gem are especially useful and attractive varieties.

Window Boxes.—The filling of both window boxes and hanging baskets for summer display should now be taken in hand. See that all are scrupulously clean, well-drained, and filled with good soil pressed firm. Tastes differ as to the arrangements of plants. Small Fuchsias, Heliotropes, Pelargoniums, Marguerites, Ivy leaved Pelargoniums, Tropaeolums and Lobelias may be employed with good effect. Always plant the hardier kinds in boxes to be placed on the north side of the house, and in shaded positions. All may be forwarded in a little warmth till well established. Boxes that are filled with spring flowers may remain untouched for the time being, but suitable plants should be prepared and forwarded to be in readiness for them later on.

Roses.—The growth of Roses has been very slow, and therefore liable to insect attacks. Keep a careful look out for these pests, and use means for their destruction at the earliest possible moment. The larvae of the Rose sawfly are very troublesome and somewhat difficult to destroy. Hand-picking should be constantly practised, and repeated syringings given with nicotine wash or other effectual insecticides.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Thinning Seedling Vegetables.—Mistakes are frequently made through insufficient thinning of seedling vegetable crops, and the result is weak and poorly grown specimens. Parsnips should be left 9 inches apart at the final thinning. Thin Carrots to 3 inches apart at the first thinning, and delay the final thinning till all danger from fly or slugs is over. The later thinnings of Carrots will be appreciated for cooking. Onions need not be so severely thinned, and if left 2 inches apart in a zigzag line they will produce a heavy crop of fair-sized bulbs. Early Turnips of the Milan type need a final thinning to 4 inches apart, as they are pulled alternately when an inch and half in diameter. The later Turnips should be thinned to 6 inches apart, the alternate plants being used when just large enough. After thinning is completed give the crops a dusting of soot or burnt garden refuse and ply the Dutch hoe between the rows.

Frame Cucumbers.—As frames become empty they should be relined with fresh stable litter to maintain a steady bottom heat, and provided with suitable soil for Cucumbers. Place one plant in the centre of each light; stop the leading growth when 6 inches in length; syringe the foliage on sunny days, and maintain a warm atmosphere.

Lettuce.—Thin Lettuce plants as early as possible, and plant the thinnings for successional supplies. The space allowed should be governed by the variety, but from 6 to 12 inches apart is a good distance. After June arrives it is well to rely on sown Lettuce only, as transplanted seedlings are inclined to run to seed prematurely. During a hot, dry summer very little trouble is experienced in germinating small seeds if the drills are drawn rather deeper than usual and a dressing of old potting soil is given and the drills watered before sowing.

Planting.—Various vegetables that have been raised in boxes will need every care. Bring the soil into a fine tilth for their reception, plant firmly, and give them copious waterings. Should the weather be hot and dry after they are established in their permanent quarters rely on a frequent use of the hoe to promote growth and retain moisture.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, May 20.—
Royal Horticultural Society's Exhibition in the grounds of Chelsea Hospital (three days). Annual dinner of the Horticultural Club at Anderton's Hotel, Fleet Street, E.C., at 6.30 p.m.

WEDNESDAY, May 21.—
British Carnation Society's dinner at the Holborn Restaurant at 6.45 p.m. Annual meeting of the Kew Guild at 6.30 p.m., and annual dinner at 7.15 p.m., at the Dean Hotel, Oxford Street, W.C.

SALES FOR THE ENSUING WEEK.

WEDNESDAY.—
Orchids, by Protheroe & Morris, 67-68, Cheapside, at one p.m.

THURSDAY.—
Bay Trees, Palms, and Aspidistras, by Protheroe & Morris, at 3 p.m.
Clearance sale of Bedding Plants at the Nursery, Hampton Road, Teddington, at 12 o'clock, by Protheroe & Morris.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 54.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, May* 14, 10 a.m.: Bar., 29.9 temp., 69°. Weather—Bright sunshine.

The Chemistry of Succulence. The succulence of certain kinds of desert vegetation is among the most striking phenomena presented by plants. It occurs, of course, not only among the plants growing in hot dry deserts, but also among plants which exists in "physiologically" dry conditions, that is, conditions which though they may include a rich supply of water, offer it under such circumstances that the plant is unable to absorb it sufficiently to meet its normal wants. Thus succulents occur among seaside plants, and in their case the succulence is ascribed either to the necessity imposed on the plant to limit its water-absorption so as not to absorb an excess of saline material or to the difficulty of drawing in supplies of water only obtainable from the salt solution of sea-water. In any case, botanical science remained content for a long while in recognising in succulence a means or adaptation whereby the plant was able to survive and flourish in the abnormal circumstances of its environment. Evidently, however, this is but the beginning of wisdom, and there remain to answer the more interesting questions concerning the mode of origin of succulence.

That the succulent habit does reduce the water requirements of plants which possess it is, of course, easily proved, and it is a common experiment of the botanical laboratory to show that a fleshy stem or leaf of one of the succulent members of the Cactus family gives off water many dozens of times more slowly than does the leaf of an ordinary plant. It is also noteworthy and part of the "adaptation" that succulent plants are specially rich in mucilage. The presence of considerable quantities of gummy substances undoubtedly enables the cells to hold water very strongly, and hence the plant as a whole presents a great resistance to desiccation.

The most recent observations* appear to point in a very simple chemical explanation of the occurrence in the cells of certain desert plants of mucilaginous substances which confer in their turn high resistance to desiccation. According to these observations, when cells containing sugars (polysaccharides) undergo loss of water, the sugars are reduced to substances known as pentosans, of which substances plant mucilages are largely composed. Now it is well known sugars do not swell to any noteworthy extent when they take up water; pentosans, on the contrary, do swell in the presence of water, and hence as and when they are produced in plant cells under the influence of desiccation they are able to take up and hold fast the water supplied to them by the roots. The chemical origin of succulence would thus seem to be an automatic one: Desiccation—leading to the formation of pentosans with great power of imbibing water and hence of resistance to desiccation. A further suggestion is made by the authors based on the discovery of Professor Richards that Castilleja and Erigeron—both desert species, include in either case some individual plants with thin and some with thick leaves, and that the thickness or thinness is correlated with the water supply of the plants—a fact, indeed, that may be observed by anyone growing a succulent in a greenhouse. Prof. MacDougal and Mr. Spoer find that in the thin-leaved Castilleja plants the sap is about twice as acid as is that of the succulent-leaved plants, and hence advance the suggestion that it is among these orders of plants which are capable of producing sap with a high degree of acidity that succulence is possible.

Horticultural Club.—Lord Lambourne, C.V.O., has consented to accept the office of President of the Horticultural Club in succession to the late Sir Frank Crisp, Bart. He will preside at the annual dinner of the club, to be held on Tuesday next, the 20th inst., at Anderton's Hotel, Fleet Street, E.C., at 6.30 p.m. Those intending to be present are asked to notify the hon. secretary, Mr. G. F. Tinley, 41, Wellington Street, Strand, W.C.2.

The Gardeners' Royal Benevolent Institution.—The Prince of Wales has accepted the office of President of the Gardeners' Royal Benevolent Institution. King George, who is Patron of the Fund, formerly held the Presidential office, as also did the late King Edward.

* *The Origin and Physical Basis of Succulence in Plants*, by D. T. MacDougal and H. A. Spoer. Annual Report of Director of Department of Botanical Research, Carnegie Institution of Washington. Year Book No. 17.

The Chelsea Show.—Although the Royal Horticultural Society's great exhibition at Chelsea on Tuesday, Wednesday and Thursday next in the grounds of the Royal Hospital, Chelsea, will not be so large as those held in pre-war years, everything points to the show being a great success. All the usual features will be included, and rock gardens will be arranged, as in the past, in the open. The large tent used on former occasions will not be erected this year, but there will be ample tenting to accommodate such plants as need protection. It is expected that the displays of Orchids, Roses, Carnations and Tulips will be, if not so extensive as formerly, of high quality. The premier award, in addition to gold, silver and bronze medals and diplomas will be the Coronation Cup offered for the best exhibit from an amateur. The Society has determined to make the Show as educative as possible, and there will be exhibited fungous pests, models of garden operations, a unique collection of museum cases of actual specimens of insect pests; garden literature, diagrams of food values, the composition of various foods and the influence of stocks on the growth of trees, whilst lessons in spraying and an explanation of different sprayers and spray materials will be given. Lectures will be delivered by Dr. Frederick Keeble, F.R.S., on "Horticultural Education and Research," and by Dr. Rendle, F.R.S., on "The Educational Aspect of some of the Plants shown," while there will be a conference on "Increasing Home-grown Fruits," under the auspices of the R.H.S. and the Chamber of Horticulture. Many of the horticultural societies are taking advantage of the occasion, as will be seen from the list of appointments for the week, to hold their annual meetings and dinners on the first and second days of the exhibition.

Horticulture for Ex-Service Men.—A number of ex-service men have expressed a desire for instruction in fruit and vegetable growing. To meet the requirements of these men the Horticultural Division of the Board of Agriculture opened on Monday, the 12th inst., a training centre at Shippea Hill, near Lakenheath, Suffolk.

Cardiff Gardeners Unite.—The gardeners of Cardiff and district have formed a branch of the National Union of General Workers and drawn up a scale of working hours and wages. The branch has fixed the number of working hours per week as 48; wages vary from £3 10s. per week for a head gardener, where four or more are kept, and a foreman in a nursery or market gardens, to 16s. weekly for garden boys of fourteen years of age. Mr. John Julian, the chairman, informs us that the branch has more than 100 members, and embraces many of the qualified gardeners of the district. The secretary is Mr. C. Harris, 3, Voke's Row, Bridge Street, Llandaff.

From Horticultural Buildings to Aeroplanes.—Many of the larger horticultural sundries firms took up, during the war, the manufacture of munitions of one kind and another, and the well-known Norwich firm of horticultural builders, Messrs. Boulton and Paul, turned their attention to the making of aeroplanes, in which they have been eminently successful. Now that the war is over, although they have resumed their former business, the aircraft department is to be continued, and Messrs. Boulton and Paul have entered a twin-engined biplane for the Transatlantic flight. They consider that the aeroplane has a great future before it, even considered from the purely business point of view, and they have already commenced to use one of their own two-seater machines as a vehicle for the conveyance of one of their sales managers. Some of the largest importers of cut blooms from the Continent are already making inquiries as to the possibilities of aeroplane transport, and nurserymen who formerly purchased their greenhouses from the Norwich firm may continue their patronage in this new venture of the firm.

The Report of the National Fruit Growers' Federation.—The report for the period ending December 31, 1918, is prefaced by a message to fruit growers from Lord Ernle, President of the Board of Agriculture, in which testimony is given of the public-spirited manner in which

fruit growers accepted the irksome regulations which the war and the need for securing food supplies imposed upon them. A statement is also given of the assistance rendered by the Federation in the inquiries necessary before fruit prices could be fixed on anything like a reasonable basis. The difficulties, and in some cases hardships, attendant on any attempt to fix prices are now, however, nothing but a memory, and there is every reason for fruit growers to look forward to complete freedom of control so far as price fixing is concerned. The report concludes with a contribution from the Food Production Department of the Board of Agriculture, in which reasons are given for entertaining a hopeful view as to the prospects of fruit growers in the immediate future. The subject is one of such importance that the opinions expressed in this contribution are referred to below. The report concludes with a table showing the acreage of fruit in England and Wales in the years 1913 and 1918. From the latter it appears that whereas there has been an increase of 10,000 acres of Apples, the areas under other fruits have either remained fairly constant (Pears, Plums, and Cherries) or have undergone large reductions. Thus, Strawberries have been reduced owing to war conditions from 21,672 acres to 13,143, Raspberries from 7,043 to 6,537, and Currants and Gooseberries from 26,845 to 22,735 acres.

The Food Production Department on the Future of Fruit Growing.—Fruit growers established throughout the British Isles are displaying a general feeling of uneasiness as to their prospects in the future. There is a fear amongst them that the prices realised by home-grown produce will fall rapidly during the next few years until a point is reached when they are insufficient to cover the high cost of production and at the same time give a reasonable profit. They are afraid of over-production and gluts, partly as a result of the increase in fruit holdings by means of the various schemes of land settlement now before the country, but mainly owing to the resumption of unrestricted imports from abroad. This note is written in the hope that the arguments which it puts forward may allay these fears and may reassure all those connected with the home-grown fruit industry by indicating the directions in which the prospects for the future are promising. The fruit trade in the British Isles can be divided into two distinct parts, each of which requires separate consideration—viz.: (1) Apples and Pears, (2) Stone Fruits (Plums and Cherries) and Soft Fruits (Strawberries, Raspberries, Red and Black Currants and Gooseberries). *Apples and Pears:* Prior to the War vast quantities of these fruits were imported from abroad, with the result that during the war, when imports were restricted, the demand has been several times greater than the home-grown supply, even in years like 1917, when the crop was an excellent one. British growers do not always realise the fact that the demand for Apples and Pears in this country has been fostered and developed by the countries exporting to our markets. These countries have developed the markets for these fruits, first by attractive advertisements and then by maintaining a steady supply of fruit of standard quality, package and mark. In 1913, £2,230,370 worth of Apples were imported by the British Isles, the actual quantity was 3,257,419 cwts., giving an average value of about 13s. 4d. per cwt. or 4s. 9d. per bushel of 40 lbs. Unfortunately we are unable to compare production in this country with the imports from abroad, as the necessary statistics of home-production are not available. However, we know the following salient facts: That (1) the average quality of fruit grown in this country at the present time is not so good when it reaches the market as that of the fruit imported from abroad. (2) The varieties, quality, packages, and mark of home-grown produce are not standardised in the same way as the imported produce; with the result that British produce suffers. (3) The cost of production and marketing at home are in the main lower than in foreign countries, and hence the British grower is in a very favourable position in this respect. (4) The British grower of Apples and Pears has the finest market in the world at his own door if he will only adopt up-to-date methods and supply the markets with what they require. It will be patent to all that the present acreage devoted to Apples and Pears in this country is inadequate to supply the existing demand. Approximately 10,000 more acres are required to make this country self-supporting as regards these commodities alone. It is not suggested that it is possible for this country to become completely self-supporting in this respect, yet it is evident that the industry can increase very considerably before there is any chance of over-production, provided that quality is maintained. *Stone Fruits and Soft Fruits:* The situation as regards these fruits is somewhat as follows: Firstly, owing to their more perishable nature, they have a more restricted market than Apples and Pears. For this reason a risk of gluts must always exist, especially in seasons when the crop ripens rapidly and the marketing period is short. There seems, however, very little likelihood of a considerable fall in prices for several years to come. The poor prices made by stone fruits in the past have been very largely due to heavy foreign imports at low prices; on the other hand, low prices for soft fruits have been mainly due to over-production in this country, occasionally accentuated by heavy foreign imports. The present day position as regards these fruits is very reassuring, and there seems little likelihood of any gluts of soft fruits for the next five years at least. In fact, there seems little likelihood of present prices falling to any considerable extent. The 1918 acreage of soft fruits shows very considerable decreases on 1914. So much so that it must be several years before even the pre-war level of production is reached. Further, it is safe to assume that the consumption of fruit for direct domestic use—i.e., dessert, cooking and home preserving purposes—has increased during the war owing to the higher standard of living now found in many households. But the greatest insurance of all against possible gluts is the fact that the demand for jam in this country has increased in an amazing manner during the war. At the present time it is more than 150 per cent. greater than in pre-war days. Jam makers at the present time want to be in a position to

FIG. 117.—TWO PESTS OF THE ROSE.

Brown Rose Grub (Spilonota roborana).

(See page 242.)

The Common Tortrix Moth (Tortrix (Pandemis) ribeana).

resume their export trade, which in 1914 was valued at £387,892. They are, however, at a loss to know where the raw fruit is to come from to manufacture even our own requirements, still less to provide for export. There is, in fact, a world shortage of jam fruit. For this reason alone fruit growers should feel assured as to their prospects, at any rate for the period already mentioned. The British fruit grower has now a brilliant opportunity of placing his industry on the footing which it deserves. Enterprise in facing the present stiuation, together with organisation and combination amongst growers, are required to effect improvements which everybody admits are necessary and long overdue. The Horticultural Advisory Committee recently appointed by the President of the Board of Agriculture should prove a valuable aid to the growers in developing the fruit industry of this country.

ERYTHRONIUM.

This beautiful genus of bulbous plants consists of about fifteen species, the headquarters of which are in Western North America. Only one species in found in Europe, and one in Siberia. The species have nearly all been in cultivation at various times, but the number in gardens at the present time is probably less than a dozen. They are all delightful subjects for the woodland garden, and flower in the early spring. They may be planted in the lower and shadier parts of the rock garden, and enjoy a deep, light soil composed chiefly of leaf-mould, with plenty of moisture without stagnation. Offsets are produced freely by many species, and they are readily increased in this way. Another method of propagation is by means of seeds, but it takes some four years or more to raise flowering plants from seed. The best garden species are:—

Fig. 118.—Erythronium californicum: flowers cream coloured.

E. americanum (Yellow Adder's Tongue). A low growing species from Eastern North America, with beautifully marbled leaves and yellow flowers with recurved segments. In a moist, peaty bed amongst low growing plants the plant spreads freely.

E. californicum. This species (see Fig. 118) has been long known under the name of E. giganteum, which has also been applied to forms of E. revolutum. It is a handsome species from the dry slopes of Northern California, along the coast range. Strong plants will develop as many as five to eight flowers on each stem. The flowers are cream coloured, and the petals have an orange base, often with a maroon band. E. californicum, with its richly-mottled leaves, is very similar to E. citrinum, but differs in having a long, deeply-cleft style, the latter species having a short club-shaped one.

E. Dens canis (Common Dog's Tooth Violet). This European species is well known, and has beautifully marbled foliage and flowers varying in colour from rosy-purple to white. It is one of the best Erythroniums for naturalising in woodlands and shady places. E. sibiricum, which is sometimes accorded specific rank, is probably only a stronger and more handsome form with rich, purple-coloured flowers.

E. grandiflorum. Differing from most of the others by having green unmottled leaves, this species has bright yellow flowers. It is not so robust as some, and should be planted deeply in light, sandy loam amongst other low growing plants. The true E. giganteum is a robust form of this species.

E. Hartwegii. This plant has mottled leaves, and bears two or three flowers on each scape. The blossoms are pale yellow, and have an orange base. This species is a native of California.

E. Hendersonii. One of the most distinct species, with the handsome mottled leaves of E. californicum, and light purple flowers having a very dark purple centre, above which is a zone of yellow. It is a hardy and vigorous plant from Southern Oregon.

E. revolutum (see Fig. 119). The many forms of this species make up a handsome group, comprising some of the most beautiful members in the genus. As a rule the leaves are not so darkly mottled as in E. californicum, but they are broader and more robust. Generally the stems are one flowered but very sturdy, and often grow a foot tall. The members of this group are found wild on the borders of woods in heavy clay soils that are sometimes wet all the winter. But they will also thrive in lighter and drier soils. The type of the species has large, white or purple tinged flowers, which turn darker with age. The variety Johnsonii is a most exquisite rose-coloured form, whilst the variety Watsonii has cream-coloured flowers with a greenish shade, and often with a red band across the base.

All the above-named species are excellent plants for growing in pans for the alpine house. They come into flower early, and last for some time in perfection. In a north frame, potted in light rich soil and with plenty of moisture when in full growth they are easy to manage. *W. I.*

THE ROSARY.

TWO ROSE PESTS.

Two troublesome insect pests of the Rose are illustrated in Fig. 117 (see page 241).

Tortrix (Pandemis) ribeana, the Common Tortrix moth, is, as the English name implies, a common insect and attacks, besides Roses, Hazel, Cherry, Elm, Walnut, Apple, Plum and Currants. The front wings are yellowish brown with three well-defined markings of a darker shade outlined by dark brown. At the base of the wing near the attachment there is one patch with the edge roughly parallel to the wing margin, in the middle is an oblique stripe having a bulge in the middle, and on the costa of the wing towards the apex a roughly semi-circular spot. The hind wings are dark grey, and both wings are edged with hairs or cilia of a deep brown tinge. The prevailing colour, therefore, is brown. The moth, which measures rather more than two-thirds of an inch across the expanded wings, is common in Great Britain and usually appears in June and July, being often seen at dusk. The eggs are laid in July, and remain over the winter without hatching. The caterpillars may be found on Rose bushes in May and June, and are often very troublesome. In colour they are olive green, slightly paler towards the sides, with small black dots, visible through a lens, on each segment. The black dots bear fine hairs which

are not very obvious in the young stages. On the segment immediately behind the head is a dark dorsal plate. When full-fed the caterpillar measures two-thirds of an inch in length. The damage this caterpillar does is considerable. Not only does it eat holes in the leaves, but it also spins the leaves together and seriously hinders the proper development of the growing points. This injury is characteristic of the Tortricidae, and it is from this peculiarity of rolling the leaves together that the Latin name is derived. When touched or shaken the caterpillars wriggle actively backward and finally leave their home in the rolled-up leaves and drop to the ground, taking good care, however, to leave a rope of silk behind issuing from the silk glands in the mouth and attached to the plant at the other end. By this means they are enabled to attain their position when the danger has passed. Their depredations are not confined to the leaves, but they also bore into the developing flower bud, completely ruining the promise of the flower.

Spilonota (Notocelia) roborana, though not so common as the moth described above, is all too common for the Rose grower. It attacks Roses and also various species of Rubus besides Oaks and White Thorn. The forewings are white mixed with grey, with well-marked brownish spots on the wing edge. There is a dark brown basal patch near the wing attachment and a black triangular spot below the middle line towards the far margin of the wing, often with another black spot close above it. The far edge of the wing has brownish markings on a leaden grey background. The hind wings are whitish grey and the wing-expanse nearly two-thirds of an inch. Like the Common Tortrix, the wings are bordered with fine hairs or cilia.

The life history of the Brown Rose Grub is very similar to that of the moth just described. The adult appears in July and lays her eggs, which remain unhatched over the winter. In May and June the caterpillar appears. It is reddish-brown, with a light brown head and a black plate immediately behind. The damage done and its general behaviour is similar to that of the Common Tortrix. These two caterpillars are difficult to control owing to their living in the rolled-up leaves. On a small scale much good may be done by actively shaking the bushes, when many will drop to the ground, where they may be destroyed. Some, however, will remain in the rolled-up leaves, and especially in the growing points, and these may be dealt with by pinching the growing points between the finger and thumb. It is fairly easy to regulate the pressure so that the caterpillars are killed without injuring the growing tissues.

On a large scale, where hand methods are impossible, some good may be done in the early stages by spraying with lead arsenate paste at the rate of one pound to twenty gallons of water. The spraying should be thorough, as the larva will not eat sprayed foliage if it can find unsprayed, and it must be remembered that young unsprayed foliage is constantly being developed from the growing point. *A. H. Lees, Agric. and Hort. Research Station, Long Ashton, Bristol.*

THE MARKET FRUIT GARDEN.

GARDEN TRACTORS IN THE ORCHARD.

THE hoeing of fruit plantations this spring has, up to the time of writing, been practically money thrown away. No doubt it does some good to break the surface of the ground, but for weed-killing, which is the main object, the labour has been wasted, rain having reset the weeds almost immediately. This kind of thing must necessarily occur frequently in an industry which depends so much on the weather, and it ought to be taken into account by those who complain that agricultural wages still compare badly with those ruling in other industries. The factory hand can always be employed profitably; not so the farm worker. On many days since the beginning of this year it has been necessary to find make-shift, and quite unprofitable, jobs under cover simply to keep the men employed. But to return to the subject of hoeing. The heavy expense of keeping a gang almost continually at this work during the spring and summer, and at digging whenever the weather allows during winter, makes one long for new implements that would dispense with most of this hand labour.

As mentioned in some of my previous notes, I am satisfied that the fruit farm plough is a good substitute for digging wherever the trees allow of its use. I am now concerned to find an equally efficient alternative to hoeing. The horse cultivator is used, of course, wherever possible; but there are many places where the horses do too much damage to bloom and fruit. What is wanted is a tractor that is very low in build, light, and capable of turning on an ordinary headland

In the hope of finding such a machine as I have indicated, I recently attended a demonstration of an American-made garden tractor, at which large numbers of market growers were present. This implement is low, and is handled like a plough, the operator walking behind to control it instead of riding as in the case of a farm tractor. Such an implement could, of course, work close up to the trees, wherever a stooping man could contrive to get along. So far it fulfilled requirements: and most of the onlookers agreed that the idea is good. But this machine will have to be greatly improved before it will be widely adopted in this country. The chief fault is inadequate power. On loose, level ground it manages fairly well, though it is apparently very difficult to keep it straight; but on anything like a hard surface it makes a mere scratch. On hilly ground, such as some of mine is, it would probably be less.

It may be stated, however, we have the right idea here; and it is evident from the interest shown by fruit-growers and market gardeners that the makers will reap their reward if they are able to overcome the faults mentioned. One of the useful lessons taught us by the war is the great value of mechanical appliances, and their value is indeed great now that labour is scarce and dear. *Market Grower.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Big Bud Mite (see p. 231.—I should be glad to hear of any observed infection of the ornamental Currants (so-called American Currants) with big bud. *D.*

——I am obliged to Mr. A. H. Lees for so kindly sending me the pamphlet in regard to the experiments which have been carried out at Long Ashton with Black Currants and the Big Bud Mite pest which affects them. A perusal of this report shows that the methods adopted at the Somersetshire station are not effective, and I would recommend him to try the sprayings which I detailed in my last note. I observe in his reply to your correspondent *G. L.* (see p. 183) that he states: "Success has been claimed for repeated applications of a contact wash during the growing season. This, however, necessitates six to ten separate sprayings, and therefore is not economically possible, except in the case of nursery stock or in private gardens." I venture to disagree with Mr. Lees on this point. One of the largest and most important firms of fruit tree nurserymen make the following statement in their catalogue when recommending spraying at the times I noted in my last letter. They state: "Several large growers of Black Currants have completely eradicated this pest from their plantations by adopting this treatment." They further state that the remedy is simple, and not very costly, and for large plantations a knapsack sprayer is advised. I draw the attention of Mr. Lees to this statement. The spraying, even in the case of large plantations, is easily done, and I submit that it is not practical on the part of Mr. Lees to say that "it is not economically possible." The fruits of the Black Currant are worth money, and a good, clean crop will pay for a series of sprayings. *George M. Taylor, Edinburgh.*

FIG. 119.—ERYTHRONIUM REVOLUTUM: FLOWERS WHITE OR TINGED WITH PURPLE. (See page 242.)

What is a Broccoli?—The subject may be summarised with the question, "When is a Broccoli not a Broccoli, but a Cauliflower?" At any rate in English literature or practice no

definite lines seem to be laid down in the direction of making distinction between the two. Eventually it comes to the name printed upon the seed packet, which is hardly scientific even in the twentieth century. If we look to the dictionary we find no mention of Broccoli in Cotgrave (1650), and "Colly flory or Cypres Colewort," "Colli-florie or Colewort flowers" are given as equivalents of "Choux fleuris, fleurs and floris." The Oxford Dictionary derives Brocooli, or Brocoli, from the diminutive of "brocco," a shoot or stalk, and meaning Cabbage sprout or top, and defines it as a more robust and hardy variety of the Cauliflower, from which the white forms are hardly distinguishable. From the quotation from Pope (1732), "On Brocoli and mutton round the year," it is clear that the vegetable in variety must have been known then in this country. Turning to the French, Littré gives a similar derivation for "Brocoli" (which he spells with one "c"), "Chou d'Italie, petit rejeton que le tronc d'un vieux chou pousse après l'hiver." He gives an interesting quotation from Olivier de Serres (sixteenth century), showing that then the Cauliflower was hardly established in France; rather a contrast to the present time, for in 1907 two hundred tons a day were cut in the St. Omer district alone! He says, "Outre lesquels les Cauli flori (choux fleurs), ainsi dits des Italiens, encore assez rares en France, tiendront rang honorable au jardin pour leur délicatesse." One sometimes sees the prefix "cauli" derived from the Latin *caulis*, as meaning a stalk, but apparently this word was also used for the Cabbage itself. At the present time the terms Chou fleur and Chou Brocoli are commonly used, apparently an introduction since Littré wrote. It would seem likely that the earlier sorts of Broccoli must have been of the type which we know as "Sprouting Broccoli," from the white sorts of which the larger headed kinds may have arisen; such forms as Sutton's Bouquet may be a kind of halfway between the two forms. Vilmorin-Andrieux ("*Les Plantes Potagères*," 1904) distinguishes the Chou Broccoli from the Chou fleur as being endowed with longer vegetative period, so that instead of developing the head in the year of sowing it passes the winter and then "turns in" in the spring. Further, he describes the Broccoli as having usually more numerous leaves which are stiffer, and narrower than those of the Cauliflower. Also bare petioles, stronger and whiter veins, and in France usually smaller heads than the allied vegetable. Certainly there is a greater variation in the forms and shapes of the leaves of varieties which come under his definition of Broccoli, both in regard to shape and flatness than is the case amongst Cauliflower varieties that I have grown; also his remark concerning bareness of petiole is not borne out. There is a further sub-classification (given, for instance, by Vercler) of a more horticultural nature, and that is a division into a group with a harder or firmer texture of head and one with a tenderer or softer texture. If our horticultural authorities would establish some defined lines for grouping and sub-grouping the varieties it would make for progress. If we accept Vilmorin's main definition, the form we know as "Michaelmas White" and its immediate congeners should be called and staged as Cauliflowers and not as Broccoli. Thinking to get more vigorous plants by earlier sowing, I sowed this variety in September; it cropped about June. Sown in December and January, it cropped in July; sown in March or April, as usual, it crops about October; its cycle is about seven months. Some difficulty may arise in the case of other varieties which, after spring sowing, come into cut about Christmas, but much might be done in differentiation by trial sowings at different periods by those who are able to undertake trials on the large scale, and so, at any rate, attempt to introduce more law and order. No doubt others will sometimes have met with spring-sown individuals which did not form heads until a second winter had passed and another spring had arrived. This has happened to me in a few instances, but one usually has to clear the ground: although the plants are enormous the heads I have had have not been large. *H. E. Durham.*

SOCIETIES.

ROYAL HORTICULTURAL.

May 13.—A warm and brilliant day favoured the combined meeting of the Royal Horticultural Society and the British Carnation Society at the London Scottish Drill Hall, Buckingham Gate, on the above date. The exhibition was a very fine one, Carnations being the leading feature (see report of British Carnation Society), but Tulips were well represented, Orchids fairly numerous, Rhododendrons very brilliant, and alpines and flowering shrubs bright and interesting.

There was a large attendance of Fellows and visitors throughout the day, and the prospects of the Chelsea Show next week formed a general topic of conversation.

The Floral Committee granted four Awards of Merit and nine Medals; the Narcissus and Tulip Committee, one Gold Medal; the Fruit and Vegetable Committee made no award; and the Orchid Committee gave one Award of Merit and one Medal.

Floral Committee.

Present:—Messrs. Henry B. May (in the chair), S. Morris, G. Reuthe, John Heal, Geo. Harrow, John Green, W. Howe, J. F. McLeod, J. Jennings, J. W. Moorman, Chas. Dixon, John Dickson, Arthur Turner, Chas. E. Shea, James Hudson, E. H. Jenkins, E. F. Hazelton, C. R. Fielder, Chas. E. Pearson, Herbert Cowley, R. C. Notcutt, and A. J. Jackman.

Awards of Merit.

Rhododendron Gillii.—A gorgeously beautiful Rhododendron obtained by crossing R. Aucklandii with R. Thomsonii. The blooms are broadly campanulate, and the five-limbed spreading mouth is slightly waved. The colour is bright pink, with a heavy flushing of carmine-scarlet at the tips of the segments. The leaves are about 2½ inches broad and 8½ inches long, dark green above and pale green beneath. The flowers are carried in fine trusses, five to ten together.—Shown by Messrs. R. Gill & Son.

Trifolium uniflorum.—An interesting, low growing plant, suitable for the rock garden or moraine. The small, trifoliate, green, grey-marked leaves are borne at the ends of long, slender foot-stalks that are prostrate for half or more of their length. The flowers are small, bright rose, with whitish wings, short-stemmed, single and erect. They are clustered about the centre of the plant, and there may be as many as 30-50 open at the same time.—Shown by Messrs. W. Wells & Co.

Primula Auricula O'Bristii.—A showy and strong growing plant that may be described as a very finely formed and robust yellow alpine Auricula. The ample leaves suggest a robust constitution. The flowers are an inch and a quarter across, flattish, with wavy margins to the segments. There were 20 fragrant flowers in the larger truss. We understand this is a wild alpine form of P. Auricula, and that it comes true from seed.—Shown by Mr. T. Temple West, Gatton Point, Redhill.

Ramondia serbica (Nataliae) alba.—A charming alpine and a pure white-flowered counterpart of the type illustrated in *Gard. Chron.*, April 26, 1919 (Fig 93).—Shown by Mr. T. Temple West, Gatton Point, Reigate.

Groups.

Roses exhibited by Messrs. B. R. Cant & Sons were greatly admired; Mdme. E. Herriot, Cupid, Lady Pirrie, Golden Ophelia and Covent Garden were outstanding varieties, the last being in fine condition, its bright crimson and fragrant blooms attracting much attention (Silver Flora Medal). The Rev. J. H. Pemberton exhibited his new bedding Rose named Joan, a cream-coloured, pink-flushed dwarf variety, said to be good in autumn, but, as shown, rather a weak grower. A beautiful group of Roses was arranged by Mr. Elisha Hicks, who exhibited lovely flowers of climbing Lady Hillingdon, Mrs. Elisha Hicks (very fragrant), Joanna Bridge, Mrs. George Norwood, Mdme. E. Herriot, Rosa Moyesii, and R. Hugonis, the latter a charming, free-flowering buff-coloured species (Silver Banksian Medal).

Messrs. R. Gill & Son contributed a handsome group of Rhododendrons associated with vases of Embothrium coccineum, and Pieris formosa. Of the Rhododendrons some of the finest were R. Falconeri, R. Roylei, R. campylocarpum, R. Aucklandii (very fine), R. Beauty of Tremough, R. Gillii (see Awards), and the charming, light, pearly pink R. Richard Gill (Silver Banksian Medal). A considerable number of interesting plants were to be seen in Mr. Reuthe's group; we noted Magnolia Lennei, Viburnum Carlesii, Camellias, Rhododendron Falconeri, the purplish mauve R. Albrechtii, and the neat little R. glaucum (Bronze Flora Medal).

Messrs. Reamsbottom & Co. sent a selection of their brilliant-hued St. Brigid Anemones (Bronze Flora Medal). Saxifrages, a fine strain of yellow Polyanthuses, Aubrietias and Violas were largely shown by Mr. G. W. Miller (Bronze Banksian Medal). Mr. Clarence Elliott's small exhibit included about fifty plants of Primula Ruby, a neat P. viscosa hybrid, with ruby red and white-eyed flowers and a group of Gentiana verna flowers of the most vivid blue (Bronze Banksian Medal)

Spring flowering trees and shrubs were shown by Messrs. J. Cheal & Sons, who staged freely blossomed branches of Pyrus Malus floribunda, P. Niedzwetzkyana, Cydonias in variety, Prunus serrulata pendula, P. Aoium flore-plena, Amelanchiers, Spiraea arguta, Genista purgans, Magnolia Lennei and Berberis Darwinii (Silver Banksian Medal.)

Blue, pink and white Hydrangeas, with Verbenas and Ivy-leaved Pelargoniums and Calceolarias were arranged with ferns by Messrs. H. B. May & Son (Silver Banksian Medal). The Beacon strain of Primula obconica, with large flowers carried in large trusses on stout stems, was exhibited by Messrs. Bufford & Patrick, Ditchling.

Orchid Committee.

Present:—Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), W. Bolton, Arthur Dye, Pantia Ralli, Frederick J. Hanbury, R. A. Rolfe, Walter Cobb, W. H. Hatcher, and Fred. Sander.

Award of Merit.

Odontioda Zampa Rosslyn variety (*Cooksoniae × Coronation*) from H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood). A pretty and attractively coloured hybrid, in which the O ardentissimum in Oda. Cooksoniae influences the shape, the O. Pescatorei in O. ardentissimum being clearly defined in the labellum of the hybrid. The plant bears a strong spike of finely-formed flowers, the ground colour of which is bright rose, the inner two-thirds of the segments being red, with a thin white band between the blotches. The lip is blush white with a strong yellow crest, around which are some reddish-purple markings.

Groups.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Flora Medal for a group with the elegant scarlet Epidendrum radicans and plants of the now rare E. Wallisii, and other of the slender-stemmed Epidendrums at the back. Specially attractive in the group were the new Odontoglossum The Tiger, a very large flower of the white Pacho type; O. crispum var. Avalanche and the very dark O. General Allenby. In the centre were the handsome new Brasso-Cattleya Princess Mary (B. C. Digbyano-Schröderae × C. chocoensis alba), with a fine pure white flower having a deep orange disc to the fringed white labellum, the pure white Cattleya Mary Sander, Miltonia Charlesworthii in two very large varieties, and a selection of rare species, including Chondrorhyncha Chestertonii, Bulbophyllum Lobbii, pink Cynorchis, Cypripedum glaucophyllum and Odontoglossum crispum Oakfield Sunrise (see Fig. 120), with two spikes, the seemingly abnormal flowers displaying in the quaintly coloured petals a marked

step between the white type and the blotched forms, to which reference is made on page 236.

A. J. HOLLINGTON, Esq., Forty Hill, Enfield (gr. Mr. W. May), showed Laelio-Cattleya San Juan (C. Mendelii × L.-C. Aphrodite) a pretty flower nearest to L.-C. Aphrodite, with white sepals and petals tinged with lilac, and purple lip with a yellow disc.

Narcissus Committee.

Present:—Messrs. Peter R. Barr (in the chair), W. Poupart, H. V. Warrender, W. B. Cranfield, Geo Munro, jun., J. Duncan Pearson, Rev. J. Jacob, and Miss E. Willmott, and C. H. Curtis (hon. secretary).

The large exhibit of May flowering and Darwin Tulips arranged by Messrs. BARR & SONS was awarded a Gold Medal. It was a fine effort, and if the flowers were a little on the small side they were wonderfully fresh, clean and bright. Some improvement in the association of the colours might have been made from the point of view of general effect. Among the finer varieties were Airs Kennicot, Klopstock, Le Rêve, Miss Jekyll, Clara Butt, fulgens, Rose Tendre, Garibaldi, May Queen, Solfaterre, Psyche, the very attractive Sunlight, Velvet King, and Phyllis.

The Rev. G. H. ENGLEHEART displayed about a dozen and a half of new Narcissi, chiefly poeticus varieties of excellent size and form, but all unnamed.

Fruit and Vegetable Committee.

Present:—Messrs. C. G. A. Nix (chairman), Jas. Cheal, W. Bates, A. R. Allan, F. Jordan, W. J. Jefferies, H. Markham, A. Bullock, Owen Thomas, Geo. F. Tinley, W. H. Divers, A. E. Vidler, G. Reynolds, and Rev. W. Wilks.

A dish of Onion Giant Zittau, raised from seed sown in March, 1918, was exhibited by Mr. S. HARRINGTON, Faulk Bourne, Witham, Essex. The bulbs were flattish and of medium size, and represented a portion of a crop of two hundredweight grown on a two-rod plot. Mr. EDWIN BECKETT, Aldenham House Gardens, brought some very fine specimens of Dumelow's Seedling (Wellington) Apples. The fruits were of a higher colour than usual, and in splendid condition for so late in the season. The Rev. W. WILKS, Shirley, brought cooked Rhubarb Tobolsk for the Committee to taste. The variety is one of the very darkest in colour, and is dwarf in habit, while the flavour is, in the opinion of many, superior to that of any other variety of Rhubarb.

SCOTTISH HORTICULTURAL.

MAY 6.—The monthly meeting of members was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Fife, the President, occupied the chair, and there was an attendance of 65 members.

Dr. John H. Wilson, St. Andrews University, gave a lecture, illustrated by lantern slides and a fine collection of dried plant specimens, on the scenery and vegetation of Australia He had had opportunity of making notes in all the six states of the Commonwealth. Australia, he said, had suffered very little geological change for an extremely long period. The plants which had originally found a home in it had had ample time to develop characters which differentiated them from those of neighbouring geographical regions, Australia being the only home of certain groups, while in many cases it was the headquarters of groups which were represented by very few species elsewhere. The isolation in respect of endemic species was most pronounced in the western and south-western parts of the continent. In Queensland, and in the eastern side, there was a fair sprinkling of species which were to be met with in regions with which presumably there had existed a land connection in remote times. In seeking explanation of the problems bearing on the peculiarities of the native vegetation, climatological factors had to be added to the geographical and geological ones, and of those rainfall was of the greatest importance. Australia was very poorly provided with mountain chains, and the centre of the continent was a desert. The heaviest rainfall occurred on the coastal regions. In most parts with heavy annual rainfall the fall was apt to be torrential at times, with alternating periods of severe drought. The vegetation in most parts of the continent was characterised by features showing adaptation to withstand protracted desiccation. In Queensland grand coastal forest was being ruthlessly destroyed to make room for Pineapples and Oranges. The rainfall being ample, and the climate subtropical, the vegetation of the regions in question was luxuriant, rich and varied. Plants familiar to us in greenhouses at home were to be found in numbers, including several favourite Palms and Ferns. The Stag-horn and Bird's-nest Ferns clung in masses high up on the stems of Eucalyptus and other trees. In journeying, one crossed at points the track of Allan Cunningham, the botanical explorer, whose name was intimately associated with many of our garden plants. To the forester the giant trees, such as the Hoop Pine (Araucaria Cunninghamii), were of special interest. Caution had to be observed when the innocent-looking Laportea (Nettle Tree) overhung the narrow road ways through the forests. There was much in the flora of both New South Wales and Victoria of interest to gardeners. In the Botanic Gardens at Sydney and Melbourne, but especially in the former, one could realise in some measure the floral wealth of the respective states, and appreciate the aesthetic possibilities arising from the introduction of plants from other countries. In Tasmania the traveller found the climate more like that of our own. The flora included nearly seventy native plants which were identical with British species. On Mount Wellington, near Hobart, a mountain of over 4,000 ft., the vegetation was particularly interesting. The moorlands were quite devoid of Heaths, but heather-like plants (Boronia, &c.) were abundant. Many of the plants recalled the wanderings of the great Scottish botanist, Robert Brown, who had explored the district. The Huon forests of Blue-gum and Stringy-bark (Eucalyptus) trees were composed of magnificent timber. In the more open parts there was a fine undergrowth of Tree-ferns and flowering shrubs, many of which added beauty to indoor gardening at home. Nothing could exceed the charm of the Tree-ferns, with their fronds festooned with white Clematis. Returning to Victoria, Mildura, a settlement in the Murray River, was visited. There the native vegetation, designated "bluebush," consisted of plants adapted to assimilate saline substances by the roots. Irrigation with fresh water from the Murray River rendered the soil suitable for the successful cultivation of fruits. The banks of the Murray River were clothed for a long distance with grey-leaved Gum-trees, a class of vegetation seldom out of the picture anywhere in Australia. Great tracts were covered with "Mallee Scrub," the name being applied to branching Eucalyptus which did not assume the form of trees. At Adelaide, as in many other places, noteworthy instances were met with of the danger of introduced plants becoming weeds. There the Globe Artichoke was to be seen in masses boldly decorative in full flower. In New South Wales the Sweet Briar was a pest; in Victoria the perforated St. John's-wort, and in Queensland the Prickly Pear. At Albany, in Western Australia, the botanist again followed the steps of Robert Brown, who in 1802 spent three weeks at St. George's Sound. The scrub on the shore near the town was an open thicket of highly interesting plants, mostly shrubs provided with means of defying drought, the leaves being much reduced in size, or dry and hard. The flowers were unusually showy. In damper portions of the ground the pitcher plant, Cephalotus, found a home. It occurred nowhere else but in that corner of Australia. Examples of the curious Trigger plants (Stylidium) were noted, a family represented in Western Australia by no fewer than over sixty species, nearly all endemic. The so-called Christmas tree (Nuytsia) was a splendid object when in full bloom, being a mass of glowing orange colour. At points well within the State sand plains were encountered. It was astonishing to find tracts which seemed to be deserts clothed with an exceedingly robust and varied vegetation, obviously adapted for subsisting on a minimum supply of water. Our gardens are indebted to the Australian flora for many highly attractive plants, and at one time a much larger variety was grown. Round many of them clung the memory of the daring and enthusiasm of the early explorers of Australia.

The exhibits were:—Seedling hybrid Daffodils from Mr. William Cuthbertson, J.P., V.M.H., Maitland Lodge, Duddingston; Greenhouse Rhododendrons from Mr. D. Macdonald, Trinity Cottage Gardens, Edinburgh; Rhododendrons from Mr. J. Billton, Melville Castle Gardens, Lasswade; and Cinerarias from Mr. J. W. Sword, Inveralmond Gardens, Cramond.

FIG. 120.—ODONTOGLOSSUM CRISPUM "OAKFIELD SUNRISE."
(See page 244.)

BRITISH CARNATION.

MAY 13.—The twenty-third show of perpetual-flowering Carnations, which was held at the Drill Hall on this date, was especially successful in regard to the high quality of the exhibits. Competitors were comparatively few, but the fine trade exhibits of splendid blooms contributed greatly towards making a memorable show. No certificate was awarded to a novelty, but the three British raised seedlings which the Misses PRYCE and FYFE staged in Class 2 show that home raisers can produce new varieties of the highest quality. All are of good form, and possess the indispensable quality of fragrance. Isobel Felton is a pure white variety, and of that delightful round shape that appeals alike to the old-style florist as well as present-day decorators. Scarlet Dragon possesses glowing colour, and Alison is a charming soft pink. It would add to the value of future shows if the scope of each class was indicated on the class cards.

OPEN COMPETITIVE CLASSES.

Mr. C. ENGLEMANN, Saffron Walden, was the only exhibitor in Class 1, but he was deservedly awarded the George Monro, Jun., Challenge Cup for a splendid collection which included ex-

ceedingly good vases of Carola, Scarlet Carola, Coquette and Cierce. Mr. Englemann was also awarded the American Challenge Cup for 12 blooms each of three American novelties. He showed Belle Washburn, deep scarlet, Matchless, white, and Peerless, light cerise; but it must be confessed that these are no advance on standard varieties. The Brunton Cup, offered for 12 blooms of three British novelties, was won by the Misses PRYCE and FYFE, Birchgrove, who staged splendid vases of Scarlet Dragon, Alison and Isobel Felton, the three varieties we have already referred to. Mr. ENGLEMANN, who was second, had a splendid vase of Variegated Carola.

AMATEURS' CLASSES.

There was only one group of Perpetual-flowering Carnations, but it was an especially good one, and deserved the Lord Howard de Walden Challenge Cup, which was awarded to C. A. CAIN, Esq. (gr. Mr. F. Pateman), The Node, Welwyn, Herts. The plants were well-grown and healthy, and the blooms of first size, the outer row of Carola being especially attractive.

The best vase of Pink Sensation was arranged by Mr. M. SARGENT, gardener to D. Stoner Crowther, Esq., Hay Green, Kingston Hill, and the first prize for a vase of 12 blooms in three varieties was awarded to C. A. CAIN, Esq., for an equally good display.

NON-COMPETITIVE EXHIBITS.

Mr. C. ENGLEMANN set up an amazingly fine exhibit, both as regards size and quality. Rarely have so many generous vases of splendid blooms been shown. Where all were so excellent it becomes difficult to make special mention, though the vases Carola and its scarlet and fancy sports, Salmon Enchantress, White Wonder, and the glowing scarlet Mars may be named as being the very best of the perpetuals, though Mrs. C. F. Raphael, the popular perpetual Malmaison, was most magnificent (Gold Medal).

Messrs. STUART LOW & Co. made a speciality of the fragrant perpetual Malmaison varieties, and included charming vases of Hon. Charlotte Knollys, Mrs. Myles Kennedy, and the fancy Mephisto, though their perpetuals were also of great merit (Silver Gilt Medal).

A very tasteful arrangement was made by Messrs. KEITH LUXFORD & Co., new exhibitors at these shows. Their vases of Enchantress Supreme and White Wonder were particularly good (Silver Medal).

Messrs. W. CUTHBUSH & SON included fresh and good examples of Mrs. C. F. Raphael, Lady Ingestre and Marmion, while Messrs. ALLWOOD BROS. made an especial feature of Wivelsfield Beauty, a pale yellow, delicately flaked with salmon, and the fancy Marian Willcox (Silver Medal). Misses PRYCE and FYFE had a beautiful arrangement of such sorts as Maisie, Carola and Malcolm (Silver Gilt Medal).

NATIONAL TULIP.

MAY 13.—The annual show of the National Tulip Society, which was held in conjunction with the R.H.S. Meeting at the Drill Hall on this date, was very poor from almost every point of view. Undoubtedly the date was too early for many growers. There were only two exhibitors, and the arrangements, even for the few exhibits that were forthcoming, were not at all satisfactory. The society cannot hope to increase either its membership or influence when there is nothing to inform the visitor as to the objects and scope of the various classes, nor any indication that it is the show of a separate society.

Mr. W. O. SULLIVAN, Tooting Common, was awarded the first prizes in Classes 1 and 6, and there was no other amateur exhibitor. The first class was apparently for 12 vases of Darwin Tulips, and Class 6 appeared to be for 6 vases of Darwin and Cottage varieties mixed. The best Darwins were Marconi, William Pitt, and Velvet King.

Messrs. BARR & SONS were awarded the first prize for three vases of Rembrandt Tulips; they showed good examples of Caracalla, Lola and Rasotra. This firm had also a good non-competitive exhibit of Tulips.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

The monthly meeting of this Society was held at the R.H.S. Hall, on the 12th inst. Mr. C. H. Curtis presided. Three members were allowed to withdraw double the amount of their interest from their deposit account, amounting to £3 11s. 4d., and one member over the age of 70 years withdrew £60 6s. 7d. from his deposit account. The sick pay for the month on the ordinary side amounted to £69 8s. 4d., and on the State section to £26 8s.; while maternity claims came to £4 10s.

The financial statement was read by the treasurer, who reported that the trustees had invested a further £500 in War Bonds. The secretary also reported that the Society's books for the State section had been audited by the Government auditors up to March 31, 1919. The next committee meeting will be held on June 2, at 7 p.m.

Obituary.

H. J. Mash.—We regret to learn that Mr. H. J. Mash, of Messrs. Mash and Austin, Covent Garden, died on Sunday last, at Cookham Dene, Cookham. The deceased gentleman was as widely known in commercial horticultural circles for his generosity and kindly disposition as for his great business ability. He was sixty nine years of age, and had retired from active participation in business. The remains were laid to rest at Cookham on Thursday, the 15th inst.

TRADE NOTES.

A well attended private meeting of fruit growers, under the auspices of the Chamber of Horticulture, was held at the Central Hall, Westminster, on Friday, the 9th inst. Mr. W. G. Lobjoit, J.P., presided. In the course of a free discussion on the regulation of imports the views of growers, distributors and retailers were well represented, and the following resolutions were carried unanimously:—(1) "That measures be taken so to regulate imports of foreign fruit and vegetables as to prevent the forcing down of prices of home-grown produce to unremunerative rates: a process which in the past has frequently resulted in waste, and has discouraged production." (2) "That it is essential in periods of maximum production that special low railway rates be fixed for the conveyance of produce loaded in bulk; and that no restrictions upon the sending of produce from one part of the kingdom to any other part of the kingdom should be established." (3) "That the railway companies be requested to increase facilities for the transport of fruit and vegetables by providing fast and regular goods services for the conveyance of produce to market centres, and that where fast trains are impossible to arrange, preference shall be given to all perishable fruit and vegetables." These resolutions have been referred to the Chamber of Horticulture.

Messrs. Thomas Methven and Sons, Edinburgh, have again been entrusted with the floral decorations at Holyrood Palace during the residence of His Grace the Lord High Commissioner.

ANSWERS TO CORRESPONDENTS.

ADDRESS WANTED.—Will Mr. J. Coombes, the contributor of the article on the Cultivation of the Pear in France, kindly send his present address to the Publisher of the *Gardeners' Chronicle*, 41, Wellington Street, London, W.C.2.?

AN ENQUIRER: *Tomato House.* If you propose to erect a Tomato house for commercial purposes we suggest that one about 200 feet long and 30 feet wide would be most suitable, and on the whole most economical for working. Longer and wider houses entail much extra labour, and also greater endurance on the part of the cultivator than a smaller house. Each side should have ventilators along the top about 6 ft. to 8 ft. apart, and there should also be several along the sides, as it is important to secure free circulation of fresh air, not only to assist better pollination of the flowers, but to make the stem and leaf tissues firm and hard, and therefore more disease-resisting. The best position for the house to run would be north-east and south-west, so as to catch the sun for the longest possible period, and also to offer less resistance to the south-westerly gales, which, in some districts, do great damage in blowing out the glass and tearing off the ventilators when the houses run east and west. As to cost, at the present time it would probably cost from £350 to £400 to build a Tomato house 200 ft. long and 30 ft. wide. If a boiler and pipes are added another £100 or more would probably have to be spent. On this question, however, it would be better to obtain an estimate from one of the recognised horticultural builders, whose addresses will be found in our advertisement columns.

INTUMESCENCE ON VINE LEAVES: *B.* The warty appearance of the under sides of the vine leaves is due to the extravasation of sap through the skin of the leaf. The cause is to be found in some physiological disorder, aggravated probably by a too close and warm atmosphere. Pay careful attention to ventilation, and begin to admit air very early in the morning on warm days.

NAMES OF PLANTS: *F. P. Dickson.* (1) Ilex aquifolium var. scotica; (2) I. a var. ciliata; (3) I. a. var. maderensis; (4) I. a. var. donningtonensis; (5) Phillyrea decora. *T. C. S.* (1) Amelancher canadensis; (2) Acer japonicum var. laciniatum; (3) Grevillea rosmarinifolia; (4) Pyrus floribunda var. Halleana. *Miss P.* So far as can be determined from such a poor specimen, the plant is probably Primula rotundifolia. *T. H.* Ribes aureum. *C. E. D.* The Carnation is apparently a small flower of the perpetual-flowering variety named Carola.

PLANTS FOR HANGING BASKETS: *Huddersfield.* Basket plants suitable for hanging under a verandah include Ivy-leaved Pelargoniums, Asparagus Sprengeri, Fuchsias, especially those of a drooping habit, Mrs. Roberts being one of the best for this purpose; Lobelias with a spreading habit, such as Sapphire; Petunias, Begonias, and Campanulas.

ROSES INJURED BY INSECTS: *T. H. E.* The Roses are attacked by a species of thrips, and the brown discolouration of the petals is characteristic of the damage caused by those insects. The black insect referred to is the winged adult stage, but besides these there are nymphs and larvae to be found between the petals. These two stages are almost colourless and practically invisible to the naked eye, but have a large part in the damage caused to the bloom. Since they shelter within the petals an ordinary fumigation is apt to fail to kill them all, and it would be thus advisable to try another fumigation, using as large a concentration as the Roses will stand and, above all, allowing the longest possible time for the vapour to penetrate. Ordinary insecticides are not likely to do much good, since they will only reach insects feeding on the outsides of the petal. A second fumigation should be made ten days after the first in order to kill any larvae that have hatched from unkilled eggs. Beware of using carbolic preparations on green plant tissue, as they are very liable to cause scorching.

Messrs. JOHN WATERER, SONS & CRISP, LTD.

Beg to inform their numerous customers that they are not holding their large exhibition of Rhododendrons in London this season owing to the difficulties of labour and transport, but they anticipate having one of the finest shows of Rhododendrons and other flowering shrubs that have been seen in their Nurseries at Bagshot for many years. These will be in their full beauty from now onwards for another three weeks.

The Nurseries are easily reached from London by rail direct from Waterloo to Bagshot station, from which they are half a mile distant, or by motor, the Nurseries are some 26 miles from Hyde Park Corner on the main road.

At the Twyford Nurseries, which are situated on the main Bath road 1½ miles from Twyford station, we have grand collections of Alpine and Herbaceous plants, Roses, Fruit Trees, and many hundreds of thousands of May flowering Tulips. These will be in their full beauty the coming week. We cordially invite inspection of both Nurseries, and feel confident that visitors will find much to interest them in the many new and beautiful plants that we grow.

JOHN WATERER, SONS & CRISP, LIMITED,

The Nurseries, BAGSHOT, Surrey.
The Nurseries, TWYFORD, Berks.

MARKETS.

COVENT GARDEN, May 14.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Plants in Pots, &c.: Average Wholesale Prices.

(All 48's, per doz. except where otherwise stated.)

	s. d. s. d.		s. d. s. d.

		— white	1 6– 2 6
		— yellow... ...	1 6– 2 6
		Violas, per doz. bun.	4 0– 6 0

REMARKS.—Daffodils have finished quickly with the sunny weather; small consignments of these flowers, chiefly the variety Emperor arrived from Scotland during the past week. Narcissus Ornatus is now replaced by N. Poeticus from home growers, including Cornwall and the Channel Islands. The first consignment of Narcissus flore plena (double white) arrived on Friday and Saturday last, and were greatly appreciated by florists; the blooms were soon sold at 1s. and 1s. 3d. per bunch. Gypsophila elegans from home growers is selling freely and several baskets of this flower arrived from France last week-end but the spikes were in bad condition and quite unsaleable. Roses and Carnations are well supplied in the usual sorts, Spanish Irises are increasing in quantity, also Sweet Peas and Gladioli, including a few bunches of Blushing Bride variety. Gardenias are taking the place of Camellias which are now finished; the former are packed in boxes containing 12 to 18 blooms, the "twelves" being selected blooms. Darwin Tulips were almost a glut last week-end.

Mint, per doz. bun.	3 0– 4 0		
Mushrooms per lb.	3 0– 3 6		

REMARKS.—About 300,000 cases of Tasmanian Apples are due to arrive this week. English hot house fruits now on offer consist of the following: Black Hamburgh and Muscat of Alexandria Grapes; Peaches, Figs, Melons and Strawberries. Belgian Grapes and Peaches are also on offer. Rhubarb is fairly plentiful, and is being sold at record prices. The season for Continental Asparagus is closing but English Asparagus is much more plentiful, notably from the Worcester district. English Tomatos are an increased quantity, and the market is well supplied with Cucumbers. Cabbages and Cauliflowers are scarce. Mushrooms are a fairly good supply.

THE WEATHER.

THE WEATHER IN SCOTLAND.

The opening days of April were cold, but on the 4th the temperature rose considerably and maintained a fairly high level till the 26th, when there was a sudden drop, which culminated in the severe blizzard of the 27th. On the latter day snow fell continuously from 10.15 a.m. to 2 p.m. (G.M.T.), and was followed on the 28th by a northerly gale with sleet and rain. The rainfall for the month was 2.20 inches distributed over 12 days of precipitation; of these 7 were official "rain days." The heaviest fall was that of the 27th with 0.69 inch. Of sunshine we had in all 134.1 hours, being an average of 4.47 hours per day and a percentage of 31.9; the 20th was the brightest day with 11 hours. For the month the mean barometric pressure was 29.87 inches with a highest of 30.73 inches on the 20th and a lowest of 28.90 inches on the 15th. Temperature—the highest maximum was 62° on the 18th, and the lowest minimum 23° on the 2nd The lowest maximum was 40° on the 27th, and the highest minimum 48° on the 7th and 19th, while the mean maximum and minimum were 52° and 36° respectively. From these data we obtain a mean temperature of 44°, a mean range of 16°, and an absolute range of 39°. On seven nights the temperature fell below 32°. For the dry bulb thermometer the mean was 45.5°, and for the wet bulb 42.2°, giving a relative humidity of 77 per cent. On the grass the mean minimum was 31°, with the lowest of 19° on the 27th; there were 14 nights of ground frost. At one foot deep the soil temperature rose from 36° to 44° and then fell to 43°. The prevailing winds were westerly. *James Malloch, Director of Studies, Training College Gardens, Kirkton of Mains, near Dundee.*

NOW IS THE TIME TO PLANT.
KELWAY'S LOVELY GLADIOLI FOR AUTUMN FLOWERS.

KELWAY'S FAMOUS GLADIOLI, planted now, produce grand spikes of glorious flowers from August until late Autumn. They are particularly useful for Church decoration during Harvest Festivals, for large Halls and Hospitals, and for decorating the Home when other flowers are scarce.

Extract from a letter from the Rev. ——, —— Rectory, Swanton Abbot, Norwich:—

11-4-19.

"Dear Sirs,—I had a quantity of Gladioli of you a few years ago, and on 2 or 3 occasions in fact—and they have done remarkably well, and have been of great use for cutting for church decoration. The last 3 or 4 years I have required practically nothing else from about the middle of July to October."

They will grow in towns, and we can supply them in all colours for planting now. Do not buy Dutch bulbs but send at once for our special Price List of named sorts to the Retail Plant Department, KELWAY & SON, the Royal Horticulturists, Langport, Somerset.

DICKSON & ROBINSON'S No. 4 POTATO KNAPSACK SPRAYING MACHINE.

This is the strongest and best finished spraying machine on the market. It has all the latest improvements embodied in it. There is nothing to get out of working order. All the fitments are interchangeable, and can be renewed immediately. The container (or tank) is made of polished copper: and the pump (which is on the outside), the valve box, air chamber, and fittings are all of brass. Each sprayer is complete with brass strainer, and special double swivel nozzle for potato spraying, etc. The nozzle can be turned in any direction desired, and is specially adapted for spraying UNDER the foliage. It has 39 inches of best quality hose into which is screwed lance complete with tap. The machine fits on the shoulder like a soldier's knapsack. For use, also, spraying Vines, Fruit Trees, Hops, etc.

85/-.
PACKED FREE and CARRIAGE PAID.

ENTERPRISE

clip bracket

introduced for the Purpose of training or supporting Vines, Creepers, Tomato Plants, Plants and Cuttings of all Varieties

IT DOES AWAY WITH THE

old way of tying with string: often detrimental to the plant. All it is necessary to do is, place the clip on stick at the desired spot and place plant in clip. As the plant grows the clip can be moved on stick. Made in various sizes for different sized sticks.

Nurserymen, Gardeners & Amateurs

will find this clip bracket most useful and labour-saving—in fact, it **combines work with Pleasure, Ease and Comfort.**

Per **12/-** Gross

Carriage paid on all orders of £2 to any part of the United Kingdom. Smaller lots at 1/- per dozen and postage 3d. per dozen extra.

HORTICULTURAL LIBRARIES IN THE UNITED STATES.

AMONG the libraries in the U.S.A. which have specialised on horticulture, that of the Massachusetts Horticultural Society is probably the most widely known, but while it is the sole example of a large library devoted exclusively to this subject, there are other notable collections, and that of the United States Department of Agriculture at Washington must be a close second in the importance of its horticultural resources, if indeed it does not actually contain the largest number of books relating to the subject.

While it comprises an exceptionally fine collection of works relating specifically to agriculture and gardening, it is essentially a scientific rather than an agricultural library in the limited sense, being very rich in the sciences fundamental to agriculture, such as botany, chemistry, bacteriology and entomology. Hence it follows that many works appropriate to a purely horticultural library are classed by the Department of Agriculture with special sciences, and do not count as part of its horticultural collection, which may consequently appear less important than is actually the case. Many works, such as the herbals of Gerarde, Dodoens, Clusius and others, are found in the botanical classes of the Department Library, as are also such illustrated books without texts, as the *Theatrum Florae* (1622), and various monographs of genera, like Miss Willmott's *Rosa* and W. R. Dykes' *Iris*. It is difficult to single out from the horticultural literature any groups which are particularly noteworthy, but special mention should perhaps be made of the nursery and seed trade catalogues, of which the Department of Agriculture has a valuable and rapidly growing collection, probably second only in importance to that of the Massachusetts Horticultural Society, and which is being constantly and extensively used in the horticultural work of the Department. While it contains few originals of very early issues, it does include a photostat copy of Robert Furber's, supposed to be the first trade catalogue ever separately published; also photostats of the first one known to have been issued in the United States, that of William Prince, published August, 1771, and of one from a less well-known dealer, Minton Collins, of Richmond, Virginia, whose broadside list of "Garden and grass seeds" was issued January 24, 1793. The latter year is also the date of a little 16mo catalogue of "Fine double hyacinth and other curious flower roots and seeds, imported chiefly from Holland, France, America, Italy, Botany Bay, etc., by John Mason, Orange Tree, 152, Fleet Street," which turned up among some miscellaneous pamphlets a short time ago. Of horticultural periodicals, the Department has an excellent working collection; though still lacking, or having incomplete sets of a number of important Continental journals, it has most of the English, as well as the American ones. One of the most complete sections of the library is that devoted to pomology, which has apparently been built up with considerable discretion and foresight since an early period in the history of the library, as it contains nearly all the important works, and exhibits few serious omissions.

While it is the primary aim of the library to meet the vast current requirements of the scientific and statistical researches of the Department, it has kept clearly in view the fact that its collections, located at the nation's capital and fostered by the Government, should properly comprise all literature relating to agriculture and horticulture. With this end in view the library has latterly been making a special effort to acquire the agricultural classics, and while it does not pretend to buy incunabula, and is in no position to compete with wealthy private collectors for the possession of specially fine editions, it has obtained a goodly number of 16th century books: several editions of the *Scriptores Rei Rusticae* and *Geoponika*; of Herrera and Crescenzi, as well as many of the latter's Italian successors: Gallo's *"Dieci [—vinti] giornale dell' agricoltura"*; Clemente; Bussato; Porta's *"Villae libri XII"*; Sansovino; Vettori on the Olive; Soderini on the Vine, etc. Another work which ought to be included in this group was not actually published until 1776; the *"Discorso dell' agricoltura di Giovambatista Tedaldi"* (1495-1575), which is in the Library of Congress. The Department Library has also what is probably the fullest collection of early American agricultural works.

No account of the Library of the United States Department of Agriculture would be quite complete without mentioning its relation to the Library of Congress, which lends to the various Government libraries with great liberality, and maintains a delivery service in Washington whereby any books needed from there can be brought to one's desk almost as promptly as if located in the Department Library itself. While the books on agriculture and gardening form but a relatively small proportion of the total collection of the big national library, their number is actually very considerable, and includes not only the majority of books published in the United States, but also many rare old agricultural treatises, particularly those by early English writers. Owing to their accessibility these collections may be regarded as complementing those of the Department of Agriculture, which accordingly makes it a general practice when buying old books for their historical or bibliographical interest (as compared with those directly bearing on current scientific research), to avoid duplicating editions already located in the Library of Congress, and this practice is to a considerable extent reciprocal. It is obviously in the interest of efficiency that the different libraries of a given city or section should specialise so far as possible in respect to works not in general demand, and there are many instances of this kind of co-operation in American cities. By depending on the Library of Congress very largely for works of general or diversified interest, the Department of Agriculture is enabled to define its own scope more consistently and more fully develop the collections along its own special lines. There is one field of horticultural research in particular in which it is enormously indebted to the Library of Congress, namely, collateral information on the origin, introduction and naturalisation of plants, which is to be found in the literature of history, biography, geographical description and exploration, as well as the highly important sources to be sought in personal maunscripts and old state documents. In the field of periodical literature and the publications of learned societies, the collections of the Department are very largely supplemented by those of other libraries in the city of Washington.

No one, however, who knows the Department library through extended use can regard it solely as a collection of books. While the Librarian, Miss C. R. Barnett, gives great care to book-buying as a vital part of the whole scheme, the central idea of the library, clearly shown in all its manifold relations, is that of service; every facility is developed to make its collection of use and value to its users, with the result that the latter acquire implicit confidence in the library's ability to supply all their needs, and rarely does it occur that a book or reference is required which the library cannot in some way supply, though perhaps not without some lapse of time in case of works difficult to identify, or which must be borrowed from a distant city. Moreover, as in all modern library work there is frequent demand for information not even to be had in print, it is evident that the sphere of the Department of Agriculture Library is by no means limited to the literature it contains, but is a vital factor in innumerable activities of the Department.—*M. F. Warner, Bureau of Plant Industry, Dept. of Agriculture, Washington, D.C.*

RUBUS GIRALDIANUS.

Amongst the numerous species of Rubus introduced by Mr. E. H. Wilson from China, R. Giraldianus (see Fig. 121) is one of the most effective and distinct. It is the best of the white-stemmed Brambles and may be recommended to those who like curious and bizarre winter effects in the garden. It may be necessary sometimes to explain that the whiteness is due to a waxy exudation on the bark. The plant illustrated in Fig. 121 is growing in a border of Chinese Rubi at Kew and I remember passing by it one day when a learned young man was informing his companion that a plant had been whitewashed to kill the insects, and she remarked how ugly the process had made it. It is but another instance of how one's conception of beauty is influenced by the association of ideas. This white or glaucous coating of the stems is not uncommon among Rubi; the Himalayan R. biflorus, which previous to the introduction of this species was the best we had of this type, has been in cultivation one hundred years or more, and R. leucodermis was introduced by David Douglas, in 1829, from Western N. America. Our native Dewberry, R. caesius, has the same character to a slight extent. But none of these has the graceful habit of R. Giraldianus. The stems are biennial and the full whiteness of the bark is acquired by their first autumn; they remain white all the winter but the waxy bloom begins to wear off in the spring. The plants flower in June, the blossoms being small, purple, and of little beauty; the fruits are black and ripen early. After fruiting, these stems, being of no further use, should be cut out, leaving only the new virgin ones of the year, as seen in the picture, which will flower in their turn the following season. The fertile fruits give plenty of seeds, making the propagation of this Rubus easy. *W. J. Bean.*

NEW OR NOTEWORTHY PLANTS.

FORSYTHIA SUSPENSA var. ATROCAULIS. REHDER.

Until they were spoilt by the snow and wind of Sunday, April 27, the Forsythias were making a wonderful show at Kew, the best we have had for some years. Among them was a new variety of F. suspensa, to which the name atrocaulis has been given by Mr. Rehder. The most distinctive character of this variety is to be found in its young shoots, which are of a dark purplish hue, as indicated by Mr. Rehder's name. The flowers, too, are distinct in having the four corolla lobes noticeably broader than in the type. On some plants at Kew they are fully $\frac{3}{8}$ inch wide, and they differ also in being somewhat shorter and more rounded at the apex. The colour is not quite the same as in the old suspensa, being of a more primrose shade. On the whole this is a very pleasing addition to the Forsythias, and well worth cultivating, for these plants bloom at a time when flowers are scarce out-of-doors.

Forsythia suspensa atrocaulis was discovered by Mr. E. H. Wilson in 1907 in Western Hupeh, when collecting for Harvard University, and is no doubt in British gardens under his No. 637. I think that Wilson introduced to the Coombe Wood nursery the same or a very similar form.

The old, beautiful and popular F. suspensa has long been represented in gardens by two forms: (1) the type with very slender pendulous branches, and (2) a form of stiffer, more erect growth. The latter has been distinguished as var. Fortunei, and it represents the form to which the new atrocaulis belongs. Sir F. W. Moore informs me that this new Forsythia has been very attractive at the Botanic Gardens, Glasnevin. *W. J. B.*

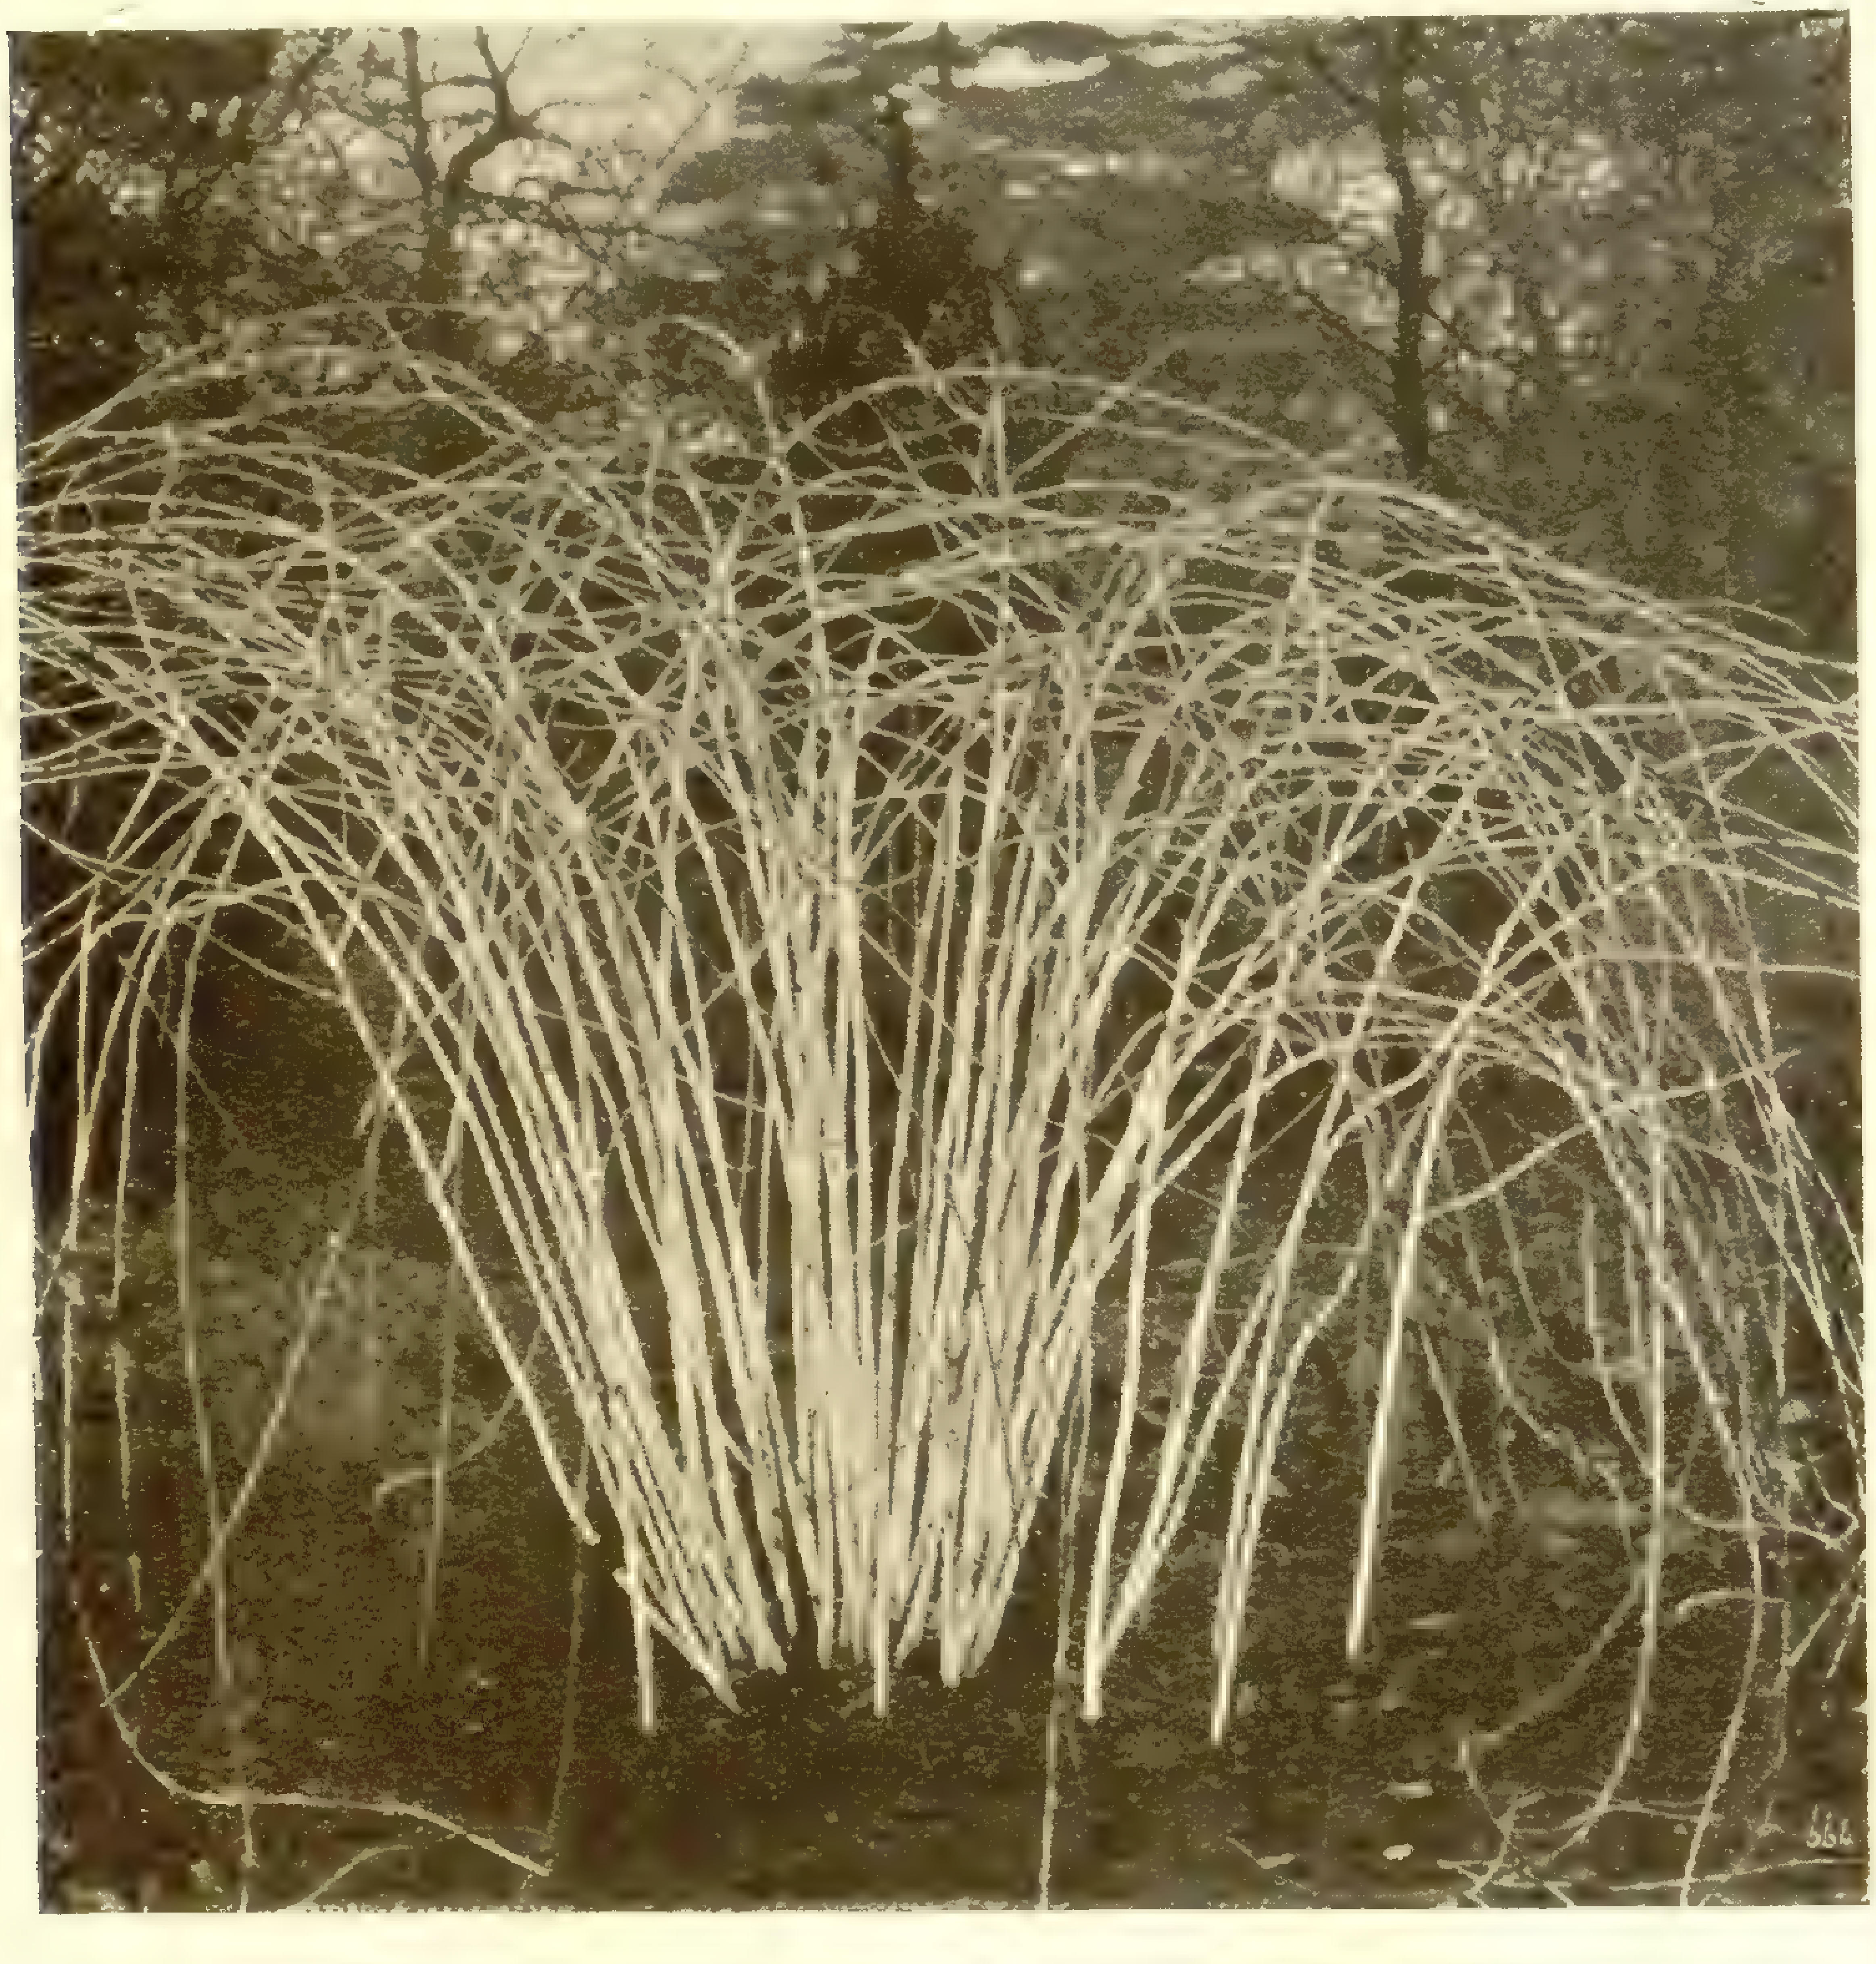

Fig. 121.—Rubus Giraldianus: a white stemmed species.

NOTICES OF BOOKS.

EDUCATIONAL GARDENING.

*Educational Gardening** is a well-written and practical book eminently suitable for teacher and scholar alike. The author does not depart from the orthodox course adopted in many treatises on the same subject. It is written in plain, simple language which beginners can understand, and contains much information necessary to successful flower, vegetable and fruit culture. The chapter on manures is helpful, but we should like to have seen the importance of the uses of lime enlarged upon; the reason why certain manures (given in the list on p. 57) should not be mixed would doubtless prove of use to both scholar and teacher. The chapter on winter handiwork is excellent, as detailed instructions and illustrations are given for making many useful garden requisites and ornaments; it would be extremely useful to children in school where carpentry and school gardening are taught to link the two subjects together and engage the children upon making labels, Potato boxes, spade-cleaners, pergolas, and garden frames.

The headings of the various chapters (if they may be so called) need revising, for under "Potash Manures" we find nitrogenous manures mentioned. Here we also see that "Sulphate of potash is purified Kainit"; such a statement is apt to prove very misleading to the scholar. The index is good, though we see no mention of sulphate of potash on p. 28 as given in the index.

THE BOOK OF THE ALLOTMENT.

When we saw the author's name we expected this little book† to be good, and it is. Though small it covers the whole field of allotment gardening, and the directions are everywhere clear, concise, and thoroughly sound. The illustrations are numerous, good, and well chosen, and there is a useful index. The appendices, relating to seasonal gardening operations, quantity of seeds needed for given areas, and insect pests and diseases and remedies, are especially useful to those for whom the book caters especially. We can thoroughly recommend this little book as one of the best we have seen on allotment gardening.

PRACTICAL GARDENING.

This book on gardening‡ is intended for American amateurs with small gardens, and it shows that some of the methods practised in that country are very primitive. The first few chapters are general ones, after which there are some twelve on vegetables, five on fruit, and a calendar at the end. Ornamental plants are not dealt with.

With regard to vegetable culture there are several plates showing crops, and one is impressed by the poor standard of cultivation. In one case a row of Onions is shown with the tops bent over to ripen the bulbs, and we read in the explanatory note that "many of the bulbs measured *two* inches in diameter." We are advised to harvest the bulbs by "pulling or raking" them out. In the chapter on Potatoes sprouting the "seed" is only recommended if an early crop is desired, and "hilling up should be practised only where the soil is stiff and the tubers are planted near the surface."

In the section on fruit, Black and Red Currants are dealt with together, and no distinction is made in the propagation, pruning, or cultivation of the two kinds.

There are plenty of illustrations, but we do not think they are well chosen. Moreover, the explanatory notes are mixed up in several cases, *e.g.*, the notes numbered 27, 29, and 73 obviously refer to Figs. 28, 30, and 74 respectively.

* *Educational Gardening*, by Robert Hogg, pp. 155. London: Messrs. A. Brown and Sons, Ltd., 5, Farringdon Avenue, E.C. Price, 3s. 6d. nett.

† *The Book of the Allotment*, by C. F. Lawrence pp. 165, figs. 53. Evans Bros., London.

‡ *Practical Gardening*, by Hugh Findlay, B.S.A., pp. 388, figs. 76. D. Appleton and Co., New York and London.

ORCHID NOTES AND GLEANINGS.

NOTES ON LYCASTE.

Among the various tropical Orchids few are more attractive than the species of Lycaste. Several years ago Mrs. Cockerell brought three forms from Guatemala, and we have had abundant opportunity to study their characters, as they flowered each season in the greenhouse. The plants were purchased in Guatemala City, but were brought from the surrounding country by the natives. The most interesting and beautiful is the one known in horticulture as Lycaste Skinneri var. alba. After comparing the living plants with typical L. Skinneri, flowering at the same time, I came to the conclusion that the so-called variety alba was a distinct species. It apparently occurs wild, and in spite of assertions to the contrary it certainly has distinct structural as well as colour characters. The lateral lobes of the lower petal or lip are much larger in Skinneri than in alba; while the bract of Skinneri is much shorter, not reaching the middle of the upper sepal. I wrote to Mr. R. A. Rolfe concerning the matter, and he discussed the question briefly in *Orchid Review*, 1915, p. 224. He did not believe that alba could be a distinct species, and I hesitated to combat his opinion, although he presented no decisive evidence. As it still seems to me at least probable that the white form should be separated, I offer a brief description from our material:

Lycaste alba sp. nov.—Scapes light green, 4.25 mm. thick; posterior bract sheathing, the sides infolding, so that the long apical part is hollow, apex tapering, sharply pointed, base 10.5 mm. wide, the back very obtusely keeled, length of bract about 72 mm., light green; anterior bract represented by a small projection about 2 mm. long, pointed with a membraneous appendage; sepals pure white, upper erect, about 75 mm. long and 36 broad, lanceolate ovate, obtusely pointed, keeled beneath apically; lateral sepals similar, faintly greenish apically beneath, about 77 mm. long and 38 broad, meeting below and slightly overlapping to form a gibbous chin; the upper sepal goes 24 mm. beyond tip of bract; petals pure white, the lower one (lip) suffused with orange at extreme base; lateral petals about 50 mm. long and 30 broad, the broad apices curled over backward; lip with a broad downwardly directed median lobe, lateral lobes hardly developed, basal part bulbous; column with anthers about 28 mm. long, very stout, the rounded apex very faintly suffused with purple; the four pollinia bright orange, on a clear white stalk; callus of lip very thick, about 7.5 mm. broad, suboval, pale orange tinted. The flowers are not sticky or aromatic.

In addition to the above and the true L. Skinneri Lindley, we have Lycaste cruenta Lindley, belonging certainly to a distinct section of the genus. The sepals are very sticky on the outer side, and the flowers have a strong aromatic odour. It is also peculiar in that one of each pair of pollinia is about a third smaller than the other. The following description of the flower is from life:

Lycaste cruenta, Lindley.—Scapes about 14 cm. long; bracts 4-5, dark red brown, sheathing, loose, pointed, uppermost about 22 mm. long; flowers erect, about 40 mm. long, brilliant orange, with the broad sepals pale yellow-green; sepals about 50 mm. long and 24 broad, oblong, rather obtusely pointed, bearded at base within; petals shorter than sepals, more ovate, with a larger apical angle, lightly speckled with crimson at base; lip abundantly spotted with crimson within, but the extended, downwardly curved median lobe not speckled, its apical margin slightly irregularly crenulate but not fimbriate; column about 16 mm. long and 7.5 broad, flattened, but thick, dark crimson at base, the contiguous part of the lip also crimson, and at the base of the lip on the outer side is a transversely elongate crimson patch. *T. D. A. Cockerell, Boulder, Colorado.*

ODONTOGLOSSUM THE TIGER.

At the meeting of the Orchid Committee of the Royal Horticultural Society of April 29 last, H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), received an Award of Merit for Odontoglossum The Tiger (see Fig. 122), a hybrid between O. Lawrenceanum (Rolfeae × triumphans) and O. Stella (sceptum × triumphans). The cross is especially interesting in that it suggests a means of vastly improving a dominating species florally by indirect means. The principal species indicated is O. triumphans, and the hybrid retains its features, but progresses beyond the famous O. triumphans Lionel Crawshay in a remarkable degree. The O. Harryanum in O. Rolfeae is to be traced, but the O. Pescatorei in that hybrid is not in evidence. The colour of O. sceptum harmonises with that of O. triumphans. The ground colour is yellow, the markings red-brown, a few purplish lines appearing at the base of the lip.

NEW HYBRIDS.

(Continued from March 22, p. 136.)

Hybrid.	Parentage.	Exhibitor.
Brasso-Cattleya Cowanii	Thorntonii × Madame Ch. Maron	P. Smith, Esq.
Brasso-Cattleya Fair Rosamond	B.-C. Digbyano-Schröderae × C. Mossiae	Duke of Marlborough.

Conifers dead—probably killed by cold in winters 1916 1917 and 1917-1918. 23° of frost February 3, 1917, 21° on December 19 and 20, 1917, and 21° on January 9, 1918:

Phyllocladus trichomanoides.
Juniperus monosperma.
Dacrydium cupressinum
Podocarpus dacrydioides.
—— ferruginea.
—— latifolia.
Callitris cupressoides.
—— robusta (lived ten years).
Picea obovata.
Abies religiosa.
Pinus Montezumae; type
—— longifolia.
—— oocarpa.
—— Pringlei.
—— rigida var. serotina
Widdringtonia Whytei

Conifers killed or much injured in one part of the grounds, but alive in other parts:—

Juniperus californica.
—— procera.
—— pachyphloea.
Podocarpus acutifolia.
Pinus leiophylla.
—— halepensis.
—— patula.
—— pseudo-Strobus.
—— Teocote
—— torreyana.
Libocedrus microlepis.

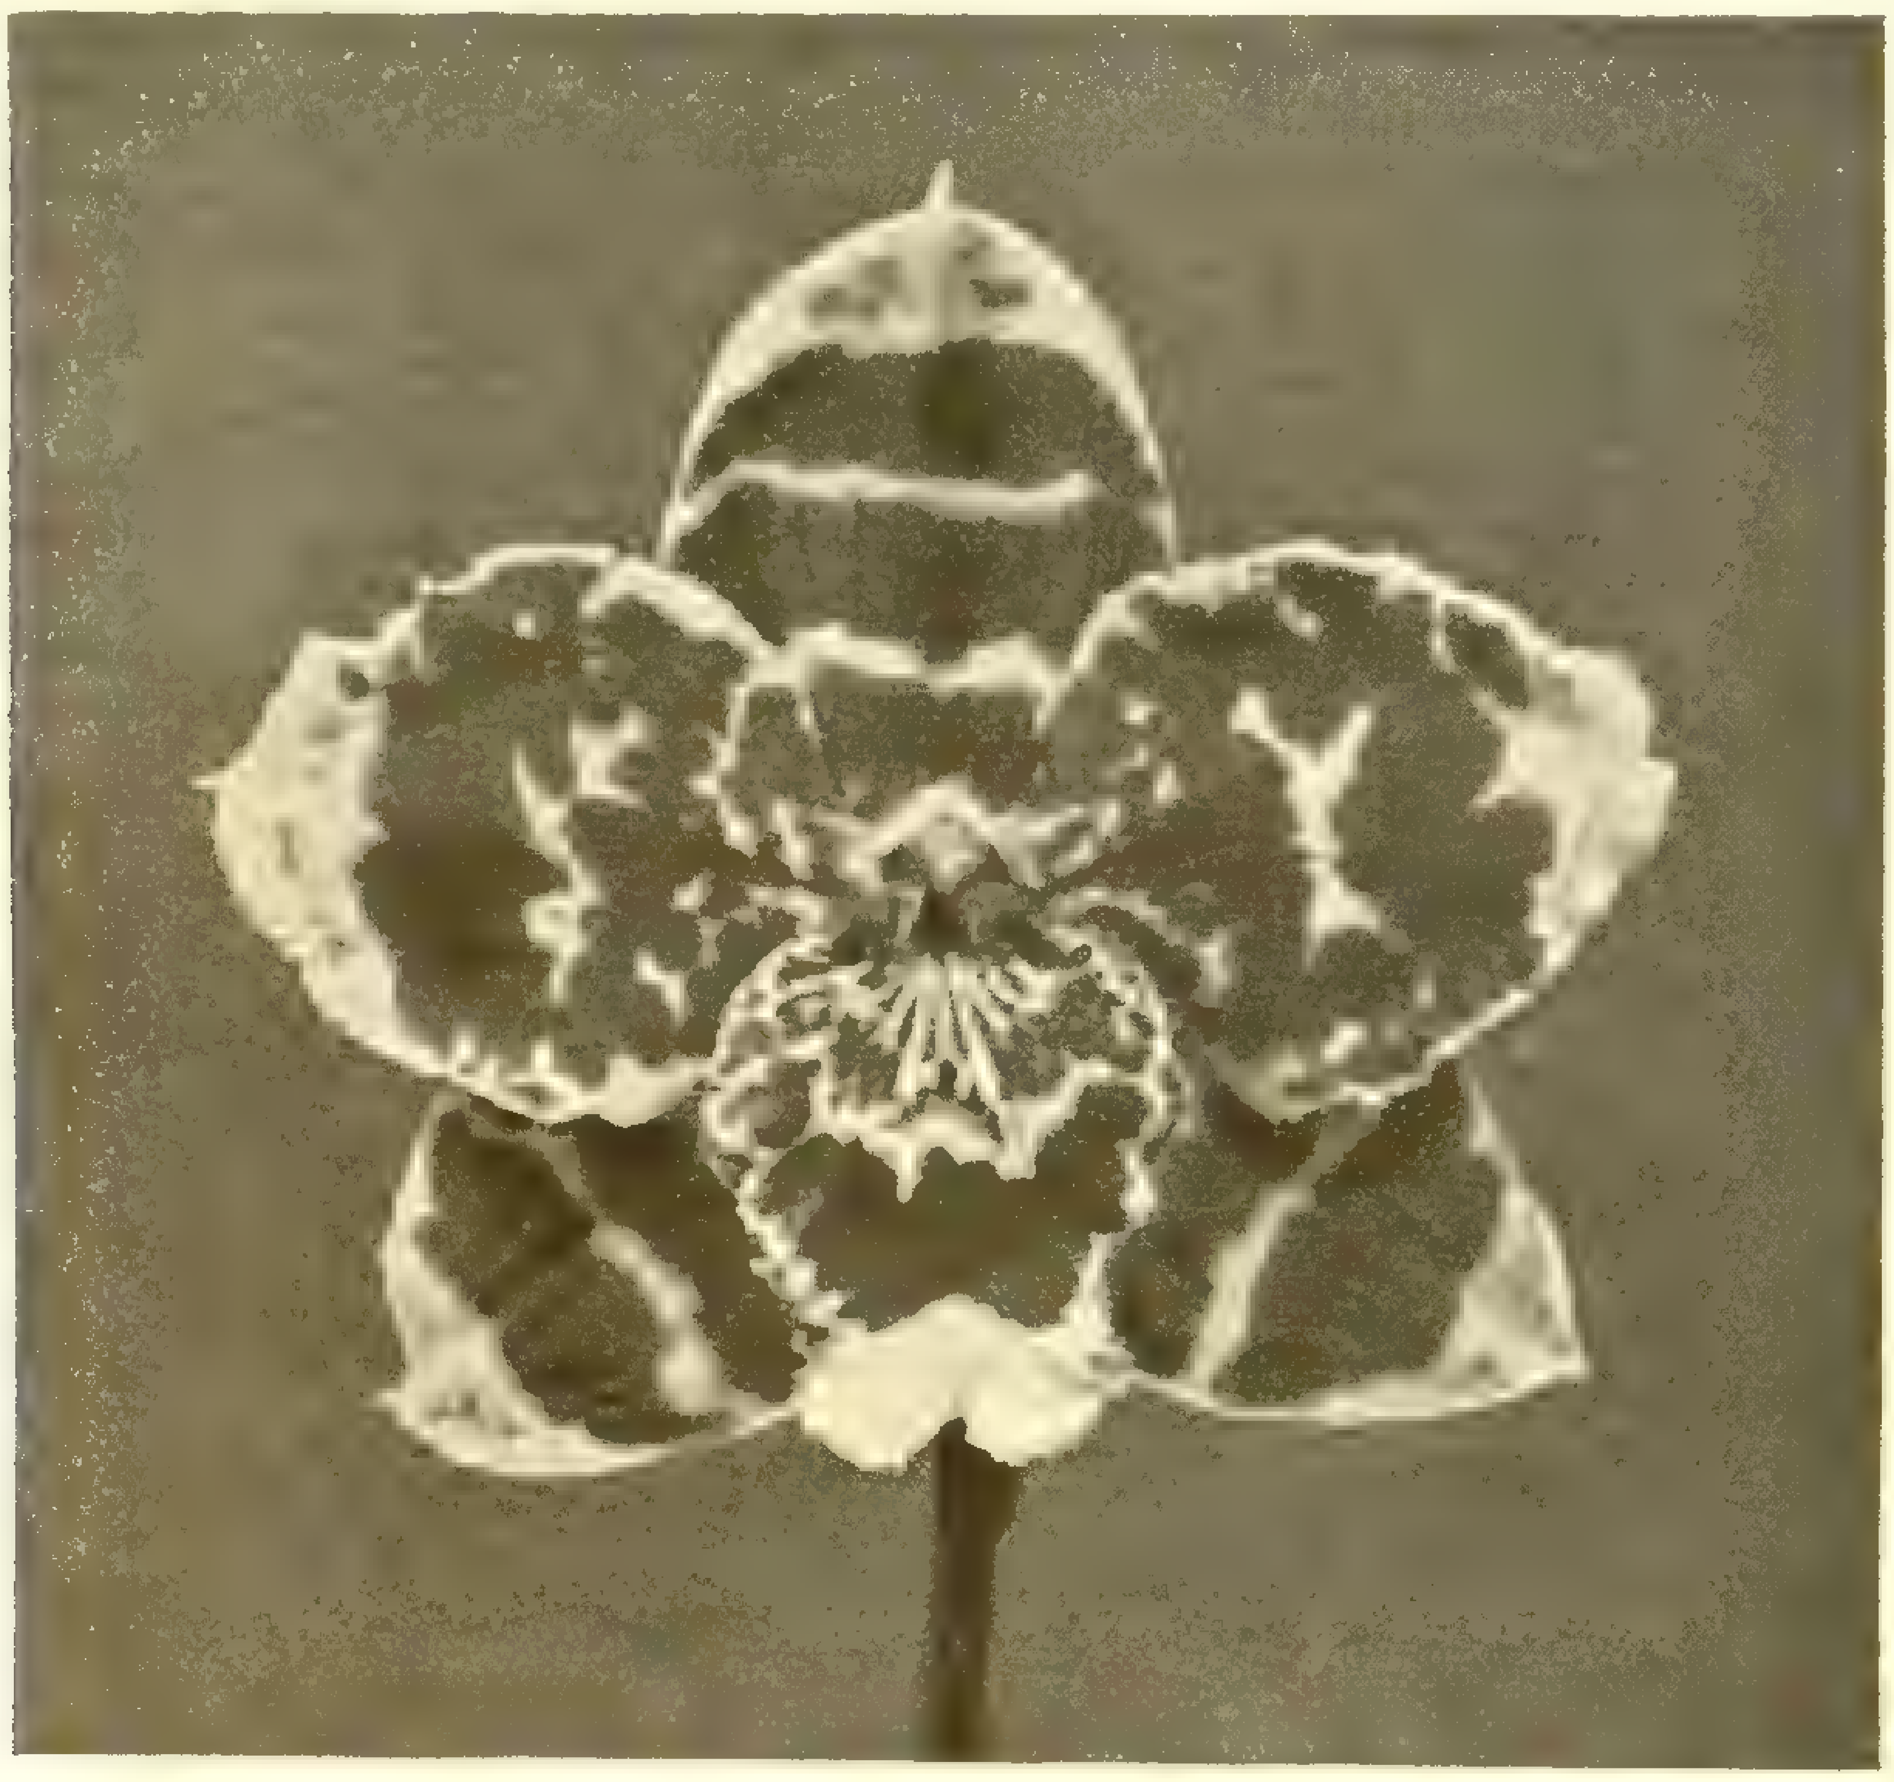

FIG. 122.—ODONTOGLOSSUM THE TIGER: REDDISH-BROWN MARKINGS ON YELLOW GROUND.
(See page 249.)

The following are doing well here, although they have a bad mark against them in Veitch's Manual, being mentioned as either too tender or otherwise unsuitable to ordinary English climate:—

Juniperus bermudiana.
—— Oxycedrus.
—— Cedrus.
Pinus Ayacahuite. This seems quite hardy, but P. Buonapartea is tender and has been killed. These two are often confused—Shaw does not separate them.
Pinus palustris grows slowly.
Pinus Montezumae var. rudis and var. Hartwegi seem hardy, but the type is tender and has been killed.
Pinus resinosa.
Pinus Taeda
Tsuga brunoniana.
Abies webbiana and Abies sachalinensis have not been cut with spring frosts.
Abies Mariesii.
Abies balsamea.
Athrotaxis cupressoides.
—— laxifolia.
—— selaginoides.
Libocedrus tetragona seems hardy, but grows slowly.
Fitzroya patagonica.
Saxegothaea conspicua.

The following were planted before the big frost of 1895, when the thermometer fell to 4°:

Abies concolor lasiocarpa	Griffithii.
—— lowiana.	Libocedrus decurrens.
—— nobilis	Picea excelsa.
—— magnifica.	—— Morinda
—— nordmanniana.	—— nigra.
—— Pinsapo.	—— orientalis.
Araucaria imbricata.	—— spinulosa (morindoides.
Cedrus atlantica.	Pinus Cembra.
—— Deodara.	—— excelsa.
—— Libani.	—— Laricio.
Cryptomeria japonica.	—— —— austriaca.
—— —— elegans.	—— montana.
Cupressus lawsoniana.	—— Pinaster.
—— nookatensis.	—— sylvestris.
—— thyoides.	Pseudo-tsuga Douglasi.
—— torulosa.	Sequoia gigantea.
Juniperus chinensis.	—— sempervirens.
—— excelsa.	Taxodium distichum.
—— occidentalis.	—— —— pendulum.
—— Sabina.	Taxus baccata.
—— —— prostrata.	—— —— adpressa.
—— virginiana.	Thuja dolabrata.
—— wallichiana.	—— plicata (Lobbi).
Pseudo-larix Fortunei.	—— occidentalis.
Larix americana.	—— orientalis.
—— europaea	Tsuga canadensis.
	—— pattoniana.

Where the specific name of a plant is the name of a person and ends in a consonant (except when it ends in "er"), those who wish to conform strictly to the principles of nomenclature adopted by the Vienna Conference may write the termination "ii" instead of a single "i," as

Picea Maximowiczii,

and they may also substitute

Larix decidua for Larix europæa

as the scientific designation of the common European Larch.
Edmund Giles Loder, Leonardslee, Horsham, Sussex.

NOTES FROM IRELAND.

THE spring show of the Royal Horticultural Society of Ireland, fixed for April 10, had, perforce, from unforeseen circumstances, to be abandoned at the last moment. It is proposed to hold a show in conjunction with the Royal Dublin Society's agricultural function at Ballsbridge, Dublin, in June.

Tuesday, April 22, which found Daffodils in the mature flush of their vernal beauty, was ushered in by six degrees of frost at the Royal Botanic Gardens, Glasnevin, and the many thousands of these bulbous flowers were spoiled. The rock garden at Glasnevin is now very beautiful and interesting with early alpines, most notable, perhaps, being such exquisite little alpine Primulas as P. ciliata superba, P. ciliata purpurea, P. marginata, P. pubescens alba, and the miniature, almost microscopic, P. Giraldiana. Tulipa Fosteriana gave a patch of vivid, intense colour. The softer-hued Primula rosea is planted in masses at a distance from the Tulip, so that their colours did not clash.

Primula rosea, in little colonies fringing the pool, an intake from the Tolka, which does so much for the Glasnevin grounds on the lower level, flashing its rose-carmine back from the water in which it is mirrored, brooks no rival. There it reigns for a season, supreme, superb, alone. A little later the spacious, informal bog bed on the south side of the pool will be the cynosure of all interested eyes.

Vegetation in the Dublin district is backward, although Pears and Plums are bedecked with blossom, the outcome of which is, to say the least, doubtful. The veteran Jargonelle Pear tree, planted in 1815 by Sir Phillip Crampton on the front of the house, 14, Merrion Square, is blooming bravely. This famous Pear tree has had a distinguished career, and Dr. John Hamilton, residing at 14, Merrion Square, in 1873 wrote that 1,700 Pears were gathered from it that year, while two years earlier the estimated crop was over 4,000 fruits. The roots of the old tree are buried down in the basement, and the secret of the tree's fertility seems to have lain in an ancient sewer into which the roots had penetrated, and were found by Dr. Hamilton in masses resembling "bundles of birch-broom." *K. Dublin.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Mites on Red Currants.—In certain buds of Red Currants grown at Long Ashton, I have found in some numbers of mites having a great resemblance to those of Eriophyes ribis, the mite that causes Big Bud in Black Currants. There is some reason to think that E. ribis may be much more common on Red Currants than is generally supposed, and I am therefore venturing to appeal to your many readers for material. Big Buds are not caused, as in the case of the Black Currant, but attacked buds generally fail to shoot in the spring. All buds of any size, therefore, that are at the present time dormant, are suspect, and I should be greatly indebted if any of your readers would send me any such apparently dead buds from the Red Currant. The most likely place to find such buds is at the base of the last year's wood growth. *A. H. Lees, Agricultural and Horticultural Research Station, Long Ashton, Bristol.*

Variability in Plants.—I recently sowed some Fuchsia seed, which I had saved last year. The bulk of the seedlings have normally the opposite leaves of dicotyledonous plants. But one was tricotyledonous, and is regularly developing whorls of leaves in threes. Can any reader inform me if this is a common occurrence? I can find nothing to correspond with it in examination of a fair collection of Fuchsias to which I have access. I can only discover that in botanical articles the Fuchsia is described as having "usually opposite leaves." If it is abnormal, how will it affect the question of botanical classification? If the Fuchsia is classed as a dicotyledonous plant, where will a tricotyledonous Fuchsia come in? What is its bearing upon problems of biological variation? Here is a variation that seems to go back behind the rank of species, behind the rank of orders, and to take its rise in the very primitive and initial constitution of plant life. I have a tricotyledonous Fuchsia seedling. Apart from its exhibition value, what is, if any, the biological import of it? *E. Judson Page, A.R.C.Sc., Inter B.Sc. (Lond.), Exeter.*

Gardeners' Hours and Wages (see page 230).—*W. M. G.*, like many other writers on the subject, fails to advise how any rate of hours and wages can be enforced. He also fails to appreciate what is being done in that direction. As he states, with matters as they are, "no one can," thereby excusing himself. But is it right that he should practically condemn the B.G.A. in its effort to make such a thing possible while he offers no solution to the problem? He, like previous writers, agrees that unity is necessary, and at the same time turns his back on the Association, which is doing most in that direction. The secretary realises he cannot enforce the adopted standard of hours and wages with the membership of the Association so few. What he desires is to place the principle of the B.G.A. before gardeners generally. Young men, gardeners in pre-war days, on demobilisation naturally require some guide to conditions with regard to hours and wages prevailing at the moment. With their assistance in joining the Association, things might be enforced. I believe if every gardener who knows of the B.G.A. were to join the same it would then be sufficiently strong for action. *W. M. G.* declares "It is not right to ask gardeners to subscribe to the funds" until enforcement of the adopted standard is possible. He is surely short-sighted or narrow-minded; someone must build before any can find shelter: is he to stand by until the building is over? Were every gardener a member of the B.G.A. the surplus in the profession would still remain. A vacancy might have its hundreds of applicants, but none would plead for the situation at such a wage as 30s. All would ask the same standard wage, and the best man should win. Again, if the head were a B.G.A. man and wished a foreman at 40s. he would not be faced with the fact that he himself had only 38s. He would have the standard wage for a man in his position. *W. M. G.* asks, "If all come out for better pay, will the B.G.A. house and keep them?" yet he declines indirectly to subscribe to the funds to assist in doing so. In closing he admits unison is essential before higher wages can be demanded. He then casts his eyes heavenward and talks of a better future, whereas he should put his hand in his pocket and assist the funds of the Assocation which is making an endeavour in the right direction. He prefers to be a procrastinator rather than a subscriber. —*J. G. J.*

—— Two lads in the garden in which we are employed asked for more wages, yet they could not get more than 21s. per week without bothy accommodation. They secured employment at the railway works for 32s. a week and 10 hours less work. One of the labourers became dissatisfied and has gone to work on a farm for 10s. a week more wages and a house in addition. In our opinion, the cause of discontentment amongst gardeners is that the head will engage anyone whether he possesses a knowledge of gardening or not, and pay an unskilled man the same wage as a skilled man. *Four Journeymen.*

Cool Treatment of Vines. Many gardeners have been unable to give their vines the temperatures usually considered necessary in Grape culture. Here we have a large, span roofed house 100 ft. by 18 ft., in which vines of Muscat of Alexandria, Black Hamburgh, Black Alicante, Gros Colmar, Mrs. Pince and Gros Maroc were planted last December, and since then fire heat has not been employed save for the purpose of testing the boiler and pipes. The vines were bought last winter previous, and the house not being ready, they were cut back and planted out in a splendid yellow, loamy soil. The canes broke strong and grew 10 ft. long. They were very short jointed, and ripened splendidly, being in the open until lifted for transplanting in a new house in a thoroughly made border. Some of the vines were cut back to three, four and five feet. They have broken strong, and are showing plenty of fruit. I shall watch narrowly how they set fruit and how the berries finish. I shall only allow an average of two bunches on each vine. I am writing in the hope that some Grape grower will give me his experience regarding the behaviour of his vines grown in a low temperature. *J. W. Irvin, Bradley Gardens, Grimsby.*

The Week's Work.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Marrows.—During the coming week it should, generally, be safe to set Marrows in the open provided the plants have been suitably hardened. Some of the seedlings may be planted on raised beds made of leaves, stable litter, grass mowings, and the turfy edgings from grass paths. These materials will form a suitable rooting medium if well mixed. Place on the top of the heap hillocks of soil consisting of loam, leaf-mould, and burnt earth, and plant the Marrows therein at 3 feet apart. The other plants may be set in trenches prepared as for Celery, but partly filled with decayed manure, covered with 6 inches of soil. Plant at 1 yard apart. Pumpkins require similar treatment.

Tomatos.—Plants raised early in March for outdoor culture should be ready for their final quarters, if they have been exposed during the day during favourable weather, by removing the frame lights entirely. If there is doubt as to the plants being perfectly hardy, defer their planting for a few days. Outdoor Tomatos do best when they are planted against walls or fences facing south. A hard base is best for the roots, and the soil should be well rammed and over it should be placed heaps of chopped loam mixed with a little burnt earth. By adopting this plan the plants will not make rank growth, which militates against the "setting" of the blooms. Plant firmly, at 18 inches apart. Water the roots and place the stakes for support. Add light top-dressings of similar soil as the roots appear on the surface, and use manures when plenty of fruits have formed. Stop the plants early in August, and keep the side shoots pinched out as soon as they develop.

Capsicums.—These plants should now be potted in good fibrous loam, with some spent Mushroom-bed manure and a little mortar rubble added. Place the plants near the roof glass in a warm house or pit, and maintain a moist atmosphere by the free use of the syringe.

Peas.—Make frequent sowings of Peas to maintain a constant supply of pods. Plant in well prepared ground, and, when the sowings are completed, leave the surface 2 inches below the surrounding level, to allow for mulching and watering. Sow, in addition to the maincrop sorts, a late variety, such as Autocrat or Masterpiece.

Broad Beans.—Where late Beans are appreciated, a final sowing of this vegetable may be made in an open position, choosing the smaller, green-seeded varieties.

CHELSEA SHOW.

FIG. 124.—IRIS TURKOMAN, EXHIBITED BY MR. W. R. DYKES.

(See awards by the Floral Committee, p. 258.)

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD Wrotham Park, Barnet, Hertfordshire.

Rock Garden.—Any plants of an aggressive character should be restrained before they encroach upon the choice and weaker growing subjects. The latter should have the soil about their roots pricked up carefully and be given a light top dressing of suitable soil. Remove weeds and any rubbish which may have accumulated, and leave the whole neat and tidy.

Ferns.—Hardy ferns will now be growing apace. Remove old and decayed fronds and apply a top dressing of peaty compost containing plenty of grit. Little further attention will be needed beyond a good supply of water should a long spell of very dry weather set in.

Climbers.—The thinning and training of the growths of all kinds of climbers should not be neglected. The work should be carried out early to prevent the entanglement of young growths.

Herbaceous Borders.—These are now becoming gay, and the plants should be given every attention. Some will need to be staked and tied, and all should be kept free from weeds. Many kinds of plants may now be planted in borders to take the place of early-flowering subjects.

Spring Flowers.—Before these have finished their flowering season, make notes of the most useful subjects for another year's planting, as this will prove very useful and obviate much trouble later.

May Flowering Tulips.—These should always be extensively employed for spring displays. There is a wide choice of excellent varieties that will produce fine colour displays, either separately in beds or grouped in borders.

Begonias.—Begonias which were planted in cold frames should now be growing freely. Do not allow the plants to suffer from lack of moisture at the roots. During brilliant sunshine slightly shade them for a few hours daily and spray them overhead each afternoon with tepid water. Beds should be deeply dug and well enriched with thoroughly rotted manure for the reception of Begonias. Good soil and a few applications of liquid manure during the summer will suit these plants admirably.

Annuals.—These will be growing freely and need timely attention in the matter of thinning the seedlings. Never allow crowding, but thin the plants very carefully, preferably in showery weather, as the flowers will be larger and the season of beauty considerably lengthened as a result. Sowings of several kinds may be made now to provide a display later on.

Mignonette.—Thin out the seedlings of the large-flowering varieties of Mignonette. Should the weather prove dry, scatter a little soil and wood ash along the rows and give the whole a good watering; in fact, similar treatment is needed by all annuals immediately they are thinned, if the weather is hot and dry.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Orchard House.—The fruits of Apples, Pears and Plums in orchard houses will be sufficiently advanced for thinning, and trees which flowered freely and set heavy crops should receive early attention. With the exception of extension growths, pinching is best done at the earliest opportunity, that is, when the young shoots have made five or six leaves. By pinching out the points of the more forward shoots as they develop, the trees will receive no check. Where many young growths are clustered thickly together, disbudding will be necessary. If a hose-pipe is available, give the trees a thorough washing with clear water during the afternoons whenever the weather is favourable. A cool, damp atmosphere at night is congenial to the trees and assists them to swell their fruits. Aphis must be kept in check, either by spraying with an insecticide or by fumigating. Caterpillars should be destroyed by hand-picking. Admit fresh air freely on mild, sunny days.

leaving the top ventilators open a little during the night.

Trees in pots.—If the pots are filled with roots, top dress the latter with rich, turfy loam, adding manure from a spent Mushroom bed and wood ash. An increased amount of water and stimulants will be required as growth progresses. In the case of trees planted out, the borders should be well mulched with half-rotted cow manure.

Melons.—Fruits on the earliest Melon plants should be ripening. The fruits of certain varieties of Melons separate from the stem much more readily than others, and these should be cut on the first signs of separation. Healthy root action should be encouraged up to the time the fruits are ready to cut. Damping the house should be discontinued, as it is desirable to maintain a warm, dry atmosphere to develop the best flavour in Melons. Afford sufficient water to the roots to keep the soil moist.

Later Melons.—Successional Melon plants are making rapid growth and the fruits will be swelling freely. When they attain the size of a cricket-ball some support is necessary, special Melon nets being best for the purpose, although a square piece of board suspended by string is commonly employed. To prevent the fruits decaying, the board should have a hole about one inch in diameter in the middle, or it may be slightly inclined to one side, in order that moisture may not remain on it. Add a small quantity of fresh compost to the ridge when the roots grow through the surface. A mulch of manure from a spent Mushroom bed or well-rotted cow manure will be beneficial to the plants and considerably lessen the amount of water required by the roots. If large fruits are desired, feeding with liquid and artificial manures must be resorted to, but care must be exercised in regard to the quantity applied. Keep the plants free from aphis by vapourising on the first signs of this pest. Damp the bare spaces of the house on frequent occasions when the weather is favourable, closing the house early in the afternoon with plenty of atmospheric moisture. Plants in flower and others approaching that stage need immediate attention in respect of the pollination of the female blooms. Regulate the growth by pinching, in order to obtain the required number of female blooms to open at the same time. More seed should be sown for raising successional plants as circumstances require. From seed sown now the plants should yield ripe fruits in fourteen weeks in normal conditions.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Sophronitis grandiflora.—Some plants of this species have been late in flowering this season, and quite recently a few specimens were in flower here. The blossoms are among the brightest and showiest provided by Orchids, and they light up the houses during the dull days. It is a mistake to leave the blooms on the plants too long, especially on weak specimens, the tiny pseudo-bulbs not being strong enough to stand the strain. If re-potting is necessary, it is best done soon after flowering, as new roots are then formed by the partially developed growths. A compost similar to that previously advised for Cattleyas, used in rather a finer state, will suffice, putting plenty of drainage beneath it and fixing the roots firmly in the material. Sophronitis are best grown in small pans hung close to the roof glass in a cool house where the atmosphere is not liable to fluctuations, where the light is good in winter, and where they may be carefully shaded in summer.

The Cattleya House.—This house is very interesting now, as many species and hybrids of Cattleya are in flower, and others are just beginning to grow. Many plants will have been repotted, and in some instances the roots have already made considerable progress. Established plants now need a fair supply of moisture, but not quite so much as will be necessary a little later, when root and stem growth are more active. Watchfulness is essential, especially for plants growing close to the light; never allow them to remain dry for long, but always let the rooting material be somewhat dry before water is supplied. The weather is usually fickle at this season of the year, and judicious shading is very necessary. Lower the blinds before the foliage gets hot. Strict attention should be paid to ventilation; the earlier the ventilators are opened the longer may shading be delayed, as the current of air playing over the foliage keeps it cool. The amount of damping down must be governed by the weather, the bright sun and drying winds at this time of year soon drying up the moisture from floors and stages. Where the cleaning of Cattleyas was neglected during winter, the effect will now be apparent, for with the increasing temperature insects of all kinds, especially thrip and scale, will become very active and increase at an alarming rate. The plants cannot grow properly unless these pests are destroyed, as they cripple the best and strongest of growths. On the first appearance of thrip the house should be fumigated by means of one of the vaporising compounds; dipping the plants in some safe insecticide is also an excellent method of eradicating this pest. For scale, sponge the plants, afterwards fumigating or dipping them. For a few days following either operation the plants need more shading than usual, or the tender young growths may be damaged.

Potting.—The growing season of most of the spring-flowering Cattleyas, Laelio-Cattleyas and Brasso-Cattleyas commences soon after the blooms are over, and if any of the plants require repotting they should receive attention as they go out of bloom. While no harm comes to these epiphytes from allowing a few roots to ramble over the outside of the pots, it must not be forgotten that the compost is the proper place for them, and if the "leads" grow out over the rims of the receptacles the plants are weakened. When potting, the best class of material only should be used, and the roots disturbed as little as possible. Vigorous seedlings are now more or less active, and the majority of them make roots freely and soon become root bound. The repotting of any that need it should be carried out now. Seedlings approaching flowering size should be placed where they can receive the maximum amount of light, but the younger plants make better progress if they are staged by themselves where they can be afforded a little extra shade, and a moister atmosphere than the rest.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Nut Weevil.—This insect is often allowed to increase through neglect, but if the trees are kept clean and, where possible, syringed with an insecticide, it may be kept in check. The female insect generally lays her eggs in the young nuts, in most localities in May, and crawls along the shoots to do this. A good dressing of soot and lime applied to the soil before the female climbs the tree acts as a deterrent. After the eggs are laid they hatch out in about a fortnight and the grubs feed on the young nut, but they do not destroy its vitality until they are fully grown. The grub eats its way out of the nut at the end of the season. The most effective cure is to shake the trees well in August, when the infected nuts will drop. They should be gathered and burnt. If this precaution is carried out each season the trees will soon be rid of the insects.

Mulching Cherries.—Cherry trees showing signs of carrying good crops should have another thin mulch of manure over the roots and the soil afterwards well watered. It is best to apply thin mulchings and add fresh material if required, according to the crop. A tree carrying a light crop will not need heavy surface dressings of dung, provided it is in good health, for much feeding would cause it to make gross growth.

Pests of the Cherry.—The larva of the small Ermine Moth will now begin to show itself, and also various other Caterpillars. Prevention is better than cure, and I find that spraying with Quassia extract before the trees come into bloom is a good preventive of the pest and also destroys green and black Aphides. The latter is very destructive to Cherries if allowed to spread. Paris green used at the rate of 1 oz. to 15 gallons of water will kill the insects, but should not be used when the trees are in bloom. Where the pests are troublesome the trees should be sprayed before the leaf buds develop and again after the trees have blossomed, but should not be used after the fruits have commenced to swell.

Removing Surplus Shoots on the Morello Cherry.—This work should be done as soon as the shoots can be pinched by the finger and thumb. Retain the growths that are best situated for training, and rub off those on the side next the wall, also those growing at right angles from the wall. Leave only sufficient growths to fill the space without crowding. It is sometimes necessary, in order to fill vacant spaces, to stop some of the shoots, and this should be done before they have made much growth. Stop them at two joints behind the point required to be filled. In pinching and stopping some growth must, in all cases, be left beyond the fruit, or on a level with it, otherwise the fruit will not swell.

Raspberries.—Plantations of Raspberries should receive attention. Thin the suckers, removing all the weaker shoots, and leaving only sufficient new canes to fill the space allotted without crowding. Generally about six shoots to each plant are sufficient. After thinning the suckers, if the weather is hot and dry, use the grass mowings as a top-dressing to retain the moisture in the soil.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Richardia africana.—Plants of Arums now past their flowering stage and hardened off in a cold frame should be prepared for re-potting or planting out. In the latter case make a trench such as for Celery, dig in some cow manure if the soil is poor, and allow plenty of room and give the roots abundance of water as well as liquid manure. Plants to be potted may either be divided to increase the stock or shifted into pots of a larger size, and potted in a mixture of good loam, leaf-mould, dried cow manure, some wood ash and bone meal. Plants in pots require an abundance of water at the roots in summer.

Lilium.—Lilies in all conditions do best under cool treatment. The more forward plants that are showing their flower buds should be placed in a cool house, and given a support to each shoot. Provided sufficient space has been left in the pot, a top dressing of rich compost may be given; in addition the roots require frequent applications of liquid manure. Guard against aphis infesting the point of the shoots. Late summer and autumn flowering kinds, such as L. auratum, L. speciosum album, L. s. rubrum, and L. candidum, will do best for the present in their pots out-of-doors in a partially shaded situation on a base of coal ashes. As the plants develop and the flower buds appear, give the roots manure water on frequent occasions.

Cyclamen.—Plants of Cyclamen raised from seed sown last autumn and now growing in 3-inch pots may be shifted into 4½ or 5-inch pots. Use a rich compost consisting of loam, leaf-mould, sand and sifted cow manure. In potting, keep the corm at the surface of the soil, and do not make the soil very firm. The plants should be grown in a warm frame close to the glass, on an ash base that retains moisture, thus keeping the roots moist. Syringe the foliage daily until fresh roots are formed. Keep the frame close and shaded from bright sunshine. As the season advances syringe at a later hour, closing the frame for an hour and ventilating fully again in the evenings. Cyclamens are most successfully grown in a low-roofed house by themselves, where the necessary conditions of moisture can be provided.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 56.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, May 21, 10 a.m.: Bar., 30.1 temp., 49°. Weather—Bright sunshine.

Hampton Court Gardens. Agitation for the restoration of the flower beds at Hampton Court is again in evidence and with increased force. Our views with regard to certain alterations which the Office of Works were supposed to have decided to make were given in the issue for March 1, p. 98, and we see no reason for modifying them. There must be flower beds at Hampton Court; without them the gardens would be deprived of one of their chief attractions for the public. But we know on the best authority that it is not the intention of the Office of Works to do away with them. This is borne out by a plan of the proposed alterations which was published in *The Times* last Tuesday. According to this there were, before the war, 53 flower beds in a double row adjoining the Broad Walk and 61 in the semi-circle in front of the Palace. Owing to the war, many of these beds were turfed over, and now that there is no need for the economy which led to this reduction the intention is to re-arrange the scheme of beds on more appropriate lines. In our opinion, this course is a right one, provided that there is to be no serious reduction in the floral display. The old beds were not all well placed. For example, those under the Yew trees were not only wrong with respect to landscape art, they were also unfavourably situated with regard to the health of the bedding plants with which they were furnished. The plan published in *The Times* is convincing on this point. There were too many beds, and they produced a crowded effect which, although not objectionable perhaps to the majority of visitors, was offensive to experts. Public criticisms are not always fair, nor are they trustworthy guides to proper action. We are satisfied that so far as the flower beds are concerned the proposed alterations are such as would meet with expert approval. The proposal to widen the borders along the Palace walls at the expense of the noble Broad Walk requires careful consideration. To reduce the width of the walk by 5 ft. might not be an improvement, although it would no doubt add to the value of the border, which is narrow for its length. This border might be made effective without filling it with plants too tender to be grown in a border outside, really greenhouse or even stove plants, showy enough no doubt, but certainly not suitable for the purpose. There is available a wealth of hardy herbaceous plants, both perennial and annual, and these, if properly selected and arranged, are capable of producing a charming effect for the greater part of the year. Such plants as these should be used to furnish this border. *The Times* is incorrectly informed when it states that herbaceous border plants are effective only in the autumn; on this point every experienced gardener knows better. The proposal to petition the King to forbid improvements at Hampton Court is ridiculous. Gardening is a progressive art, otherwise these flower beds would never have been formed at Hampton Court, as we believe they have all been added within the last 50 years or so. To be logical, those who object to alterations there should insist on the gardens being restored to their form in the days of Charles II., or even to that which gave enjoyment to Henry VIII. and his Court.

Appointment.—Mr. I. Dowding, Assistant Horticultural Lecturer to the Staffordshire Education Committee, has been appointed Chief Organiser and Instructor in Horticulture to the Cumberland and Westmoreland Joint Agricultural Committee. Previous to his appointment under the Staffordshire Education Committee Mr. Dowding was gardener to the Rt. Hon. Lord Stafford, at Swynnerton Park.

Gardeners' Royal Benevolent Institution.—In response to our appeal on behalf of the funds of the Royal Gardeners' Benevolent Institution (see p. 250), we gratefully acknowledge the receipt of four guineas from the staff of Messrs. Samuel Finney and Co., Ltd., 18 and 20, Grainger Street, Newcastle-on-Tyne.

A Public Protest.—A meeting of local authorities, held at Teddington on the 16th inst., decided to send to the Government an emphatic protest against "any further spoliation of the flower beds at Hampton Court Gardens," and a demand that the beds already turfed should be restored. Sir A. Mond is to be asked to receive a deputation, and if the interview is unsatisfactory, a request is to be made to the King to receive a public petition.

Fruit Prospects in Devon.—A correspondent informs us that fruit growers in the Topsham and Exmouth districts of Devonshire are looking forward to a good fruit year. Of the earlier bush fruits, Gooseberries give evidence of a good average crop, though there are some indications of withering on a slight scale in some parts of the area. Currant bushes of all kinds are looking fairly healthy, and so far as can be judged from the blossom there is every sign of a good crop. Strawberries and Raspberries give promise of normal yields. Plums, Pears and Apples, the outstanding failures of last season, have now every appearance of being in plentiful supply this year, whilst a good harvest of Plums is almost a certainty. Growers and gardeners, whilst admitting the advantage of a late season, as is the case this year, attribute the good prospects to the universal adoption throughout the area of a thorough system of spraying in the winter and early spring.

Restoring the Gardens of Our Allies.—In response to a very urgent appeal from the British Committee of the French Red Cross a special consignment of vegetable and garden seeds has been sent by the War Relief Fund of the Royal Horticultural Society, whilst thousands of fruit trees are to be sent in the autumn. Many thousand spades and garden tools and large quantities of seeds have also been recently sent to Roumania.

Child's Death Attributed to Eating Primroses.—The three-year-old boy of a farmer in Half Morton, Dumfriesshire, has died from what the local doctor considers gastritis caused by an irritant poison. The boy had been eating Primrose flowers, and it is thought that those were the cause of the illness which ended in his death. Botanical and other works dealing with the medicinal and other virtues of the Primrose are silent on the question of the flowers being poisonous, and, of course, they were and are still employed for making wine, and have also been used in syrup.

Pentstemon Palmeri.—This species, native of the western and southern slopes of the San Francisco Mountains of Arizona, is described in *Plant Immigrants*, No. 152, Dec. 1918, as a desirable acqusition. P. Palmeri bears spikes 4 to 6 ft. high and as grown in California, may throw up flower spikes of 7 feet and bearing for a length of 2 or 3 feet large, pink flowers.

Capsid Bugs in Apple Trees.—Though the capsid bug has only in recent years done any considerable damage to Apple orchards in this country, and has not yet appeared in every fruit-growing district, it is a serious pest; and all growers should be on the watch for it in order to take timely measures to control it. There are several species of these bugs; but the only one that concerns the fruit grower is the Green Apple capsid (Plesiocoris rugicollis). It is almost always to be found on Willows, and probably has only transferred its attention lately to the Apple. The first signs of attack are given by the appearance, early in the season, of small brown spots on the young leaves; each spot marking a puncture made by the bug in order to reach the juices on which it feeds. As the leaves grow the parts round each puncture die and fall out. Later the tender shoots are attacked, and also the fruit. Many of the young Apples drop before they reach maturity, while a large proportion of what are left are deformed and rendered unfit for market. The best time to spray for capsid bugs is during the week or ten days immediately preceding the opening of the blossom; and it may be necessary to spray again after the petals have fallen. The best wash to use is a nicotine soap spray as recommended for Apple Sucker and Aphis:—Nicotine (95 per cent. purity), $\frac{3}{4}$ oz.; soft soap, $\frac{1}{2}$ lb.; water, 10 gallons.

The Royal Academy.—The pictures at this year's Royal Academy include many studies of the garden, beautifully executed, and the favourite months chosen for the sketches are May and early June. Lilies, Delphiniums, and Rambler Roses record the sunny hours of summer in England. Among the water colours is the study of a garden painted by a masterly hand, and the view taken from a great height. The name of the picture is "The Garden Path," and the artist, Sir Edward J. Poynter, P.P.R.A. A delightful piece of work is contributed by George Marks, the subject, "A Garden in Surrey." There are flowers in abundance, an arch of Lady Gay Rambler Roses, Nasturtiums, Antirrhinums, and Delphiniums, all combine to make a mosaic of colour, with an old English homestead as background. "A Garden," by Frances Drummond, has cool repose, with Fir trees and herbaceous border of Larkspurs. Cyril Ward produces a lovely effect with a tangle of Sweet Williams, Canterbury Bells and Auriculas, and Lilian Stannard is quite in her usual form with the exquisite garden path lined with Lilies, big Poppies, and Roses, with the rambling old house as centre-piece. The picture No. 706 is full of detail and brilliant colouring, with golden Lilies and Campanulas, and another sketch shows a charming gateway by G. Sheridan Knowles, with cut Yews, Laburnums, and a peacock. The still-life groups are very attractive. A blue Wedgwood jug standing on an antique leather book and filled with Wallflowers is cleverly put together. "Yellow

Roses," by Winifred Walker, an habitué of the Royal Horticultural Society's Meeting, whose work is well known to horticulturists, is a painting fresh and clear in colouring and is a study of two blooms in a stem glass, and bud on an oak table. No. 767 is a large painting of white Primulas in a metal bowl very cool and restful. Bertha Fowle has two drawings of flowers of paler tints, whilst Ann Maitland contributes a glowing subject of bright Tulips in a flowered vase, other features being a jug with rich Polyanthus, an elusive sketch of Paeonies, and a detailed drawing of Larkspurs. There are some gorgeous still-life groups in the large rooms. The picture which claims notice most is by H. Davis Richter, and is a bold study, in oils, of white Hydrangeas, Paeonies and Lilac, in a glittering brass bowl. Just above it is another fine work, "Delphiniums," by J. Ernest Foster—these flowers are portrayed in an emerald-green pottery vase, on a shimmering greeny-blue cloth. "Ranunculus," by Melton Fisher, is full of colour: and "Chrysanthemums," by Ida Mostyn, is a fine study in a silver bowl. H. Davis Richter contributes a bold sketch of wild flowers from Exmoor, and No. 337 is a charming group of Anemones. We see more wild flowers in a bowl of Buttercups, by Elizabeth Hancock; and a simple study of Autumn flowers in "A Country Bouquet." Ethel Wright's picture of "Flowers from my Cottage Garden" is a vivid mass of colour, and the smaller still-life studies show cottage flowers, Stocks, Anemones and Grapes, Paeonies by an open window, Nerines, and a fine study of a bunch of black Alicante Grapes. The garden scenes are again well represented, Alfred Parsons, R.A., showing one of his best, with Lilies in the garden of an old house, also another garden of Delphiniums and golden Lilies. Delphiniums are the favourite theme in the floral section of the pictures this year, closely run by the Wallflower.

State Aid for Agricultural and Horticultural Research.—The Government proposes (if Parliament agrees) to expend during the next five years about £2,000,000 on agricultural research and agricultural education. The scheme of the Board of Agriculture for the expenditure of the liberal funds now to be placed at its disposal for agricultural education and research will offer substantial scholarships to men who have distinguished themselves in the natural sciences at the Universities. It is believed that a number of these young men will gladly devote themselves to a special line of study if they are assured of a modest income—say, £200 per annum over a period of years, and if after these years they are given opportunities of earning reasonable salaries in research work. From the more successful of these students a certain number will be selected for employment in Universties and other institutions. The kind of research that it is proposed to encourage is already represented in this country at Cambridge, Rothamsted, Bristol, and Reading; but at present there are probably not more than forty men in England and Wales engaged on pure research in agricultural science. It is hoped that during the next decade or so the number may be raised to about 150, and the public appreciation of their value largely extended. Another feature of the Board's scheme will be the encouragement of higher agricultural education in colleges by means of grants and in other ways. A third section of the plans of the Board deals more directly with the immediate interests of the farmer, the smallholder, and the ambitious labouring man. Most of the Education Committees of the counties handle agricultural and horticultural education. As a rule they maintain a travelling staff, which advises farmers, organises classes, and so on. Adequate funds will now be available to treat these committees generously. For every £1 the local authorities expend on agricultural education they will now receive at least £2 from the State. It is believed that with this inducement the majority of the counties will set up farm schools or farm institutes where men may go for winter courses and women for summer courses, and where school teachers may be instructed in the agricultural and horticultural subjects to be taught in the new continuation schools.

CROPS AND STOCK ON THE HOME FARM.

SEED SOWING.

When sowing corn at any season of the year the surface of some land, owing to continuous rain or other causes, is so hardened that harrows, or even heavy drags, will not break the crust. Soil in such condition does not make a good seed bed and something is needed to break the surface preparatory for the drill or broadcast sowing of the seed.

With a Massey-Harris cultivator much time is saved, as with a seed box attached any quantity of seed of Wheat, Barley, Oats, Peas, Vetches or Sainfoin can be sown per acre. The machine is so arranged that the seed drops immediately in front of the coulters or tines, which bury the seed at an even depth and crack the surface soil at the same time. To obtain the desired finish, all that is required is to draw sharp tined harrows over the surface twice; in exceptional circumstances of hard clods or weeds an extra harrowing or two is necessary.

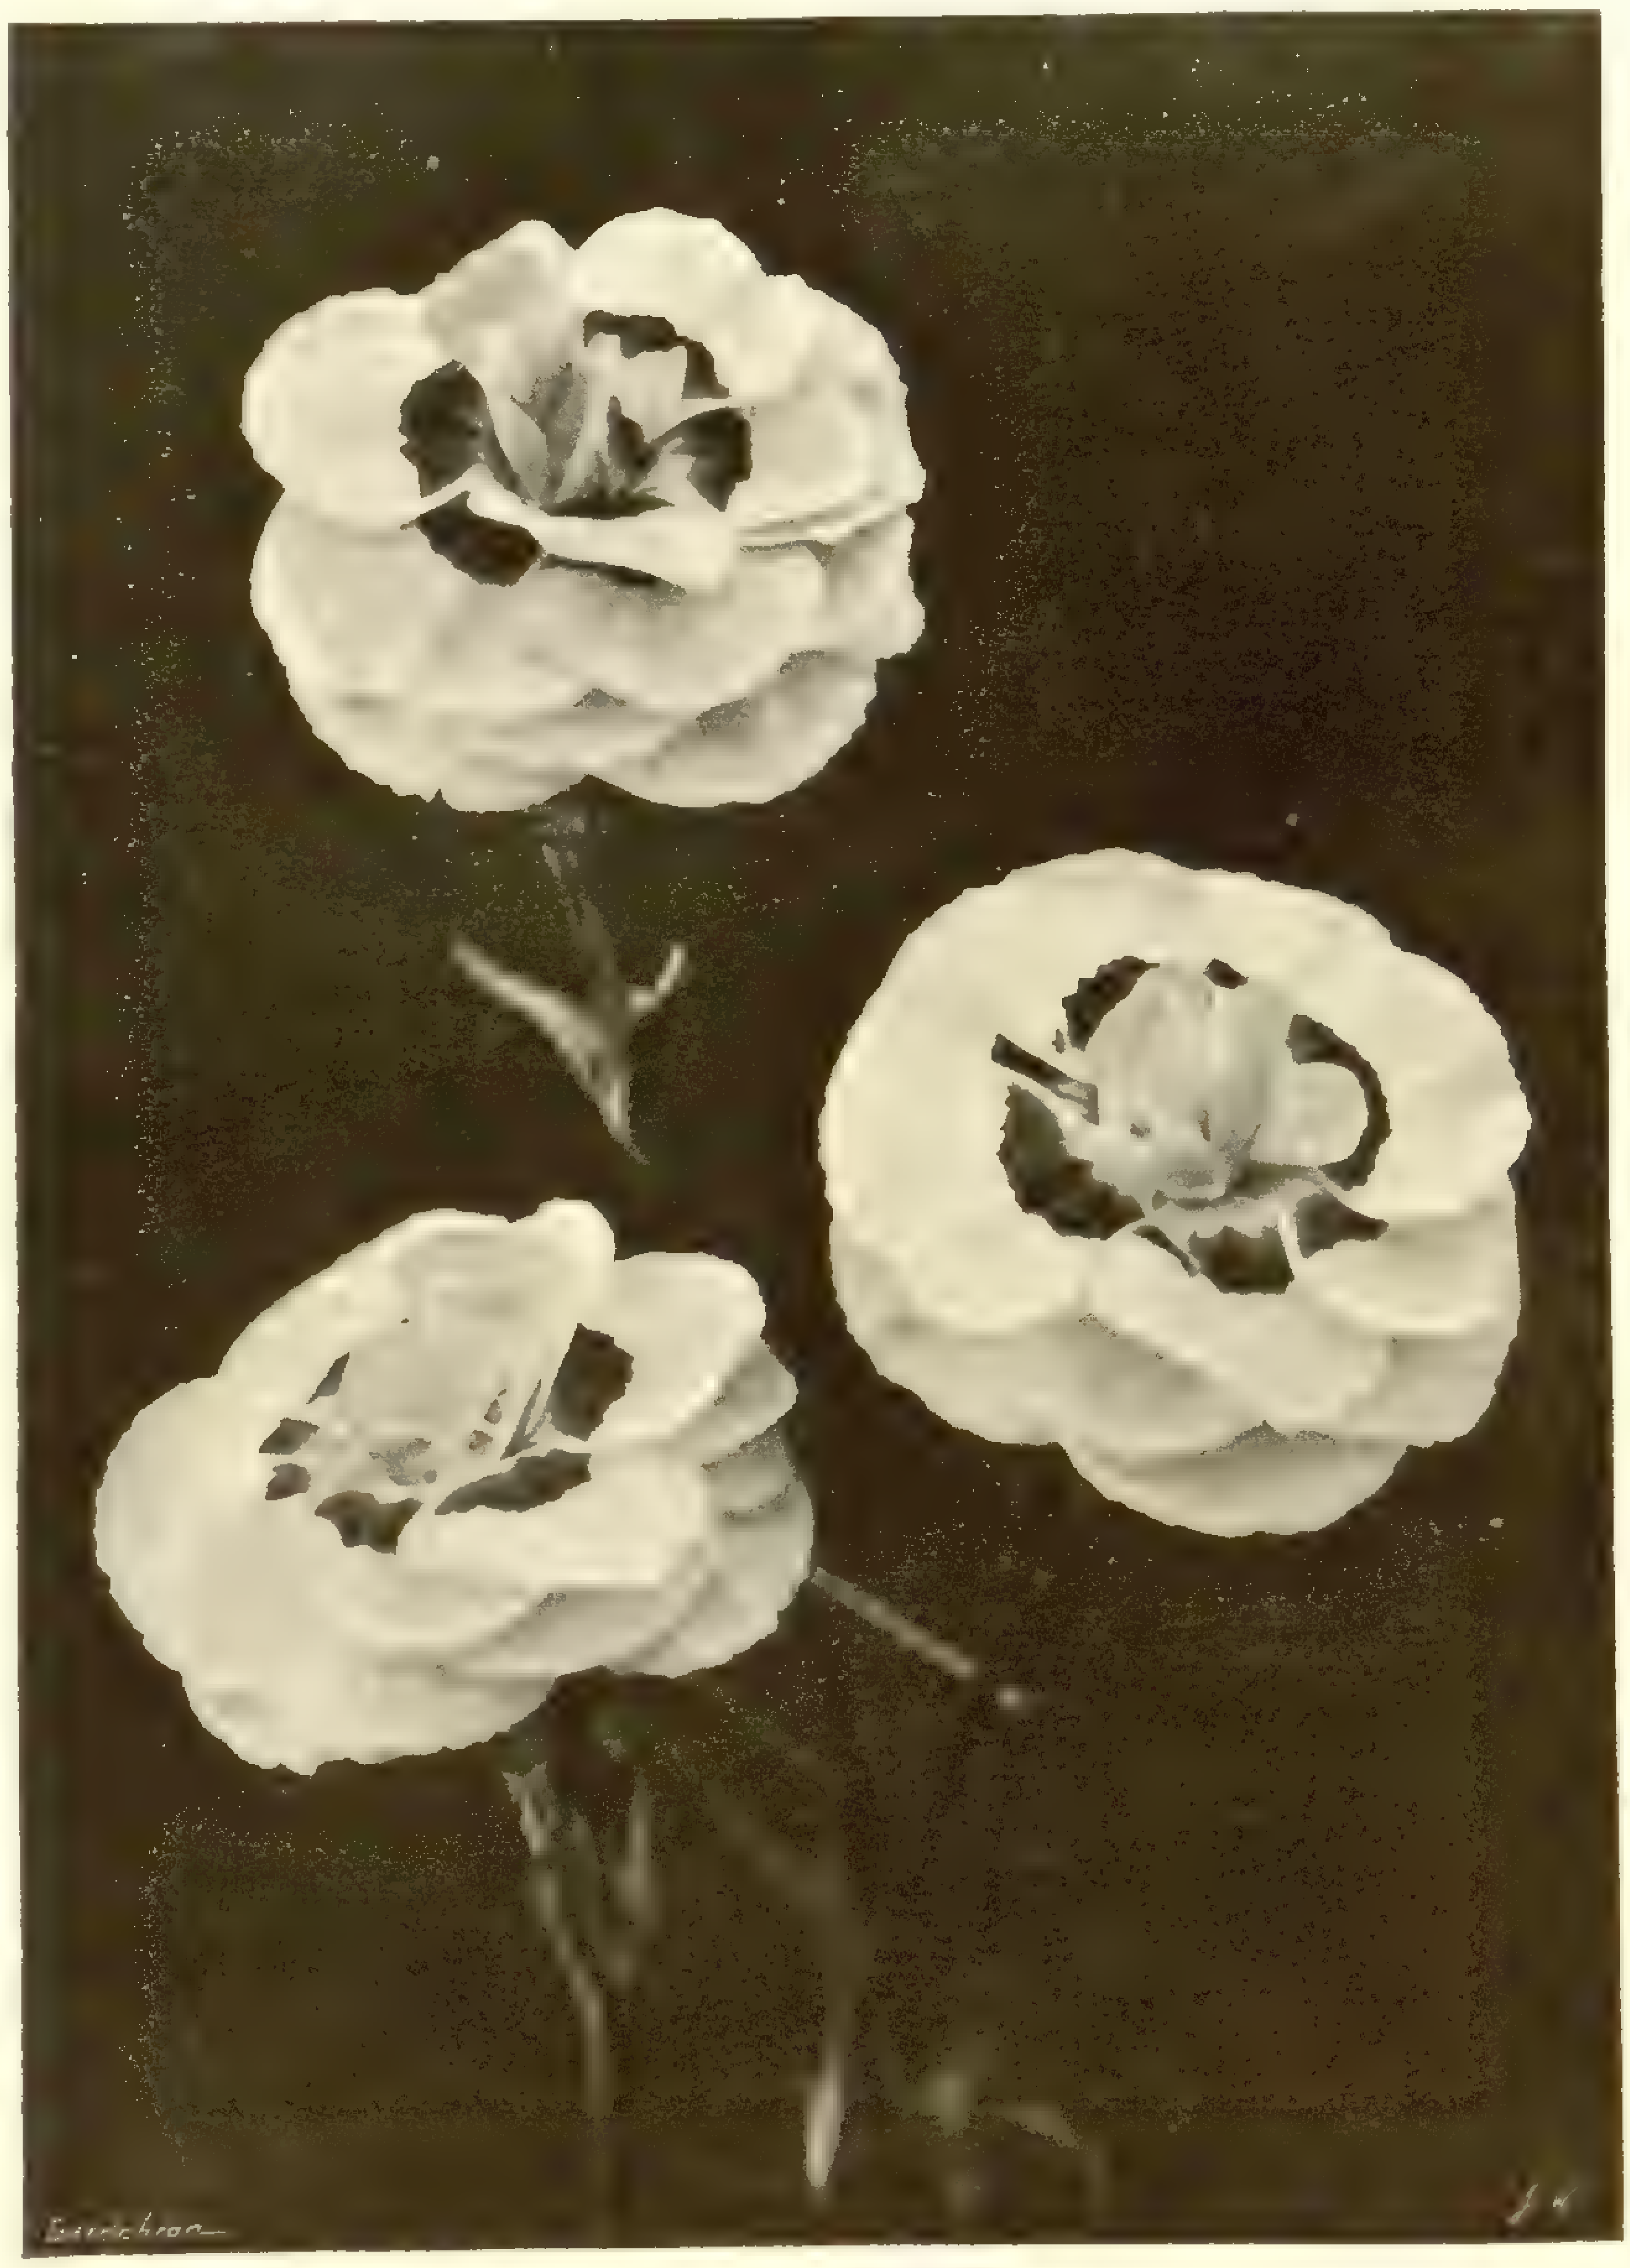
A full sized 7-feet Massey-Harris cultivator requires three horses to get over a good scope of land, say, 10 acres per day, especially where the soil is heavy, hard or weedy on the surface.

Where cereals are not drilled I regard this as the most satisfactory method of sowing them.

With an efficient, well-managed drill the seed is sown evenly and at the right depth, which ensures a more regular germination and subsequent even growth, which means a more even stage of ripening.

In the place of a drill or a Massey-Harris cultivator many persons sow their corn by hand from a seedlip. In a small way this method may answer, but where twenty acres per day is to be sown by one team I prefer a Broadcaster covering a width of 16 feet, drawn by two horses, which distributes the seed evenly over 20 acres per day. To "break in" the seed drags or harrows as the case may be are employed, giving sufficient "work" to the surface as is necessary.

For the sowing of small seeds such as Cabbage in a bed for planting; Onions, Carrots, or even Mangold in a small way, I use a small, one-coulter drill, which one man pushes in front of him sowing the seed evenly, which afterwards should be covered with light hoeing. *E. Molyneux.*



CHELSEA SHOW.
FIG. 125.—PINK MODEL, EXHIBITED BY MR. C. H. HERBERT.
(See awards by the Floral Committee, p. 258.)

ROYAL HORTICULTURAL SOCIETY.

EXHIBITION AT CHELSEA,

May 20, 21 and 22.

THE Royal Horticultural Society is to be congratulated on the great success which attended its exhibition in the beautiful grounds attached to the Royal Hospital, Chelsea, during the Tuesday, Wednesday and Thursday of the present week. The weather was gloriously fine, but the brilliant sunshine was tempered by a cool wind, so that the atmosphere inside the tents was never oppressive, whilst the arrangement of the tents made for comfort in inspecting the exhibits. The show was well attended, and on the first day Queen Alexandra, accompanied by the ex-Empress Marie of Russia and Princess Victoria, paid an early visit, whilst later in the same day the Duke of Connaught also gave the exhibition his patronage. Many Belgian, French and Dutch horticulturists were present, and they expressed surprise at the extent and importance of the show.

In these times of transport and labour difficulties it was only to be expected that the show would not be equal in extent to those of pre-war times. Rock gardens, water gardens, pergolas and similar garden features arranged in the open have, in the past, constituted some of the chief attractions of these great Metropolitan flower shows, but it is not an easy task to plant improvised rock and water gardens in a short time in places where the natural amenities must be respected. It was therefore not surprising that the outdoor exhibits of this character were of much less importance than usual, although several well-designed rock gardens were forthcoming, as may be seen from the one illustrated in Fig. 129.

With regard to indoor flowering plants, including Orchids, which are nowhere shown finer than at these spring exhibitions of the Royal Horticultural Society, the exhibits were not so numerous as usual, but the reduction of numbers only had the effect of raising the standard of quality. Messrs. Armstrong and Brown's collection of Orchids was the most artistically arranged display in the show, and was awarded the Coronation Cup, offered for the most meritorious exhibit. We missed the large exhibits of stove plants and Ferns, which have been great features in former years, but there were plenty of bright flowers, including Roses, Rhododendrons, Tulips, Sweet Peas, Irises, and Carnations, whilst hardy border flowers and alpines were prominent in almost all the tents. One of the best floral effects was designed by Messrs. James Carter and Co., who furnished one end of the largest tent with superbly flowered Cinerarias, Primulas, Streptocarpuses, Calceolarias and similar greenhouse flowers. The exhibit of scented-leaved Pelargoniums from the Hon. Vicary Gibb's gardens at Aldenham included all the choicest species in cultivation, the plants being superb specimens. The exhibits of vegetables were very few, but Messrs. Sutton and Sons' collection (see Fig 130) was superb and a subject of general comment. Nor were fruits so freely represented as were to be expected, but the collection shown by the Hon. John Ward was worthy of the high award it gained.

As stated in our last issue, the Society had determined to make the Show as educative as possible, and a large space was devoted to exhibits of an educational and scientific nature, which are referred to in our report. On the opening day Dr. Keeble, F.R.S., gave an address in the conference tent on "Horticultural Education and Research," and on the Thursday Dr. Rendle, F.R.S., gave a popular address on the "Educational Aspect of some of the Plants shown." Both these meetings were well attended. In addition, there were meetings of the Horticultural Trades' Association, the National Sweet Pea Society, and the National Tulip Society in the show grounds, so that altogether it was a busy time for horticulturists.

Orchid Committee.

Present: Sir Harry J. Veitch (in the chair), James O'Brien (hon. Secretary), H. G. Alexander, Pantia Ralli, F. Sander, Arthur Dye, H. J. Chapman, W. H. White, A. A. McBean, W. H. Hatcher, S. W. Flory, Walter Cobb, E. R. Ashton, W. Bolton, J. Charlesworth, Gurney Wilson, C. Cookson, R. G. Thwaites, J. Cypher, R. A. Rolfe, and Stuart Low.

Fifty novelties were entered to go before the Committee, and over twenty awards were given.

AWARDS.

First-Class Certificate.

Brasso-Cattleya speciosa Gatton Park variety (C. Schröderae albens × B.-C. Digbyano-Mendelii Fortuna), from Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. J. Collier). One of the finest of white Brasso-Cattleya of large size and perfect form. A very charming flower in every respect.

Laelio-Cattleya Excelsior Ashtead Park variety (C. Mendelii × L.-C. Canhamiana alba), from PANTIA RALLI, Esq. (Orchid grower, Mr. Farnes). A noble flower of perfect shape, and broad in all its parts. Sepals and petals white, lip rich rosy-crimson.

Sophro-Laelio-Cattleya Anzac, var. General Birdwood (L.-C. Dominiana × L.-C. Marathon), from Messrs. CHARLESWORTH AND Co. This and the second form of S.-L.-C. Anzac next described are distinct advances in their sections, the flowers being large and brilliantly coloured. Sepals and petals rose-red, with a scarlet glow. Lip rich crimson.

Sophro-Laelio-Cattleya Anzac, var. Lutetia, from Messrs. CHARLESWORTH AND Co. A charming variety, rather smaller and lighter in colour than the preceding, but if anything better in shape.

AWARD OF MERIT.

Odontoglossum crispum xanthotes var. Princess Mary. A noble snow-white flower, with some lemon-yellow spots on the petals.

Odontioda Dulcies var. militaris. A brilliant scarlet flower, lighter in tint than Oda. Chantecleer.

Odontioda Automa var. May (Oda. Bradshawiae × Odm. Harryanum). A fine claret flower, with longitudinal whitish markings on the petals and some irregular white lines on the sepals.

Odontoglossum Doreen (eximium × Empress of India). Large, and of fine form, rich claret with lighter tips to the segments.

Odontoglossum Aphrodite var. Nora (eximium × President Poincare). Richly blotched with violet-purple, with white margins and front to the lip.

The above from Messrs CHARLESWORTH AND Co.

Odontoglossum Brownii (Mars × crispum), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A grand flower of a deep, claret red colour, with clearly-defined white margin and front to the lip.

Odontoglossum King Emperor (Colossus × crispum Leonard Perfect), from Messrs. ARMSTRONG AND BROWN. The plant bore two noble flowers, white with the inner two-thirds rich claret-red.

Brasso-Cattleya Aida Orchidhurst variety (C. Mendelii × B.-C. Digbyano-Mendelii), from Messrs. ARMSTRONG AND BROWN. A charming white flower, large, and of perfect form, white with chrome yellow disc to the lip.

Odontoglossum crispum Linda, from Messrs. J. and A. MCBEAN. A charming variety with finely-formed white flowers, having a few dark spots on the segments.

Odontoglossum eximium Leonora, from Messrs. J. and A. MCBEAN. A richly coloured flower of fine shape, the inner two-thirds of the segments being ruby-red.

Odontioda Thela, from Messrs. J. and A. MCBEAN.

Odontioda Joan var. illustris (Oda. Charlesworthii × Odm. ardentissimum), from Messrs. J. and A. MCBEAN. A very fine hybrid of Odontoglossum size, dark chocolate purple with rose-red lip.

Odontioda Gladys var. Invicta, from G. W. BIRD, Esq., Manor House, West Wickham (gr. Mr. Redden). One of the finest of Mr. Bird's Odontiodas, the flower being large, bright rose heavily blotched with maroon-purple.

Odontioda The Dell Duchess (parentage unrecorded), from Baron Bruno Schröder, The Dell, Englefield Green (gr. Mr. J. E. Shill). An improvement on Oda. Coronation, the large flowers being heavily blotched with bright red with intervening white lines.

PRELIMINARY COMMENDATION.

To *Odontioda Schröderi Goliath*, with large buff flower, from Messrs. CHARLESWORTH AND Co.

CULTURAL COMMENDATION.

To Mr. FARNES, Orchid grower to Pantia Ralli, Esq., for a grand specimen of Cattleya Mossiae Arnoldiana.

GROUPS.

The Orchids well filled the whole of the side staging surrounding the large tent No. 4.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr., Mr. J. Collier), represented the amateur Orchidists with a magnificent group, many of the best of the hybrids having been raised at Gatton Park.

The group, which was very effectively arranged, contained representatives of over 100 distinct hybrids and the finest selection of species seen at any show during the last five years. Odontoglossum crispum included ten superb and distinct varieties, Elsie, Magnum Bonum, Mary Colman, Lulu, Colmaniae, Solum, Lady Colman, Ronald, G. F. Moore, Queen Empress and F. M. Ogilvie being the best forms of that beautiful and variable species. Two forms of O. Gatton Emperor were included, the largest, the variety Augustus, having deep claret red flowers with white margin and violet lip. Extremes of O. Pescatorei were the white variety virginalis, and the spotted form Duchess of Westminster. Six distinct crosses of Brasso Cattleya had for their best the white Queen Alexandra and two handsome blush-white dissimilar forms of B. C. speciosa. The Cattleyas were some of the best coloured varieties of C. Mendelii, a selection of white Cattleyas, albinos of many species, being also present. A large and varied selection of Laelio-Cattleyas gave rich tints of rose and crimson, over which the arching sprays of Cymbidiums and scarlet Odontiodas displayed themselves effectively. The compact batch of handsome forms of Lycaste Skinneri, included delicatissima alba Purity, hellemense, and others; while the quaint Masdevallias and elegant Cirrhopetalums gave interest to one of the best groups of the year.

Messrs. ARMSTRONG & BROWN, Orchidhurst, Tunbridge Wells, at the entrance of the tent, staged a large and most tastefully-arranged group replete with rare plants and novelties. The elevated convex centre was of brilliantly coloured Odontiodas fronted by clear white

Odontoglossums, the side elevations being of richly coloured hybrid Odontoglossums with white and rose Miltonias, brilliantly coloured Laelio-Cattleyas and showy Cattleyas occupying the body of the group. Specially fine were Odontoglossum crispum Snowdrift, a very fine white; O. c. Melba, O. c. His Majesty and O. c. Invicta, richly blotched forms; O. Armstrongii var. Peerless, O. Brownii (Mars × crispum) chocolate red; O. St. Mungo and O. King Emperor, large and finely marked. Among the Cattleyas, C. Mendelii Sir Harry J. Veitch is a grand addition to the pure white forms, and Laelio-Cattleya Canhamiana splendens represents one of the best forms of that showy old favourite. A very fine form of Odontioda Henryi Orchidhurst variety (O. harvengteuse × C. Noezliana) and Brasso-Cattleya Aida Orchidhurst variety, were also specially good.

Messrs. Charlesworth and Co., Hayward's Heath, staged a very effective group, in which their magnificent strains of hybrid Odontoglossums and Odontiodas were displayed in profusion. The salient feature in the group was the masses of the fine forms of Miltonia vexillaria and hybrids of it raised by the firm. The largest, best and richest in colour still appears to be Miltonia Charlesworthii, the best forms of which have never been excelled. M. vexillaria Lyoth, fine forms of M. Bleuana and other hybrid Miltonias effectively arranged with white Odontoglossums and scarlet Odontiodas were a fine feature in the group. Among species, the old-time favourites, Vanda teres and V. suavis appeared with Coelogyne Dayana, whose long drooping sprays of brownish flowers always attract attention. Five new handsome Odontiodas were included, with Sophro-Laelio-Cattleya Anzac var. Lutitia, and some new Odontoglossums were also shown.

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common, commenced on the other side with a very effective display, in which most of the leading kinds in flower now were represented. In a selection of Miltonias there was a very fine form of M. vexillaria Lyoth; Sophro-Laelio-Cattleya Pandora had rich, bright red flowers with dark crimson lip; Laelio-Cattleya Helius, with pale-yellow flowers and rose-tinted lip; and L.-C. callistoglossa magnifica had large and richly-coloured flowers, the lip being very broad and darkly coloured, were all very fine.

Messrs. Mansell and Hatcher, Rawdon, Yorkshire, staged a large and well arranged group, the centre consisting of handsome Odontoglossums and Odontiodas in rich colours, relieved by the white Odontoglossums beside them; Odontioda Brewii, Rawdon var., was the finest dark one. Miltonias were also finely shown in the group with excellent Cattleyas, Laelio-Cattleyas, and Brasso-Cattleyas. Among species, the scarlet Renanthera Imschootiana and the green and black Coelogyne pandurata were noted.

Messrs. J. and A. McBean, Cooksbridge, continued with an excellent group, in which the Odontoglossums and Odontiodas, for which the firm are famous, were well displayed. The central plant at the back was Cymbidium Lowianum arching over scarlet Odontiodas and white Odontoglossums. On each side were raised masses of finely-coloured Odontoglossums with brilliant scarlet Masdevallias, the yellow and brown Oncidium McBeanianum and showy Miltonias. Specially fine was the new Odontoglossum eximium Leonora, of fine shape and colour, and O. crispum Linda, a model white with a few dark spots on the petals. This and the group of Messrs. Armstong & Brown were the best arranged Orchid exhibits.

Messrs. Flory & Black, Orchid Nursery, Slough, had an extensive and well arranged group of fine specimens, among the Laelio-Cattleyas being a good selection of L.-C. Fascinator and other showy hybrids. Among the novelties the best were Laelio-Cattleya H. T. Pitt (L.-C. Bella × C. Enid), a grand flower adhering closely to the Cattleya in form and with broad rose-coloured sepals and petals and a rich crimson front to the lip. Cattleya The Bride (Warscewiczii alba Firmin Lambeau × Dusseldorfii Undine), a fine pure white, the spike bearing three flowers; Cattleya Empress Frederick var. Vesuvius, of brilliant colour, and Odontoglossum Miriam (parentage unrecorded), one of the largest and best in form, the broad segments bearing large rosy-mauve blotches with thin intersecting white lines, the front of the lip being white, were included.

Messrs. J. Cypher & Sons, Cheltenham, staged a fine group in which were an unusually large number of fine specimen plants, one of the many good forms of Laelio-Cattleya Fascinator having six spikes bearing together twenty-two flowers. Several of the smaller specimens had four to five flowers on a spike, and L.-C. Bedouin and others were equally well bloomed, as also were forms of Laelia purpurata and showy Cattleyas. The pale yellow Dendrobium Dalhousianum luteum and other Dendrobiums, barbigerum, whose motile labellum always attracts attention.

Messrs. Sanders, St. Albans, showed a group of the favourite Cymbidium insigne Sanderi, introduced by Messrs. Sanders, who received a F.C.C. for it, February 14, 1905, as Cymbidium Sanderi, and later three varieties each obtained F.C.C.'s. This fine form was instrumental in producing many of the handsome hybrid Cymbidiums of to-day, while as an easily-grown, free-flowering Orchid of elegant habit few can excel the type parent. In 1906 a form collected by a Continental explorer was introduced but proved very inferior to the original, and hence the best type has often the varietal name Sanderi attached.

Pantia Ralli, Esq., Ashtead Park, Surrey (Orchid grower, Mr. Farnes), staged a pretty group of splendidly-grown Cattleyas, Odontoglossums and Odontiodas, the front centre being a brilliant scarlet group of Sophronitis grandiflora, with the fine yellow Odontoglossum aureola and O. crispum aureum Holdeni, the richly-coloured O. c. Black Knight, the quaintly-marked O. c. Lady Jane and the allied O. c. Oakfield Sunrise. The specimen Cattleyas and Laelio-Cattleya were very fine.

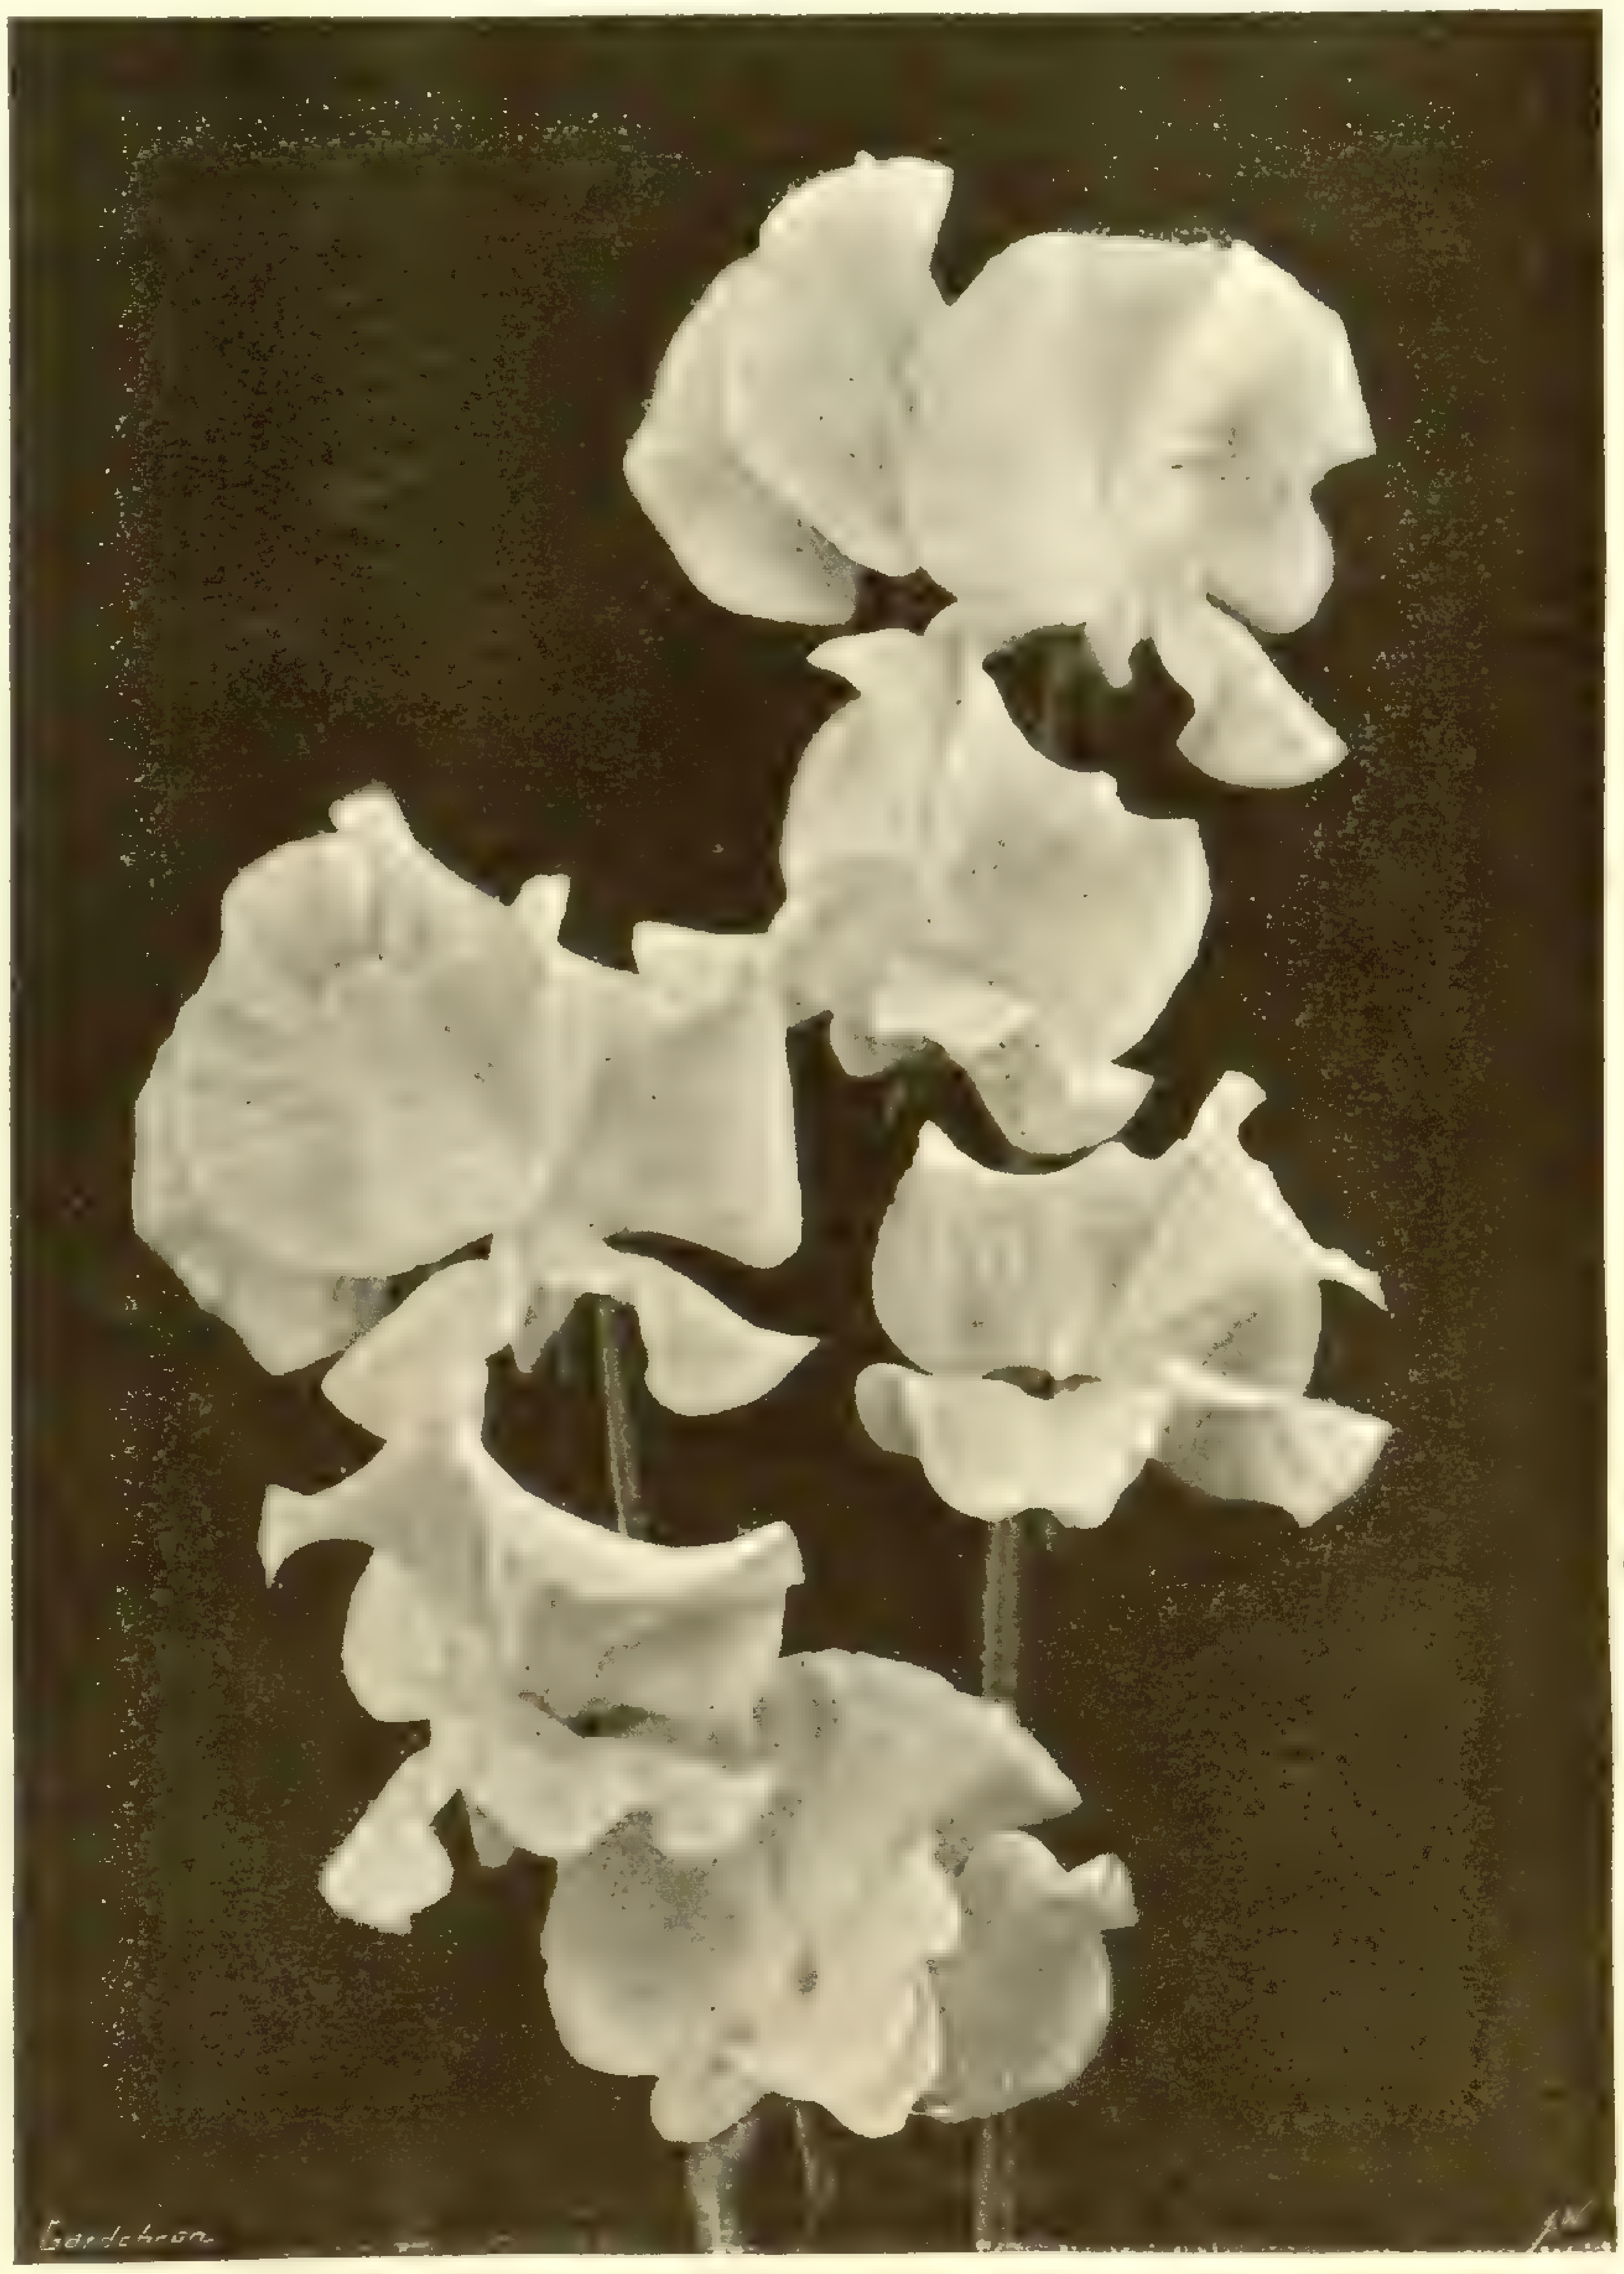


Fig. 126.—Sweet pea Hawlmark Pink, exhibited by Messrs. Alex. Dickson and Sons (See p. 258.)

some bright scarlet Masdevallias and interesting species were shown, including good specimens of Cirrhopetalum Colletti, Cypripedium Maudiae and C. callosum Sanderae.

Messrs Stuart Low & Co., Jarvisbrook, Sussex, finished the side with a group of brightly coloured Orchids, the centre being filled with orange-coloured Laelio-Cattleya, G. S. Ball, fine forms of Cattleya Mendelii and C. Mossiae, including white varieties. At the sides were scarlet Odontiodas and Renanthera Imschootiana. Good forms of Odontoglossum crispum and hybrids were effectively arranged, and among the species the white Phalaenopsis amabilis Rimestadiana, Lycaste Skinneri, both white and coloured varieties, the blue Dendrobium Victoria Regina, and the curious Bulbophyllum

H. S. Goodson, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day) showed Odontoglossum percultum, Goodson's variety, one of the finest and richest in colour of its class and with grand spike flowers. Richard Ashworth, Esq., Ashlands, Newchurch, Manchester, showed a very dark form of Odontioda Brewii.

Floral Committee.

Present: Messrs. H. B. May (in the chair), George Paul, J. W. Barr, W. J. Blakey, H. Cowley, W. B. Cranfield, W. Cuthbertson, T. Stevenson, C. Dixon, J. Dickson, C. Elliott, C. R. Fielder, John Green, John Heal, G. Harrow, W. Howe, A. Ireland, E. H. Jenkins, J. F. McLeod, J. W. Moorman, S. Morris, H. J. Jones, W. H. Morter, C. E. Pearson, F. Page-Roberts, G. Reuthe, W. P. Thomson, A. Turner, and R. W. Wallace.

AWARDS.

FIRST-CLASS CERTIFICATE.

Paeonia Willmottiana (see fig. 123).—This fine new plant is a recent introduction from China. It grows about 28 or 30 inches high, has handsome deep green foliage, with a faint grey tomentum on the surface and a very downy underside. The flowers are about six inches across, pure white, with a central boss of crimson stamens tipped with yellow anthers, and with red-tipped stigmas pushing through the cluster. The flowers usually have eight or nine segments. It is a perfectly hardy species and has come through the last two winters without the least protection. Shown by Miss WILLMOTT, Great Warley, who raised it from seed sent from China.

AWARDS OF MERIT.

Sweet Pea Hawlmark Pink (see fig. 126).—This lovely Sweet Pea was finely shown by its raisers and in such a way that visitors could judge of it in the mass. The blooms are of the largest size, and there are usually four on a spike and all elegantly placed. The colour is light pink with a subtle flushing of salmon-cerise that makes the variety particularly bright and attractive. Shown by Messrs. ALEX. DICKSON AND SONS, Newtownards.

Sweet Pea Brocade.—An interesting bicolor Sweet Pea, bearing very large and finely formed flowers on strong spikes. The standard is broad and well waved, and the color is satiny rose pink. The wings are of a rosy lavender shade that renders the blooms very distinct. Shown by Messrs. ALEX. DICKSON AND SONS, Newtownards.

Sweet Pea Brilliant.—A shapely variety, bearing four flowers on a spike. The colour is soft, rich salmon-cerise, and a pure self. The standard is nicely waved, and the poise of the blooms is excellent. Shown by Mr. J. STEVENSON, Wimborne.

Schizanthus wisetonensis Snowflake.—A pure white-flowered counterpart of the bright-hued and popular greenhouse plant so well known as S. wisetonensis. The habit of the plant is pyramidal and compact, and the flowers are so freely produced that the foliage is almost hidden. This should prove a useful market plant. Shown by Messrs. WATKINS AND SIMPSON, Drury Lane, W.C.

Rose Covent Garden.—This is a finely formed, richly scented, deep crimson variety, that promises well for the garden and for the cut-flower trade. We have referred to it on several previous occasions in these columns. Shown by Messrs. B. R. CANT AND SONS, Colchester.

FIG. 127.—RHODODENDRON LEPIDO-BOOTHII, EXHIBITED BY MR. E. J. P. MAGOR.

Iris Hoogiana.—A fine upstanding Iris of a lovely blue shade, with deeper shading over the centre of the broad falls and a prominent golden yellow beard on each. There is also a slightly deeper blue colouring in the central channel of the standards and the latter are deeply notched at the apex. I. Hoogiana is stated to be a new species from Turkestan; the young blooms are a deeper blue than those which have been open a day or two. Shown by Mr. W. R. DYKES, Charterhouse.

Iris Turkoman (see fig. 124). A hybrid obtained by crossing Iris Korolkowii with I. stolonifera, the latter being the pollen parent. The flowers are of medium size, the standards bluntly pointed and the tips of the falls rounded. The ground colour is a bronzy shade, and on this there is an exquisite veining of crimson and a bright purplish blue beard in the case of the falls, and purplish shading and veining on the centre of the standards, passing into the deeper hue towards the margins. Shown by Mr. W. R. DYKES, Charterhouse.

Saxifraga Red Dwarf.—When in bloom, this is a very dwarf plant, barely three inches high and the flowers are deep reddish scarlet with a light orange centre. The blooms have six segments in most cases instead of the usual five. Red Dwarf is a glorious alpine, and flowers with the utmost profusion over its mossy growth. Shown by Mrs. LLOYD EDWARDS, Bryn Oerog, Llangollen.

Saxifraga J. C. Lloyd Edwards (see fig. 128). —A mossy Saxifrage, which, when in flower is about four inches high. The blooms are of quite large size, and usually with eight segments, the whole as large over as a shilling. The colour is deep rose-red, almost scarlet in the newly-opened flowers, and pink in the older flowers. Shown by Mrs. E. LLOYD EDWARDS, Llangollen.

Rhododendron lepido-Boothii (see fig. 127).—A distinct and interesting hybrid raised by the exhibitor by crossing Rhododendron lepidotum with R. Boothii. The broadly bell-shaped flowers are about 1½ inch across, transparent white, with buff spottings on the three upper segments: the brown anthers add to the general effect. The truss of flowers is hollow instead of piled up as in popular varieties; in other words, the flowers are brought into a regular circle, with the blooms all at practically the same level and pointing outwards. The foliage is neat and very dark green. Shown by Mr. E. J. P. MAGOR, St. Tudy, Cornwall.

Border Carnation, Cleopatra. — A large flowered, broad-petalled variety, very double, and of fine form. The blooms are carried on long wiry stems, and their colour is deep and clear old rose. A distinct and handsome Carnation. Shown by Mr. JAS. DOUGLAS, Great Bookham.

Pelargonium Whiteknight's Glory.—A handsome zonale Pelargonium that appears to be suitable for summer bedding. It has large finely-formed single blooms of a bright, clear orange-salmon colour, carried in large trusses. Shown by Mr. F. BRIGHT, Whiteknights, Reading.

Primula Cooperi (sp. 5567).—A good plant of tufted growth. The long, lanceolate leaves have finely serrated margins and are light green with a densely mealy under surface. The spikes carry a large cluster of flowers, and apparently the inflorescence develops the verticillate form with age. The individual blooms are three-quarters of an inch across, deep bluish purple with a central, five-angled area of intense velvety purple surrounding the eye, which is filled with the yellow anthers. Shown by Messrs. BEES, LTD.

Tulip Sophrosyne.—A large Darwin variety with broad rounded segments in which the colour shades upwards from deep rose to blush with a whitish band down the centre. The handsome base is deep blue. Shown by Messrs. BARR AND SONS, Covent Garden.

Tulip John Ruskin.—A showy May-flowering Tulip, with elongated, shapely blooms. The colour is soft rose, with heavy flushings of orange-buff over the sides of the inner segments. The base is clear yellow. Shown by Messrs. BARR AND SONS, Covent Garden.

Tulip Violet King.—A big Darwin variety with very broad, rounded, dark purple maroon segments and a white base. Very effective and striking. Shown by Messrs. BARR AND SONS, Covent Garden.

Tulip Mrs. Kerrell.—A beautiful Cottage Tulip. The colour is light cerise pink, with basal light blue markings round a whitish centre. Shown by Messrs. BARR AND SONS, Covent Garden.

Carnation Saffron.—A beautiful perpetual flowering Carnation of vigorous growth and with long, wiry stems. The calyx appears to be altogether excellent and non-bursting. The broad petals are slightly wavy and very lightly fringed, and the colour is clear light yellow, with an occasional streak of creamy white on an outer petal. The blooms are full, substantial and carry well. Shown by Mr. C. ENGELMANN, Saffron Walden.

Perpetual Pink Model (see fig. 125).—One of the most charming Pinks we have seen for a long time. It is a pure-bred variety and a descendant from Progress. The colour is clear pink of a medium shade, with basal markings of rich crimson, which make a perfect zone around

the eye. The individual blooms are perfect in outline and the petals lay out as in the old florists' type. Shown by Mr. C. H. HERBERT, Birmingham.

Perpetual Pink Queen Mary.—This is a delightful and vigorous variety, with large double flowers of a deep rich rose-pink shade, with an irregular zone of bright cardinal red round the eye, the latter consisting of a small tuft of petaloid stamens. The broad petals have very slightly fringed margins. Shown by Mr. C. H. HERBERT, Birmingham.

Roses.

MESSRS. PAUL AND SON showed Roses in fine style, and in the big tent they put up a large and very attractive exhibit of weeping standard and bush specimens, all fully flowered and very fresh. Varieties of special merit were Cupid—which occupied the central front position and carried about 30 large, white flowers; Lemon Pillar, very free; the new, pale foliaged, white H. P. Louise Crette; Magnolia, Ambrose Ricardo, Mme. Vanderbilt, Augusta Hartmann (a fine standard), and weeping standards of the popular Wichuaiana and other ramblers. Mr. Geo. Paul told us this was the 58th year in which he had shown at the Royal Horticultural Society's meetings.

A triangular group, set out as a Rose bed, with a ground work of Violas, made up a very pretty exhibit from MESSRS. WM. CUTBUSH AND SON. Standards of Polyantha varieties rose above the general level. At the broad end was a belt of finely-flowered Ellen Poulson, and in the centre a mass of Orleans Rose. Mrs. W. H. Cutbush filled the narrow end, and Baby Tausendschön, Joan of Arc, Jessie, Erna Teschendorff and Yvonne Barbier were grouped around the bases of the standards.

The group of Roses set up by MESSRS. HOBBIES, LTD., contained good pillar specimens of White Lady Gay, White Tausendschön, Dorothy Perkins, American Pillar and Minnehaha; and standards of Lady Godwin, Coronation, Troubadour, White Rambler, Excelsa and Moonlight, all arranged over a groundwork of dwarf Polyantha and other varieties, with groupings of Paul's Scarlet at the end of the exhibit.

A splendid bank of Roses which filled one corner of the large tent was the contribution of MESSRS. WM. PAUL AND SON. Needless to say, this firm's new, brilliant and free-flowering variety, Paul's Scarlet Climber, was conspicuous both as pillar and standard specimens; these were associated with weeping standards of White Dorothy Perkins, Excelsa, Delight, and Tausendschön. Below these and filling the foreground were dwarf bushes of Sunburst, Hoosier Beauty, G. C. Waud, Edward Mawley, Ophelia, Imogen, Le Progrès, the white Louise Crette, and the buff Mme. Charles Lutaud. We believe this was one of the very best groups this well-known firm has ever put up; every plant was fresh, the foliage clean and healthy, and the flowers just at their best.

Messrs. B. R. CANT AND SONS showed cut Roses and pot plants. Their new crimson variety, Covent Garden, occupied the central position, flanked by Golden Ophelia and Cupid. Other good things were Duchess of Wellington, Dean Hole, Emily Gray and Mme. E. Rostand.

A small group of Roses was arranged by Mr. GEORGE PRINCE, and his outstanding varieties were Molly Sharman Crawford, now a popular market Rose; Ophelia, Red Copper Briar, and a weeping standard, unflowered, of the slender-leaved Rosa Watsoniana.

A most effective group of Roses, staged by Mr. ELISHA HICKS, occupied a prominent position in the Orchid tent. At the four corners 9 ft. high pillars of Excelsa (2), Shalimar, and Minnehaha were placed, while in the centre a pillar of Shalimar towered above the rest. The ground work consisted of Princess Mary, Mrs. G. Sawday, the new white Mrs. Elisha Hicks (largely shown), Queen of the Belgians, Mme. E. Herriot, and Rosa Moyesii, with its variety, Brilliant.

Tulips.

Messrs. DOBBIE AND CO. contributed a large display of splendidly grown Tulip flowers. Their large stands of Inglescombe Yellow, Pride of Inglescombe, Inglescombe Pink, Mr. Farncombe Sanders, Clara Butt, Orange Globe, and Louis XIV. were grand, and not less beautiful were their examples of La Candeur, La Tulipe Noir, Edmée, Ellen Willmott, Picotee, Velvet King, Eclipse, Cardinal Manning, Psyche, and Gesneriana lutea—altogether a very fine exhibit.

A very interesting display of Tulips was arranged by Messrs. BARR AND SONS; indeed, there were two exhibits, each filling a high pyramid, and in both instances the flowers were seen to great advantage. The blooms were of fine size, and especially noteworthy were the representations of Mr. Farncombe Sanders, Louis XIV., Inglescombe Yellow, La Tulipe Noir, Clara Butt, Leghorn Bonnet, and Mrs. Moon. Darwin varieties filled one pyramid and in the other pyramid the May-flowering sorts were associated with Old English, Parrot and Rembrandt varieties. Altogether, the Messrs. BARR showed 180 varieties of Tulips, so their display was educational as well as floricultural and spectacular.

In the large exhibit of May-flowering and Darwin Tulips staged by Messrs. JOHN WATERER SONS, AND CRISP, the peincipal varieties were massed in pyramidal fashion, and thus produced a very bold effect: the varieties so treated were Baronne de la Tonnage, Zulu, Miss Willmott, and Gesneriana lutea. The flowers showed, in many instances, the effects of bad weather.

Messrs. HOGG AND ROBERTSON'S display of Tulips included a large selection of the best varieties, all lightly arranged in stands and vases. Here were splendid blooms of Mr. Farncombe Sanders, Gesneriana lutea, Europe, Louis XIV., Inglescombe Yellow, Gala Beauty, the deep heliotrope Ronald Gunn, Clara Butt, and the black Zulu.

A large display of late Tulips with a bordering of giant Bluebells in various colours was made by Messrs. R. H. BATH, LTD. The arrangement was in the form of an elongated pyramid, and a bright effect was produced by the vases of blooms rising tier above tier. Nearly two hundred varieties were presented to view, and among these Bartigon, Calliope, Gala Beauty, Frans Halls' Paris (red-brown with purple base), Eclipse, the dainty Margaret, White Queen, the golden Mrs. Moon and Parisian Yellow, the pink Clara Butt, and The Fawn attracted special attention. The blooms were clean and fresh, but, on the whole, scarcely so large as usually shown by this firm.

MESSRS. ALEX. DICKSON AND SONS thoroughly upheld the high Irish standard of cultivation with a glorious and gorgeous corner exhibit of late Tulips. Rarely, if ever, have finer, cleaner or brighter-hued blooms been seen; in every way the flowers were perfect, and they were arranged in large stands of a variety. Mr. Farncombe Sanders was superb, but, then, so also were the specimens of Clara Butt, Inglescombe Yellow, Massachussetts, Gorgeous, Remembrance, Gesneriana lutea, La Tulipe Noir, Sensation, Sunset, the effective Fairy Queen, Bonfire, Erguste, the deep, dark pink Nauticus, and the very dark, blackish Velvet King, the white La Candeur and the heliotrope Melicette.

In the Orchid tent Messrs. R. WALLACE AND CO. had a large square group composed of Tulips and Irises, and a few Primulas, associated with Japanese Maples. The Tulips were the outstanding feature, and they were clean, medium-sized blooms grouped rather too closely together in large vases, but the colour associations were fine. Picotee, Princess Juliana, Isis, Clara Butt, Orange Beauty, Fairy Queen, Princess Elizabeth and Ellen Willmott were varieties well represented. Two circular groups of Tulips shown by MESSRS. SUTTON AND SONS made bright masses of colour in a tent where they had to compete with Orchids in respect of colour, and they held their own. The flowers were massed well below the eye, so that their handsome bases could be seen easily. Some of the finer varieties were Velvet King, Ariadne, Iris, Nauticus, Wm. Golding, John Ruskin, Europe, Donders, Gedet Parfait, Turenne and Bouton d'Or.

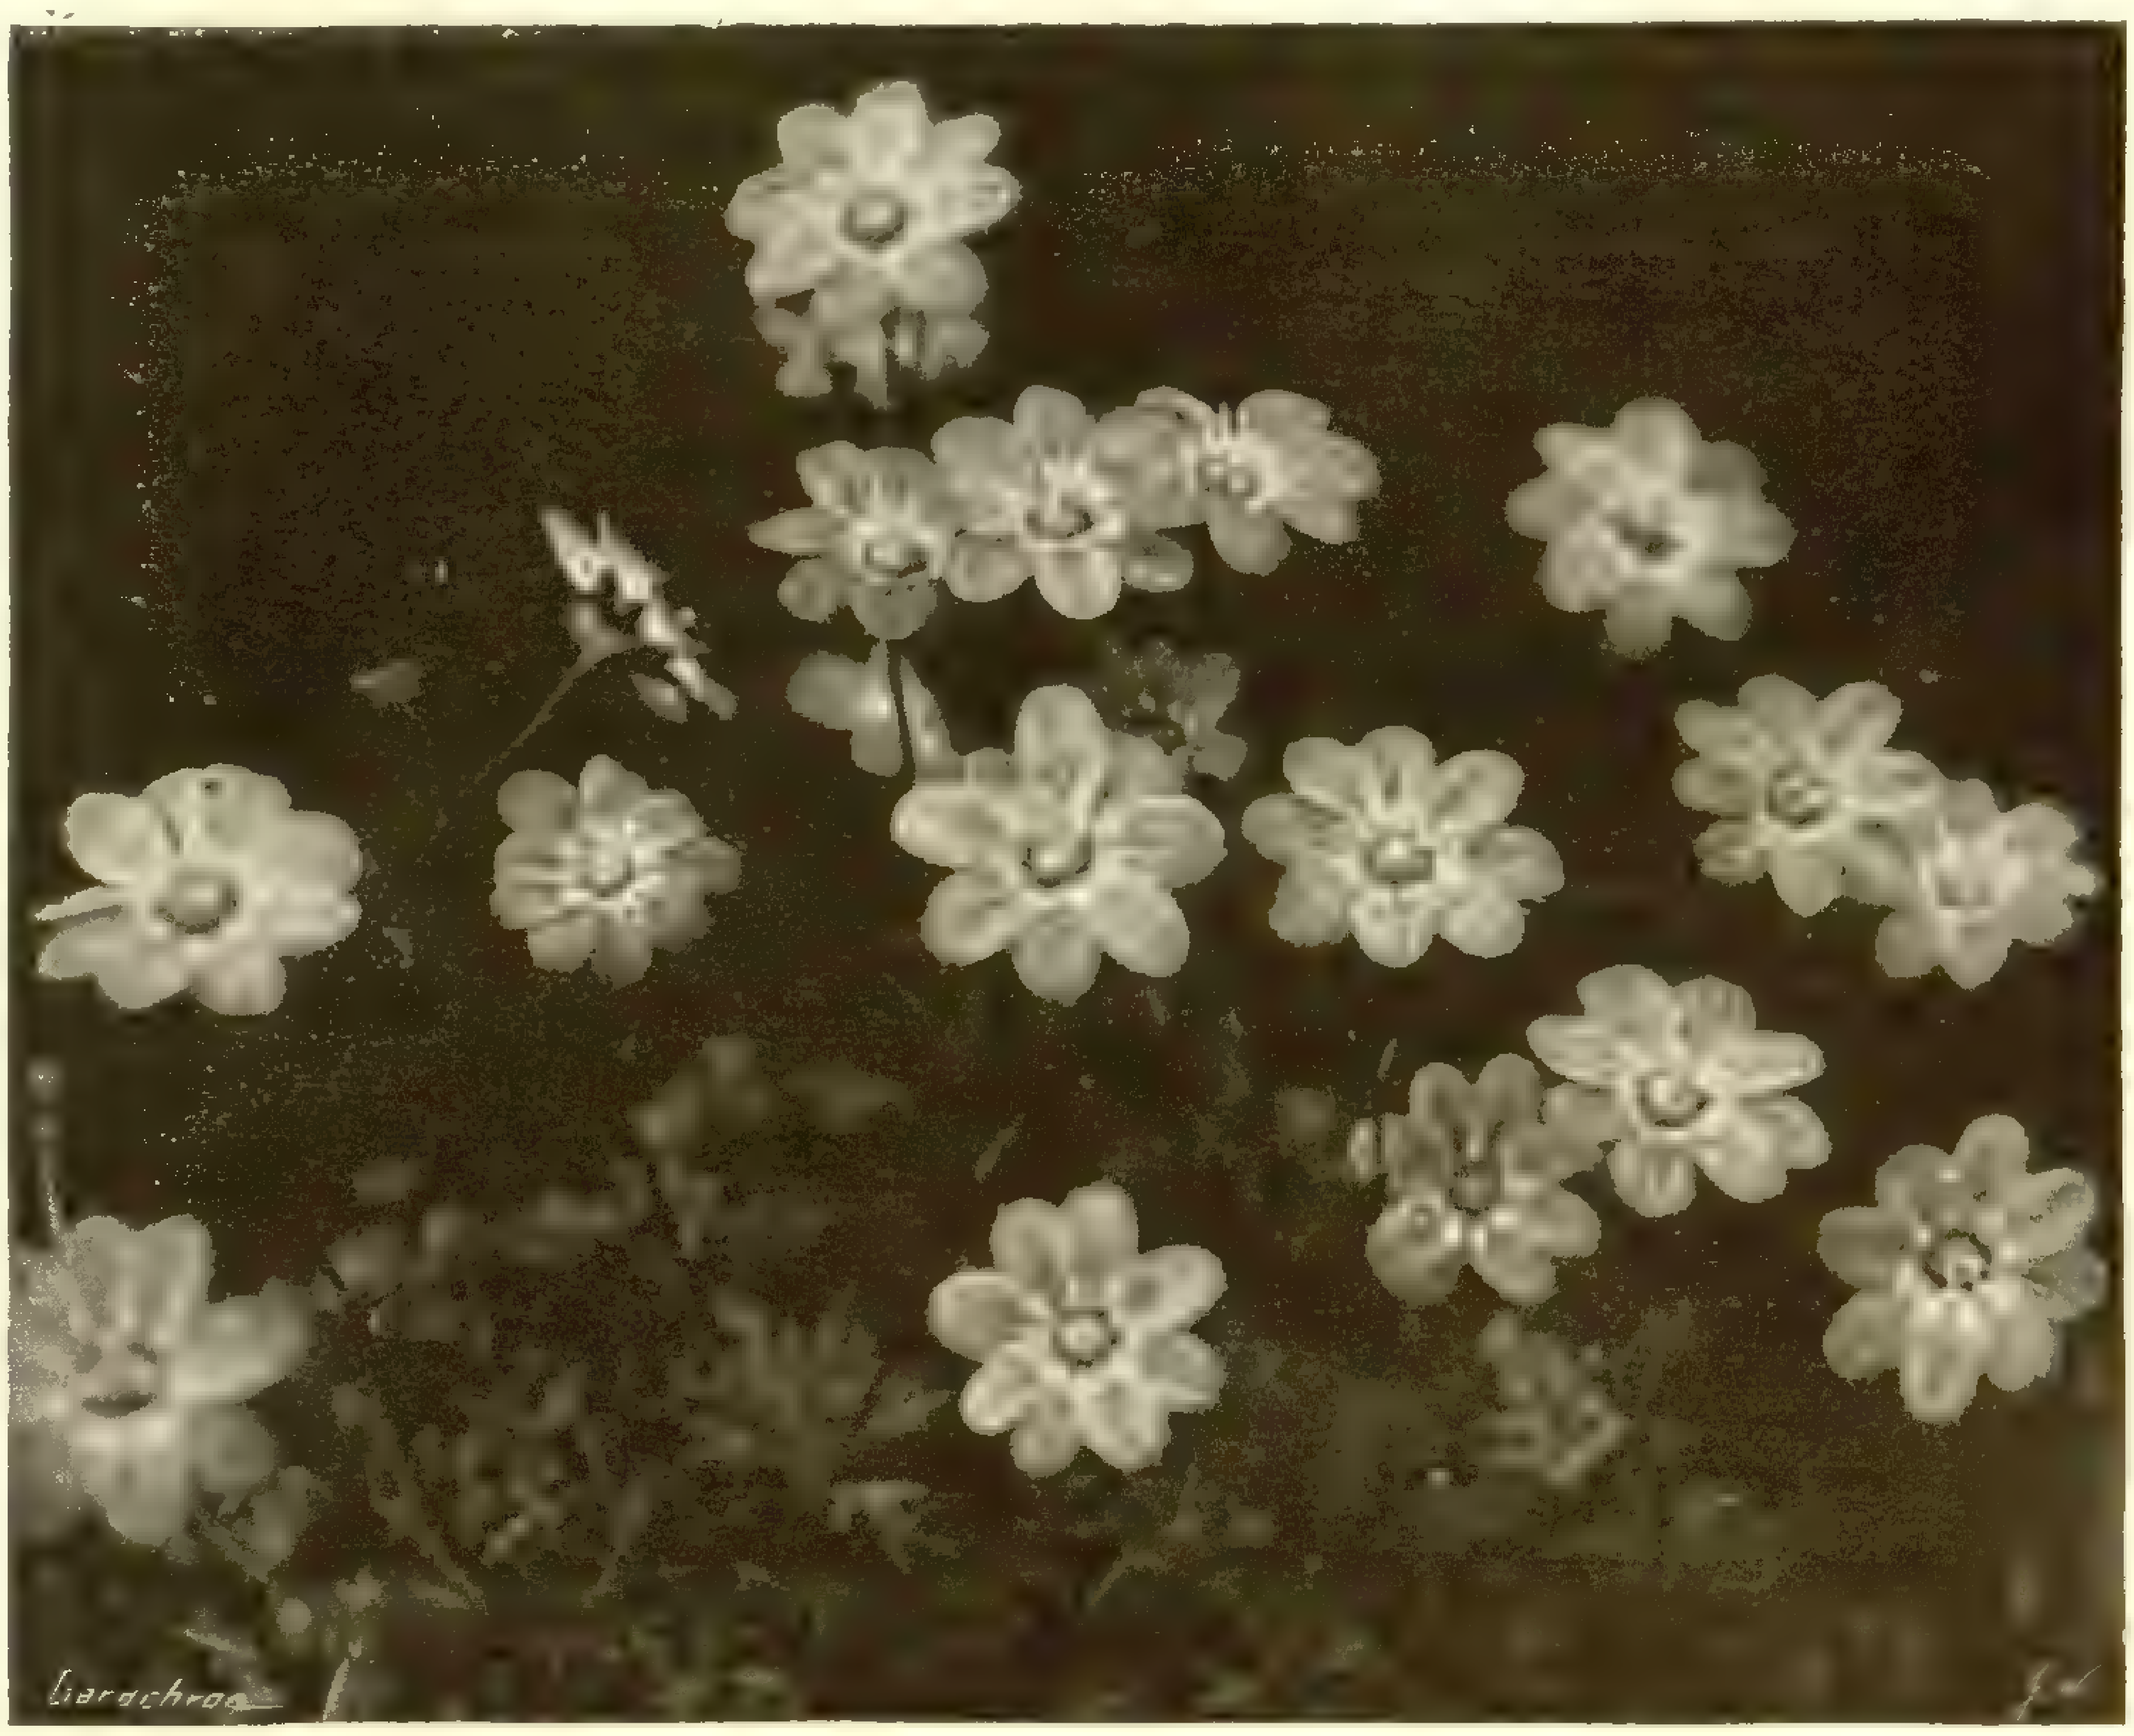

FIG. 128.—SAXIFRAGA J. C. LLOYD EDWARDS, EXHIBITED BY MRS. LLOYD EDWARDS. (See p. 258.)

Greenhouse Plants.

A very imposing group of flowering plants was contributed by Messrs. JAMES CARTER AND CO. Cinerarias in varied colours of the Cactus, Stellata and large-flowered forms, were arranged in mounds towards the back, and relieved with large masses of Calceolaria Clibranii and C. Carter's Victoria Prize; Schizanthus Carter's New Giant Hybrids, light and dark hues; and White Empress, Elizabeth and Crimson King Stocks; Petunias, Streptocarpi, and Primula obconica gigantea were also freely employed, and the specimen Ferns, together with the grass edging which surrounded the

exhibit, brought the whole into a harmonious display. Rarely have we seen an exhibit showing such a variety of colour, and yet nothing clashed.

Messrs. H. B. MAY AND SONS showed a miscellaneous collection of greenhouse flowering plants and ferns. The centre of the group was occupied with fine specimen plants of Hydrangea Avalanche (white), Mme. Mouillière (white), and the pink Vicomtesse Vibray; while Verbena Miss Wilmott, Salvia Glory of Zurich, and Antirrhinum Nelrose were exhibited in good form. Among the ferns were Platycerium Willinckii, Polypodium Mayii, Davallia effusa, and the graceful D. fijiensis robusta.

A unique collection of sweetly scented Pelargoniums was exhibited by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett). Standards of Shrubland Pet, Mrs. Meredith, Scarlet Unique, Prince of Orange, and Shelton Unique were shown to perfection, while the groundwork consisted of many varieties, amongst which were the rare crispum variegata, Godfrey's Bride, tomentosum, and quercifolium giganteum.

The outstanding feature of the exhibit from Messrs. H. CANNELL AND SONS was the central mound of Pelargonium Galilee of a delightful shade of pink, and surrounded by fine specimens of the white Hydrangea Mme. Mouillère. Rega Pelargoniums were shown in variety, and the front of the exhibit was composed of hybrid Saxifragas, Phlox subulata G. F. Wilson, Gentiana acaulis, and the erect and stately Myosotis Blue Gem, Pink Gem, and White Gem.

Dwarf hybrids of Schizanthus in many colours were shown by Mr. ALFRED DAWKINS, the centre of the group being occupied with the richly-coloured Calceolaria Buttercup, which gained an Award of Merit last year. An excellent batch of Calceolarias, ranging in colour from yellow to deep bronze, was staged by the St. George's Nursery Co.

A varied collection of greenhouse flowering plants was brought by Messrs. STUART, LOW AND Co. The mauve Hydrangea Mme. Mouillière and silvery-leaved Leucophyton Brownii, Epacris miniata superba, scarlet, tipped with white, Chorezema Lowii, orange with red lip, and Grevillea alpina, scarlet, were among the choicest things.

Messrs WEBB AND SONS staged large towering mounds of their Stellata and superb strains of Cinerarias, while at the sides were similar mounds of compact hybrid Schizanthus and superb Calceolarias, the intervening spaces between the mounds being occupied by Adiantums, Caladiums, Gloxinias and Begonias.

A. P. BRANDT, Esq., Bletchingley Castle, Surrey, staged an attractive circular group of Crotons. The richly-coloured foliage of Edmontoniensis was very pleasing, and other good things were the yellow Golden Bracelet, the broad-leaved Comte, Lady Helland, Queen Victoria and Golden Chain.

Begonias were staged in delightful style by Messrs. BLACKMORE AND LANGDON; the flowers were of magnificent colour and form and included such varieties as Lady Tweedmouth, rose pink tinged with salmon and delicately crinkled petals; Lord Methuen, scarlet; Mrs. J. S. Brunton, a flower of good form; Irene Tabling, orange; and Mrs. W. Cuthbertson, a beautiful flower.

Messrs. JARMAN AND Co. exhibited bunches of richly coloured zonal Pelargoniums, Auriculas, Violas, and the fine white Stock Jarman's Giant White Brompton, with large double flowers.

A large group of Calceolaria Clibranii came from R. L. MOND, Esq., Coombe Bank, near Sevenoaks. The plants were well grown, and at one end an unnamed bronze-flowered variety was exhibited.

From Messrs KER AND SONS came a collection of Hippeastrums, for which this firm is famous. Rosy Queen, Moonlight (white); Salmon Queen, Orange Prince and Pink Queen were most attractive and fresh in spite of their long journey.

Sweet Peas.

Messrs. DOBBIE AND Co. displayed Sweet Peas in a very attractive manner. Among the newer introductions were Majestic (a delightful shade of cream), Royal Scot (flame), Pink Pearl, Mrs. Hitchcock (cream pink), Mrs. T. Jones (mauve), Dobbie's Maroon and Old Rose (a charming variety). Illumination, Dora, and Jean Ireland were other varieties which attracted attention. Sweet Peas were also shown by Mr. J. STEVENSON, who staged his flowers with artistic skill. Epergnes of Italia (mauve), Brilliant (salmon cerise), and La France (pink) were arranged at the back, and other varieties of note were Red Ensign, Scarlet Glow, Splendour (maroon), Hope (rose), and Golden Glory (salmon).

A very effective group of Sweet Peas was exhibited by Messrs. ALEX. DICKSON AND SONS, the four varieties shown being Hawlmark Pink, which received an Award of Merit; Brocade (rose pink; Hawlmark Maroon, and Daisybush, silvery pink. These varieties were grouped in large masses and against the background of black velvet they showed up to perfection.

Carnations and Pinks.

Carnations were shown in excellent condition by Mr. C. ENGELMANN... The group was artistically arranged, a large column of flowers occupying a central position, while placed at regular intervals were splendid vases of blooms; beneath these was a ground work of Carnations, slightly raised towards the centre. The principal varietes shown were Scarlet Carola, White Wonder, Saffron (a fine deep yellow flower), Iona (salmon red), Lady Northcliffe (pink), Delice (pale pink), Snowstorm (white), Coquette (mauve), and Carola (deep red). Messrs W. CUTBUSH AND SON also displayed a neat, circular group of flowers. There were good baskets of White Wonder, Circe (mauve), Sunstar (yellow), and Mrs. C. F. Raphael, below which were R. F. Felton (pink), Triumph (deep red), Lady Ingestre (salmon pink) and White Swan.

Messrs. STUART, LOW AND Co. staged a large collection of Carnations. Malmaisons were represented by the delicate pink Hugh Low, Mrs. Myles Kennedy, rose pink; Mephisto, mottled orange and scarlet; and the Hon. Charlotte Knollys, deep salmon pink. Of the perpetual flowering varieties, British Triumph, Eileen, a rich salmon pink, Scarlet Carola and Red Ensign were employed with excellent effect.

Messrs. ALLWOOD BROS. staged Carnations in admirable style and arranged them in a circular group, in tiers. The overhanging baskets were occupied with Mayday and the large artistic vases with Mary Allwood, Wivelsfield White, Mrs. C. W. Ward, Mikado, and Triumph. The new Wivelsfield Beauty, an apricot-coloured flower, was greatly admired. From the same firm came the new hardy garden Pink Allwoodii Harold, a prolific double white-flowering form.

Hardy Pinks, bred from the old florist's laced varieties, were shown by Mr. C. H. HERBERT, Queen Mary (pink with dark centre), Dickey Falton (cherry-pink with carmine centre), Victoria (deep scarlet), and May Queen (pink) being very fine.

The Hon. JOHN H. WARD, K.C.V.O., Chilton, Hungerford, staged some exceptionally beautiful vases of Lady Allington (pink), Lady Lathom (deep red), Baroness de Brienen (silvery pink), and Nikko (scarlet) Carnations. From C. A. CAIN, Esq., The Node, Welwyn, came a semi-circular group of Carnations, amongst which were good plants of Baroness de Brienen, White Wonder, Triumph, and Scarlet Carola.

Some exceptionally fine hardy border Carnations were staged by Mr. JAMES DOUGLAS. The new Cleopatra (vieux rose), which gained an Award of Merit; Surrey Clove (deep scarlet); Glamour (a good yellow); Effie Deans (salmon); and Veldfire (scarlet) were well shown and in the front was arranged a fine collection of Auriculas.

A gracefully-arranged exhibit of Carnations came from Messrs. KEITH LUXFORD AND Co. The flowers were of fine quality and colour, the épergnes of Triumph, Aviator, Rosette, Coquette, Beacon, and Mrs. C. W. Ward attracting attention.

Rhododendrons and Azaleas.

MESSRS. JOHN WATERER, SONS & CRISP, LTD., Bagshot, Surrey, staged two beautiful groups of Rhododendrons. The pink-flowered variety, Alice, was represented by numerous specimens, and other varieties of note were Prometheus (dark red), Cynthia (deep pink), the popular Pink Pearl and Gomer Waterer, with delicate white and pink tinged flowers.

A gorgeously coloured collection of hardy Azaleas interspersed with purple-leaved Acers was shown by Messrs. R. and G. CUTHBERT. Azalea Apple Blossom, a Mollis-sinensis hybrid with pink-mauve flowers, was perfect, while other varieties of note were Alphonse Levallee (orange), Dr. Leon Vignes (creamy yellow), Pucella (pink), Sunset (orange pink) and [illegible] de Quincey (bright yellow). It was fine to see these glorious plants again, and so well shown.

A rectangular group of Rhododendrons was contributed by Messrs. FLETCHER BROS, the pick of the varieties including Cynthia (pink) Doncaster (scarlet), Purity (white), Mrs. Thistleton Dyer, rose; John Waterer (red), The Bride (white); and Sappho (white, blotched with reddish brown).

Stove Plants.

An exhibit of stove plants was contributed by Messrs. L. R. RUSSELL, Richmond. Among the rarer things were the pretty pink-flowered Medinella magnifica, Croton Juliet Russell and Dracaena Victoria. Delicately-coloured Bertolonias and Anaectochilus setaceus were exhibited under bell-glasses, and Caladiums in variety, Tillandsia Zanii, Ananassa sativa variegata, and the yellow Richardia Elliotiana were included.

An attractive group of Caladiums came from Messrs. JOHN PEED & SON, who staged varieties ranging from greenish yellow to deep rose pink. Of the many specimens shown the varieties John Peed (dark), Mad. J. Box (pink), King of the Yellows, Sir Julian Goldsmith (light), and King George were particularly outstanding.

Hardy Shrubs.

A very interesting and rare collection of shrubs was brought by the DONARD NURSERY Co., the specimens being well grown. An unflowered plant of Rhododendron discolor, which is one of the last to bloom, was shown, and other fine things of merit were the fern-leaved Lomatia pinnatifolia, Eucryphia cordifolia, Tricuspidaria lanceolata, the scarce Fagus Cunninghamii. Andromeda formosa, with graceful spikes of white flowers and pleasing foliage, the reddish pink leaved Acer sanguinea Chisho, and a well-flowered specimen of Grevillea rosmarinifolia. The feature of the exhibit from Messrs. R. C. NOTCUTT was the standards of Cytisus Beani (yellow), C. Dallimorei (rose-purple), C. kewensis (cream and of a drooping habit); C. Andreanus, and C. praecox alba were also represented. The new Pyrus Malus Zunii, with pure white flowers, and a collection of Japanese Azaleas ranging in colour from scarlet to white were included with standard lilacs.

Mr. G. REUTHE showed a collection of hardy flowering shrubs and alpines. Among the former were Rhododendron campylocarpum (yellow); R. kewense (white, tinged pink); the large-leaved R. Falconeri (white); R. yunnanense; together with Enkianthus campanulatus, Cytisus alba rosea, the new Menziesia multiflora major, and Erica arborea alpina.

The YOKOHAMA NURSERY Co. showed a large collection of miniature gardens and old Japanese trees. Among the latter were some very fine aged specimens of Pinus Massoniana, Thuya obtusa (100 years old), and Larix leptolepsis.

Messrs. J. CHEAL AND SONS, LTD. staged a beautiful semi-circular group of hardy flowering shrubs, the centre being occupied with some very fine standard specimens of Wistaria chinensis, Viburnum plicatum (a mass of white flowers), standard specimens of Cytisus Andreanus, the star-flowered Olearia Gunniana, the pink Cerasus James H. Veitch, and the pretty Rubus deliciosus. Richly coloured Acers and Azaleas were also freely used, and among the former A. dissectum purpureum, A. japonicum laciniatum, and A. versicolor were noted.

At the end of one tent Messrs. J. PIPER AND SONS exhibited Chinese shrubs in quantity, and the mass of the pretty foliaged Ilex Pernyi was much admired. Other good things were Osmanthus ilicifolius purpureus, Juniperus pachyphloea, Pittosporum Silver Queen, with foliage edged with white, and the silver Senecio Grayi. Combined with these were masses of white and pink Hydrangeas, and circular mounds of Spiraea Pink Pearl.

E. J. P. MAJOR, Esq., St. Tudy, R.S.O., Corn

wall, brought a very interesting collection of Rhododendrons, amongst which were R. campylocarpum R. bullatum and R. lepido—Boothi, a hybrid between R. lepidotum and R. Boothi which gained an Award of Merit.

Messrs. W. H. ROGERS AND SON, LTD., showed Embothrium coccineum (scarlet); Vaccinium Mortenia (white, tinged pink); Juniperus communis compressa, a dwarf and slow growing conifer; and the small leaved Ledum thymifolium.

Hardy Flowers.

Messrs. BARR AND SONS exhibited a ground group of Irises and other plants in the form of a star. Pleasing varieties of Irises were the new Souvenir de Zurnenburg, King Christian, the dwarf Eclipse, and Ditton Purple; named varieties of large-flowered Trollius and a batch of Cypripedium Calceolus were also included. Mr. G. REUTHE was responsible for a group of alpines and other hardy flowers, including the new Menziesia multiflora major, with pretty pendulous flowers. Messrs. B. LADHAMS showed a good collection of hardy flowers, including Violas and Primulas in variety, and Camassia Fraseri Dipella speciosa, and Thalictrum aquilegifolium roseum.

Meconopsis integrifolia was seen in beautiful condition in the exhibit from Mr. J. C. ALLGROVE, as were also the giant Rheum purpureum, the double-flowered Papaver orientale florea plena, the stately Eremurus himalaicus, and Viburnum Davidii, a thick-leaved species with white flowers and reddish-brown stamens. Good pots of the yellow Primula tangutica, the mauve P. sibirica chinensis, and the white Phlox nivalis were included, amongst other choice things, in the group.

Messrs. REAMSBOTTOM AND CO. showed their very fine strain of St. Brigid Anemones in excellent form and in many shades of colour. The decorative effect to be obtained from these flowers is difficult to surpass; moreover, they remain fresh in the cut state for a week.

From Messrs. J. CHEAL AND SONS came a few plants and vases of the new Star Dahlias, and these were accompanied by a collection of rock plants, of which the varieties of Phlox subulata were particularly bright.

Primula Red Hugh, Phlox pilosa, Trollius napellifolius, Dicentra formosa, and a good batch of the Polyanthus Codsall strain were seen in the exhibit from Messrs. BAKERS'; and Messrs. JOHN FORBES, LTD., showed named varieties of East Lothian Stocks, Saxifragas, and Auriculas.

Mr. REGINALD PRICHARD brought a collection of Alpines in pots, Edaianthus Pumilio, Gentiana verna, Phlox Vivid and P. Nelsonii and Globularia alba being particularly noteworthy.

A display of Alpines also came from WM. CUTBUSH AND SON, who showed Horminum pyrenaicum (purple), Dryas octopetala (white), Saxifraga lingulata (fine spikes of white flowers) and the beautiful Veronica Hulkeana in good form.

Messrs. G. G. WHITELEGG AND CO. staged a collection of Saxifragas, Phlox and Aubrietias, among other things, and from Mr. AMOS PERRY came the quaint Orontium aquaticum, Thermopsis caroliniana (yellow), Polemonium confertum millitum (cream yellow), Camassia Liechtlinii (lavender), Primula Wardii (mauve with white eye), and Lewisia Howelli. Menyanthes trifoliata and Aponogeton distachyum were shown in a small pool of water in the centre of the exhibit.

Messrs. JOHN WATERER, SONS, AND CRISP, LTD., staged a collection of alpines on a table. Hybrids of Dodecatheon Meadia were shown, together with bright masses of Linum arboreum (yellow); Ajuga genevensis (blue), Daphne caucasica (white), and the dwarf Morisia hypogaea (yellow). Mr. G. W. MILLAR brought named varieties of Violas, Daisies, Heucheras, Trollius, and hybrid Saxifragas, while from Mrs. LLOYD EDWARDS came a well arranged group of hybrid Saxifragas, and the beautiful Anemone alpina grandiflora. Of the Saxifragas, Red Dwarf, which gained an Award of Merit, together with the variety J. C. Lloyd Edwards, a bright rose flower with greenish-yellow eye, were very attractive, as also was the large flowered Myosotis Roll of Honour.

Miss WILLMOTT, V.M.H., Warley Place, sent Paeonia Mlaxosowitschii, with yellow flowers, and the charming white P. Willmottiana, which gained a First-Class Certificate.

Mr. W. R. DYKES showed Iris Turkoman (a hybrid between I. Korolkowii × I. stolonifera) and I. Hoogiana, a charming flower. Both of these gained an Award of Merit.

Alpine Plants.

A neat exhibit of alpines came from Messrs. BEES, LTD., and among the most attractive flowers were Primula Beesiana, P. Watti, the new trifolium uniflorum, Geum Borisii (orange-scarlet), Corydalis Flame, the beautiful Roscoea cautiliodes and Oxalis adenophylla. Clemisia spectabilis argentea, with large white flowers and silvery foliage, and the pink Aetheonema Warley Hybrid were also worthy of mention. Mr. Maurice Prichard exhibited a good collection of herbaceous plants and alpines. The outstanding plants were Erigeron Bertram Gentle (mauve-rose), Dianthus neglectus Russell V. Prichard (a fine, large pink flower with deep centre), Primula La Lorraine and P. Aileen Aroon, a pulverulenta hybrid with coppery-bronze flowers, and Polygonum divaricatum, a herbaceous plant growing about two feet high, with spikes of creamy flowers closely resembling a Spiraea.

Alpines, set among rock work, were exhibited by Messrs. KENT AND BRYDON, who displayed Anemone narcissiflora, Primula involucrata, P. Wardii, Polemonium replans, and the large-flowered Saxifraga Arkwrighti in good form. Messrs. J. PIPER AND SON also contributed a pleasing group, the plants being set out in bold masses. Chieranthus Allionii provided a rich orange-yellow colour, and other good things were Ramondia pyrenaica rosea, Dianthus Napoleon III. (scarlet), D. Atkinsonii (scarlet), Androsace Chumbyi (rose), Pentstemon Scoulerii (lavender), Saxifraga paradoxa (white), and the richly-coloured forms of Lychnis Arkwrightii.

Trees and Shrubs: Outdoor Exhibits.

There were not quite so many or such extensive collections of hardy trees and shrubs in the open as in 1914 or the two previous years, but when compared with 1916, for instance, the present year wins. Messrs. W. FROMOW AND SONS had two very large displays of Japanese Maples in surprising variety. All possible leaf forms and colourings were represented. The pale greens of standard Acer palmatidum, the delicate tracery of its variety palmatifidum, the rich deep colour of Acer p. sanguineum variegation and the delicate colouring of Acer p. corallinum were all equally enchanting. To the uninitiated it was astonishing that so very many distinct types of leafage and such varied colourings could be produced in the two species which were so grandly represented.

Japanese Maples played an important part in the praiseworthy groups of Shrubs set out by Mr. G. R. RUSSELL, and he also made full use of the valuable background which was provided by the trees and shrubs of the hospital gardens, so that on approaching Mr. Russell's exhibit one had the impression of a couple of very large established beds of choice shrubs in some old country garden. The group of Kalmia Katifolia in full bloom charmed many visitors who were previously unacquainted with these bluish pink saucer-shaped flowers, and the more observant discovered an added interest in the disposal of the stamens, while the fortunate ones were delighted with the mechanical jerk when the filaments broke loose, as it were, in their journey centrewards to the stigma. Profusely-flowered little bushes of Azalea amvera varieties gave rich colour and stateliness was added by the perfectly-pruned "Empress Crown" Bays at the end of the grass walk.

FIG. 129. ROCK AND WATER GARDEN, EXHIBITED BY MESSRS. R. WALLACE AND CO.
(See p. 262.)

No particular style of arrangement was aimed at in the supplementary group of hardy trees which Messrs. WATERER, SONS AND CRISP set out near by, but the very many interesting forms of topiary were well worth the attention it received. Uncommon species for this work was Ilex crenata, Cupressus filifera aurea, Cupressus obtusa densa, and Retinospara tetragona, in a very slender pillar topped with its golden variety. These were all fascinating, and provided welcome variety to the more formal topiary. Several examples of drooping Holly (Ilex aquifolium pendulum) in particularly vigorous condition were also much admired.

Mr. JOHN KLINKERT arranged with skill a very wide range of the perfectly-trained topiary examples for which he has become so well known. These were chiefly in box, all dense specimens full of health and even vigour. By Mr. Klinkert's system of culture his specimens may be moved at any time of the year, so there

was not the least suspicion of flagging or drooping foliage.

Rock and Formal Gardens.

The slope by the Embankment is an excellent position for rock gardens, and here Messrs. R. W. WALLACE AND Co. showed their skill most admirably. The essential boulders were placed splendidly, and it was a natural transition from the hillside rockery, along the little mountain stream, past green slopes to the pools below. All the structural portion was, of course, in miniature, but it was a generously-sized model of alpine scenery; dwarf Conifers, perfectly proportioned, added to the illusion. Of the many other shrubs, the host of dwarf Alpines which entered into the scheme, space does not permit mention, but it may be said that all were appropriate for the purpose; all were in just the right place, and they furnished the quantities of bloom that is essential in a spring garden.

Messrs. J. PIPER AND SONS also had a garden that charmed hosts of visitors. Banks of large trees and shrubs, planted with taste and skill, a running brook broadening into an ample pond, crossed by firm stepping stones and linked up by paved walks, invited many visitors on a tour of discovery, where they found just the right plants for water gardening. Further on well planted little alpine gardens arrested their steps and demanded inspection. An old Japanese stone lantern planted around with glaucous-green Funkias was a particularly happy effect.

Messrs. G. G. WHITELEGG AND Co. contented themselves with a conventional rock garden, and it was quite a successful effort. The boulders were well disposed, the pool was proportionate, and the planting was done with knowledge and taste. The massed deep blue Jentians, Pink Beauty Saxifragas, billowy white Iberis, and Saxifraga Arkwrightii were all particularly attractive.

In the rock garden built up by Mr. CLARENCE ELLIOTT, very many seasonable and appropriate alpines were set out with sympathetic knowledge so that it formed a very harmonious whole. Dainty little blue Forget-me-nots, rosy-purple Aubrietias were all much admired, and many visitors were enchanted with the tiny Irish Juniper.

The Misses HOPKINS must have spent a deal of time and labour on their adjoining rock garden, which was intersected with green slopes and filled with a delightful variety of suitable plants.

Messrs. PULHAM AND SONS were allotted large space, and they made splendid use of it. The dominant feature was a spacious formal garden. A well designed and substantially built pergola divided the broad lawns, and led the way to a restful garden house of pleasing design. Paved walks and steps, and the enclosing pale golden hedges were also done excellently well. By the side of this large formal garden was a fine rockery, also of quite large size. The placing of the boulders would certainly have satisfied the geologist, while the planting found the approval of the horticulturist.

Mr. H. JONES brought up a large quantity of his well-known paving and made a formal garden which would satisfy the most critical; the low walls and balustrading were particularly successful. Floral effect was not arrived at, but there was a sufficiency of shrubs and plants to indicate the possibilities of this exhibit.

Mr. HERBERT BROOK was, in part, the victim of circumstances. His scheme provided for the inclusion of tubs and pots of various appropriate subjects. These were lost or delayed on the wayside—or, more probably, railway siding—but the essential flagstones came along in good time, so Mr. Brook was able to show how well his stones are adapted for the making of formal gardens.

Mr. J. WOOD, Boston Spa, designed and arranged a very interesting rock garden in which the naturally weathered Yorkshire stone was a distinct feature, and among the stones were planted charming groups of Saxifragas, Aubrietias, Alpine Phloxes and a large number of other dwarf Alpines, which are in their full bloom at this season of the year, and all of which harmonised with the rock setting.

Fruit and Vegetable Committee.

Present.—Mr. C. G. A. Nix (in the Chair), and Messrs. A. E. Vidler, W. Bates, J. Whytock, F. Jordan, E. Harriss, J. Elkeston, A. R. Allan, J. C. Allgrove, A. W. Metcalfe, W. H Divers, A. H. Pearson, G. F. Tinley, H. S. Rivers, W. Pope, J. Basham, and G. P. Berry.

The only exhibit before the Committee was a new variety of Rhubarb, named Hancock's Early Crimson Grooveless. It was shown by Mr. T. Hancock, 38, Leamington Street, Mansfield, and was certainly remarkable, some of the petioles weighing about 2 lbs., without the leaves. The exhibitor will be asked to send plants to Wisley, for trial and comparison in growth.

FIG. 130.—VEGETABLES EXHIBITED BY MESSRS. SUTTON AND SONS.

Fruits and Vegetables.

Only two exhibitors entered this section, which the visitor must have considered somewhat neglected in view of the importance of food production, but it is consoling to know that while fruit and vegetables were few at the show there are ample supplies in our gardens.

The collection of fruit was from the gardens of the Hon. JOHN WARD, C.V.O., Chilton, Hungerford, and it reflected the greatest credit on Mr. Charles Beckett, his gardener, for this exhibit was of great merit. There were many bunches of Foster's Seedling, and Black Hamburgh Grape, ripe and well finished; handsome, fragrant Melons, Best of All, Ringleader, and a seedling; black-red Cardinal Nectarines; Brown Turkey Figs, shown in plenty, and even more unusual at this season were the dishes of Victoria Gooseberries and the White Currants.

Messrs. SUTTON AND SONS were the exhibitors of vegetables, and it need scarcely be said that this contribution was as near perfection as is humanly possible. Green Peas, just fit for the kitchen, were the most prominent feature, and these were displayed as pot plants and gathered pods arranged on stands. The chief varieties were Duchess of York, Duke of Albany, Sutton's Pioneer, World's Record, and Little Marvel. French Beans were equally good, even though not shown in such quantity as the Peas. Many red Tomatos of perfect shape added brightness as well as value. Harbinger Cabbages and other early sorts, firm-hearted and of succulent appearance, milk-white Broccoli Latest of All, and such saladings as Lettuce, Cucumbers, and Radishes all helped to make a magnificent display.

Science and Education.

In the long marquee which linked up the floral exhibits with the lecture tent, there was a great deal to claim and hold the attention of the more serious cultivator and garden lover. As was fitting the R.H.S. filled the largest space and placed on view numerous diagrams and examples. Charts, similar to those which have been used by the Society's many lecturers during the past season, illustrating the best methods of performing garden operations and showing a surprising number of injurious insects and their ravages, were methodically laid out. Insect pests received full attention, for in addition to the diagrams there were many excellent specimens with the individual insects' fell work. These well illustrated the troubles and trials which the cultivator finds waiting for him and, as Mr. C. G. A. Nix remarked at the Press meeting on Monday, show the urgent need of anticipating the depredations of insects and losses by diseases, by timely sprayings. Manuring, which was also emphasised by the Society's Treasurer, was likewise a subject of illustration.

Most interesting was the selection of spray nozzles and full set of diagrams showing the space covered by the sprays when used at uniform distance and pressure. Examples of Daffodil and Tulip diseases which are harassing growers, were well, too well from the cultivators' point of view, shown. Samples of various Beans, illustrating comparative yields and models of germination of various subjects were all excellent.

From the Keighley Museum were sent specimens of many plant galls, and the Nature Study Union had a wide range of specimens, showing trees in leaf and flower, birds and animals.

Horticultural Sundries.

Fertilisers and Insecticides.—The ACME CHEMICAL Co., LTD. made a very attractive display with their Acme Weed Killer, Lime Sulphur Wash, Arsenate of Lead, and other preparations; while in addition to making a good show of tins of similar mixtures, manures, and spraying appliances, the BOUNDARY CHEMICAL COMPANY hung up excellent diagrams illustrating very many of the insects which so harass the cultivator. The well-known V.2. and V.2.K. spray fluids occupied a prominent place on the attractive stand of Messrs. WM. COOPER AND NEPHEWS, who also set out spraying machines. Messrs. CORRY AND Co., LTD. had a splendid show of their well-known insecticides and fungicides which, in view of the increasing need for spraying so many crops, attracted much interested attention. Dry sprays were displayed by Mr. J. L. EDGINGTON, whose preparations are known as Limbux, Pestibux, and Bordobux, and, near-by the FOUR OAKS MACHINE Co. had many spraying machines and watering-cans of well-known design. The equally popular HOLDER HARRIDEN spraying machines were on show, as were also the world-famous JEYES' Sanitary Compounds, which are so valuable for garden use, as well as for public places. "Rito" fertiliser in various quantities, as well as photographs showing the splendid results from the use of this plant food, were the object of much attention. Messrs. PRENTICE BROS. contributed their Tomonite and other fertilisers and lawn sand.

The MOND NICKEL Co. had a splendid position amongst the formal gardens. There the attendants demonstrated the mixing and use of "Blighty," the newest specific for Potato blight. Gishurstine and Gishurst compound have long been

known and appreciated by generations of gardeners, and these with Quassia compounds were present as reminders of their value. In the Lime Avenue, Messrs. G. AND W. PURSER had spraying appliances, hose and fittings; and Mr. J. SINGLETON demonstrated his Nuespray for watering purposes; while the STONEHOUSE WORKS Co. showed plenty of knapsack and other sprayers with various preparations.

Messrs. WALTER VOSS AND Co. are well-known makers of spray fluids and appliances, and their best was on show. The UNITED BRASS FOUNDERS AND ENGINEERS Co. had sprayers; and Mr. T. H. WEBSTER showed his Cascade nozzle.

The famous "Abol" brand of spraying appliances, non-poisonous insecticides, and effective weed killers were contributed by Messrs. E. A. WHITE, LTD.; and sprayers, cultivators and garden implements were placed on view by Messrs. WM. WOOD AND SON.

Garden Furniture.—This section was well represented, so there were numerous garden seats, tables, chairs and tents to choose from. Mr. G. BLAY had entrance gates and fencing; seats of many kinds were set out by the CASTLES' SHIP-BREAKING Co., the DRYAD CANE AND METAL WORKS Co., Messrs. GAMAGE AND Co., Messrs. HUGHES, BOLCKOW, AND Co., the LEYTON TIMBER Co., and Messrs. B. MAGGS AND Co., who also had tents.

Varied selections of statuary and vases were present from Messrs. T. CROWTHER AND SON, who also had charming gates and lead figures. Messrs. LIBERTY AND Co. made the most of their exhibit, which was in the form of a Japanese garden. Messrs. PIGGOTT BROS., Messrs. PULHAM AND SON, Messrs. SANDERS AND Co., and Mr. T. WEST CARNIE all had interesting exhibits.

Horticultural buildings of good design and workmanship were erected by Messrs. BOULTON AND PAUL, showing that this firm has progressed even during the recent unfavourable time; Messrs. W. DARLINGTON AND SONS had a new motor pump. A wire tension greenhouse, full-sized, was erected by Messrs. SKINNER, BOARD, AND Co.; and lastly, but not least, Messrs. J. WEEKS AND Co. arranged examples of their boilers, sun-blinds, and a model greenhouse.

The ACME PATENT LADDER Co. showed examples of their specialities. Messrs. DREW, CLARK AND Co. had extension ladders. Mr A. B. JOHNSTON displayed turves of yellow loam, perfect for cultivating most terrestrial plants; and the HOUSE AND GARDEN SUNDRIES Co. demonstrated the use of their novel seed sower. Good metal labels were shown by Mr. JOHN PINCHES and many artists displayed pictures of charming gardens.

AWARDS TO GROUPS.

Coronation Cup.—To Messrs. ARMSTRONG AND BROWN, Tunbridge Wells, for Orchids.

"Daily Graphic" Cup.—To Messrs. R. WALLACE AND Co., Colchester, for rock garden.

Gold Medals.—To Messrs. ARMSTRONG AND BROWN, Tunbridge Wells, for Orchids; CHARLESWORTH AND Co., Hayward's Heath, for Orchids; Sir JEREMIAH COLMAN, Bart. (gr. Mr. Collier), Gatton Park, Reigate, for Orchids; Messrs. J. and A. McBEAN, Cooksbridge, for Orchids; Messrs. FROMOW AND SONS, Chiswick, for Japanese Maples; Mr. HERBERT JONES, for Formal Garden; Messrs. R. TUCKER AND SONS, Oxford, for Rock Garden; Messrs. PULHAM AND SON, Oxford Street, for Formal Garden; Messrs. R. WALLACE AND Co., Colchester, for Rock Garden; Mr. J. WOOD, Boston Spa, for Rock Garden; Messrs. ALLWOOD BROS., Wivelsfield, Hayward's Heath, for Carnations; Messrs. BARR AND SONS, Covent Garden, for Tulips; Messrs. JAS. CARTER AND Co., Raynes Park, for Greenhouse Plants; Messrs. ALEX. DICKSON AND SONS, Newtownards, for Sweet Peas; Messrs. DOBBIE AND Co., Edinburgh, for Sweet Peas; Mr. C. ENGELMANN, Saffron Walden, for Carnations; Messrs. KER AND SONS, Liverpool, for Hippeastrums; Mr. R. C. NOTCUTT, Ipswich, for Cytisus and other flowering shrubs; Messrs. PAUL AND SON, Cheshunt, for Roses; Messrs. WM. PAUL AND SON, Waltham Crosss, for Roses; Messrs. JOHN PEED AND SONS, West Norwood, for Caladiums; the Hon. JOHN WARD, Chilton, for Fruits; Messrs. SUTTON AND SONS, Reading, for Vegetables; Messrs. J. WATERER, SONS AND CRISP, Bagshot, for Rhododendrons; Messrs. WEBB AND SONS, Stourbridge, for Greenhouse Plants; R. BUTTERFIELD, Esq., for exhibit of British galls; Mr. J. K. RAMSBOTTOM, Kew, for exhibit illustrating the investigation of Eelworm Disease in Daffodils; and the School of Nature Study Union, for nature studies.

Silver Gilt Flora Medals.—To Messrs. JAS. CYPHER AND SONS, Cheltenham, for Orchids; Messrs. FLORY AND BLACK, Slough, for Orchids; Messrs. STUART, LOW AND Co., Enfield, for Orchids; Messrs. MANSELL AND HATCHER, Rawdon, for Orchids; PANTIA RALLI, Esq., Leatherhead, for Orchids; Mr. CLARENCE ELLIOTT, Stevenage, for Rock Garden; Mr. L. R. RUSSELL, Richmond, for Trees and Shrubs; Messrs. J. WATERER, SONS AND CRISP, Bagshot, for Trees and Topiary; Messrs. R. H. BATH, LTD., Wisbech, for Tulips; Messrs. BEES, LTD., Liverpool, for Hardy Plants; Messrs. BLACKMORE AND LANGDON, Bath, for Begonias; Messrs. B. R. CANT AND SONS, Colchester, for Roses; Messrs. R. and G. CUTHBERT, Southgate, for Azaleas; Messrs. DOBBIE AND Co., Edinburgh, for Tulips; the Donard Nursery Co., Newcastle, Co. Down, for New and Rare Shrubs; the Hon VICARY GIBBS (gr. Mr. E. Beckett), Aldenham House, Elstree, for Pelargoniums; Mr. ELISHA J. HICKS, Twyford, for Roses; Messrs. STUART, LOW AND Co., Enfield, for Carnations; Mr. E. J. P. MAGOR, St. Tudy, Cornwall, for Rhododendrons; Mr. AMOS PERRY, Enfield, for Hardy Plants; Mr. J. STEVENSON, Wimborne, for Sweet Peas; Messrs. J. WATERER, SONS AND CRISP, for Herbaceous Plants.

Silver - Gilt Banksian Medals. — Mr. J. KLINKERT, Richmond, for Topiary; Messrs. J. PIPER AND SONS, Bayswater, for Formal Garden and Topiary; Messrs. PULHAM AND SON, Oxford Street, for Rock Garden; A. P. BRANDT, Esq. (gr. J. W. Barks), Bletchingly Castle, Surrey, for Crotons; C. A. CAIN, Esq. (gr. Mr. Pateman), The Node Gardens, Welwyn, for Malmaison Carnations; Messrs. J. CHEAL AND SONS, Crawley, for Trees and Shrubs; Messrs. ALEX. DICKSON AND SONS, Newtownards, for Tulips; Mr. JAS. DOUGLAS, Great Bookham, for Carnations; Messrs. FLETCHER BROS., Chertsey, for Rhododendrons; Messrs. HOGG AND ROBERTSON, Dublin, for Tulips; Messrs. B. LODHAMS, LTD., Shirley, Southampton, for Hardy Plants; Mr. G. W. MILLER, Wisbech, for Hardy Plants; R. L. MOND, Esq. (gr. Mr. C. Hall), Coombe Bank, Sevenoaks, for Calceolarias; Mr. MAURICE PRICHARD, Christchurch, for Hardy Plants; Mr. L. R. RUSSELL, Richmond, for Stove Plants; Messrs. SUTTON AND SONS, Reading, for Tulips; Mr. CHAS. TURNER, Slough, for Lilacs; Messrs. R. WALLACE AND Co., Colchester, for Tulips; YOKOHAMA NURSERY Co., Kingsway, for Japanese dwarfed trees.

Silver Flora Medals.—To Mr. H. DIXON, Wandsworth, for Orchids; Messrs. G. G. WHITELEGGE AND Co., Chislehurst, for Rock Garden; Mr. E. DIXON, Putney, for Formal Garden; Mr. J. C. ALLGROVE, Slough, for Hardy Plants; Messrs. BAKERS, Wolverhampton, for Hardy Plants; Messrs. BARR AND SONS, Covent Garden, for Irises; Messrs. H. CANNELL AND SONS, Swanley, for Hardy Plants; Messrs. WM. CUTBUSH AND SON, Highgate, for Alpines; Mr. A. DAWKINS, King's Road, S.W., for Schizanthus; Mrs. LLOYD EDWARDS, Llangollen, for Saxifragas; Messrs. HOBBIES, LTD., for Roses; Messrs. STUART, LOW AND Co., Enfield, for Greenhouse Plants; Messrs. J. PIPER AND SONS, Bayswater, for Chinese Plants; Mr. R. PRICHARD, Wimborne, for Alpines; Messrs. J. PIPER AND SONS, Bayswater, for Alpines; Mr. G. REUTHE, Keston, for Flowering Shrubs; the Hon. JOHN WARD, Chilton, for Carnations.

Silver Banksian Medals.—To the Misses HOPKINS, Shepperton, for Rock Garden; Messrs. ALLWOOD BROS., Haywards Heath, for new Dianthuses; Messrs. J. CHEAL AND SONS, Crawley, for Hardy Plants; Messrs. WM. CUTBUSH AND SONS, Highgate, for Roses, and also for Carnations; Mr C. H. HERBERT, Birmingham, for Perpetual Pinks; Messrs. JARMON AND Co., Chard, for Pelargoniums and Sweet Sultans; Messrs. KENT AND BRYDON, Darlington, for Alpines; Messrs. K. LUXFORD AND Co., Harlow, for Carnations; Mr. G. W. MILLER, Wisbech, for Alpines; Mr. CHAS. TURNER, Slough for Roses; Messrs. REAMSBOTTOM AND Co., Geashill, King's County, for Anemones; Messrs. ROGERS AND SON, Southampton, for Alpines; Messrs. J. WATERER, SONS, AND CRISP, for Alpines; and Mr. GEORGE PRINCE, Longworth, for Roses.

Bronze Banksian Medals.—To Mr. HERBERT BROOK, Valley Road, S.W., for Formal Garden; Mr. J. MACDONALD, Harpenden, for Grasses.

Certificate of Appreciation.—To Miss E. P. Brennand, for water-colour studies of Rhododendrons, etc.; W. DYKES, Esq., Charterhouse, for work in raising Irises; E. P. MAGOR, Esq., St. Tudy, Cornwall, for new Rhododendrons.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MAY 13.—*Present*: Mr. E. A. Bowles, M.A. (in the Chair), Sir George Watt, Messrs. J. W. Odell, W. Hales, E. M. Holmes, and F. J. Chittenden (hon. sec.).

Certificate of Appreciation.—A Certificate of Appreciation was unanimously recommended, at the instance of the Orchid Committee, to Messrs. McBean, of Cooksbridge, for work done in raising the interesting hybrid Odontoglossum × Eugenia. This plant is the result of crossing O. cordatum and O. crispum. Its flowers are nearest to O. crispum, but the segments are narrowed by the influence of O. cordatum, the dull red blotching of which is also shown. The labellum has undergone a curious change, its form being broadly ovate, the acuminate apex of the cordate labellum of O. cordatum being suppressed, the only evidence of it being seen in a short, thread-like apiculus on the underside of the front of the lip.

Fasciated Saxifrage.—A fasciated stem of Saxifraga hypnoides was sent by Mr. Britton, of Cuckfield. The stem was fully half an inch in width, and bore numerous rather small flowers.

Hybrid Buddleia.—Mr. Van de Weyer sent a specimen of the hybrid Buddleia globosa × B. madagascariensis, which he had raised in his garden at Corfe Castle. While B. madagascariensis is only half hardy at Corfe Castle, the hybrid is growing outdoors and flowers earlier than B. globosa. It has no scent (as in B. madagascariensis), the leaves of which it has also inherited, there being none of the tawny down on the leaves as there is in B. globosa, but in the manner of flowering it has followed B. globosa, though the flowers are, on the whole, paler, and the balls of flowers rather larger.

HORTICULTURAL CLUB.

MAY 20.—The annual dinner of the members of the Horticultural Club was held on the first day of the Chelsea Show at Anderton's Hotel, Fleet Street, E.C. The President, Lord Lambourne, occupied the chair, and amongst those present were Sir Harry Veitch, H. Morgan Veitch, Dr. Rendle, G. Monro, Jun., H. B. May, C. Harman Payne, Alfred Watkins, J. F. McLeod, Edward White, C. Bouckenooghe, George Paul, W. Cuthbertson, J. Hudson, W. B. Cranfield, H. S. Rivers, P. C. M. Veitch, A. Turner, A. White, E. Laxton, Captain A. Hill, Rev. J. Jacob, G. H. Barr, P. R. Barr, J. W. Barr, G. H. C. Bard, J. Collingridge, J. C. Brunton, R. Pinches, J. B. Walker, and G. F. Tinley, Hon. Secretary. Altogether eighty-four, including many ladies, were present. The tables were attractively decorated with flowers and fruits kindly given by Messrs. G. Monro and Co., whilst Mr. A. Watkins sent lovely spikes of Lily of the Valley and large Parrot Tulips. After dinner the musical programme was rendered by Mr. Turle Lee and his company, the entertainment being exceedingly good.

Sir Harry Veitch, in addressing the new President, referred to the great loss the club had sustained in the death of Sir Frank Crisp, but he

congratulated the members on Lord Lambourne's consent to fill the vacancy, and thanked him for being present in the chair that evening. Lord Lambourne, in a humorous speech, thanked Sir Harry Veitch for his kind remarks, and stated that quite recently he had two signal honours conferred upon him, one that of being asked to be President of the Royal Horticultural Society, and the other to fulfil a similar office in the Horticultural Club. At a later stage Lord Lambourne congratulated the Club, and proposed the health of the Secretary, Mr. G. F. Tinley, to whom they owed a pleasant and enjoyable evening.

TRADE NOTES.

WE regret to learn that Mr. John Seymour died at his residence in Old Sleaford on Tuesday, the 6th inst after a long and painful illness. Had he lived until the 28th of July next he would have completed his 78th year.

He was a Lincolnshire man, born at Hainton, where his father, who lived to the age of 92 years, was gardener to Mr. Heneage, father of the present Lord Heneage. After leaving school he was for some years under his father in the extensive gardens, and then took up a responsible position with Sir Brandeth Gibbs, the well-known horticulturist and seedsman, of Half Moon Street, Piccadilly. After some years in Half Moon Street he decided to return to his native county, and in 1880 came to the late Mr. Charles Sharpe, to whom, and to Messrs. Charles Sharpe and Co., Ltd., he rendered 35 years' continuous service up to his retirement, owing to ill health, in 1915, when the firm signally marked its appreciation of his long and valued services.

WART DISEASE OF POTATOS.

THE Board of Agriculture is prepared to arrange for the inspection of crops of Potatos of varieties immune from wart disease on application in writing from growers in England and Wales in districts regarded by the Board as suitable for the production of "seed." This arrangement will apply only to growers whose area under any one variety is not less than half an acre. Where, after inspection, the Board is satisfied that the stock is pure and the general condition of the crop satisfactory, a certificate to that effect will be issued to the grower. The object of the inspection is to secure so far as possible that pure "seed" true to type shall be available for planting in 1920 in areas certified as infected areas under the Wart Disease of Potatos Order of 1918. It must be remembered that under this Order "seed" of immune varieties can be sold only to dealers or under licence. The Board is not prepared to issue a licence until there is evidence that the stock is pure and the general condition of the crop satisfactory. The possession of a certificate will assist the grower to sell his "seed" to a dealer, and will facilitate the issue of licences for sale to individual growers. Applications for the inspection of growing crops must be made on forms provided for the purpose, which can be obtained from the Board of Agriculture and Fisheries, Commercial Division, 72, Victoria Street, London, S.W.1.

Answers to Correspondents.

BLUEBOTTLES IN A VINERY: *J. McL.* The flies may be largely prevented from entering the house by stretching hexagon wasp-proof netting over the ventilators and other apertures. The few flies that enter by the door may be trapped with bottles containing syrup in solution or sweetened beer. The hexagon netting may be obtained from horticultural sundriesmen.

DIOSPYROS LOTUS (DATE PLUM).: *G. G.* The tree is dioecious; therefore male and female specimens should be planted within a reasonable distance of one another, in order that the fruits may form. The male flowers are produced one to three together in the axils of the leaves, but the female flowers are produced singly. The fruits attain to a size of ½ to ¾ inch in diameter. They become orange coloured at maturity, but remain harsh or astringent and unfit for eating. In this country, at least, the trees are only of ornamental value.

Erratum: Trifolium uniflorum, which received the Award of Merit on the 13th inst. (see page 244), was shown by Mr. W. Wells, Junr., Hardy Plant Nurseries, Merstham, Surrey, and not by Messrs. Wells and Co., as stated by our reporter.

ERYTHRONIUM DENS-CANIS: *J. T.* Without seeing the conditions in which your plant is growing we are unable to arrive at the cause of its failure to flower. The species usually succeeds in rich light soil in a partly shaded situation, flowering freely when established. If your specimen is growing in a very shady place move it to where it will get more sunlight. This can be done any time after the foliage dies down. These bulbous plants often like to grow and come up between other low growing perennials of loose habit.

ESTABLISHING LICHENS ON SLATES AND FLINT BUILDINGS: *A. Y.* Lichens have been reproduced artificially on a small scale, but it was done by scientific men for scientific purposes. In order to reproduce or establish them on smooth surfaces like relatively new slates or flints it would be necessary to make the surfaces rough to prevent the rain and snow from washing away the spores or young plants. Possibly thin cement splashed on the slates and flints on a dry day would answer the purpose, and they could be dusted with powdered lichens while still wet. These lichens would have to be crustaceous or foliaceous ones, which grow naturally upon slates, tiles, rocks or stones. They could be scraped off with a knife. It would be necessary also to find fruiting ones, if possible. The fruiting parts or apothecia in Parmelia, for instance, are like tiny saucers or round shields, and coloured differently from the rest of the plant. The more distinct they are the more advanced the spores would be. It would be necessary to get spores in all probability, because tiny green Algae accompany them, and both fungus and Alga are necessary to make a lichen. You will have to trust to the maturity of the fruits, and sow powdered pieces of the whole plant.

EUCRYPHIA PINNATIFOLIA: *G.* This plant is a handsome shrub, attaining to a height of 3 to 8 feet on the outskirts of London, and even in the county of London itself, where it proves quite hardy and flowers every year. It should prove hardy in the milder western side of Gloucestershire. Young bushes thrive best planted in a peaty soil, with the ground shaded by dwarf shrubs growing around it till they attain some considerable size and shade the ground with their own evergreen foliage. The flowers are like single Roses or large white Hypericums with a great brush of stamens in the centre.

FIGS NOT MATURING: *W. B.* The fruit you send is affected with spot disease, caused by a fungus—Cercospora Bolleana. Collect and burn all diseased leaves and fruits. Badly diseased trees are difficult to cure and are best rooted up and burned, and fresh stock planted in clean soil. In the case of trees that are only lightly affected, it is found that a weak solution of Bordeaux mixture is helpful in checking the spread of the fungus.

NAMES OF PLANTS: *A. F. R.* (1) Berberis stenophylla. (2) Pieris (Andromeda) floribunda. (3) Kerria japonica flora plena

PEACH LEAVES UNHEALTHY: *W. J.* Examination of the leaves when first received showed no fungus present, and the injury suggested "scorching" by water or atmospheric conditions. Cladosporium and other saprophytic or weakly-parasitic fungi developed in culture, but it is impossible to say whether any were the primary cause.

SCALDED VINE LEAVES: *H. T.* Scalding is chiefly due to the scorching effect of bright sunshine acting through globules of water on the foliage—the water acting as a burning glass. Commence to ventilate the vinery very early in the morning, and if the temperature can be maintained allow a little ventilation all night, so that the excess of moisture on the leaves may be dispersed before the sunshine is bright enough to scorch the foliage. There was a suggestion of mildew on one leaf, so sulphur should be kept at hand to prevent the spread of this disease.

VICTORY BEDDING SCHEMES: *A. H.* If it is desired to use Pelargonium Paul Crampel in the schemes, this variety should be planted in the centre of the bed, the second line of lines being filled in with a white bedding Pelargonium such as Snowdrop, and the whole edged with blue Lobelia. Plants with real blue flower are very scarce. If the beds are of considerable size and any edging other than the Lobelia is required, dwarf white Alyssum could be used. Another bed might be planted with a few dot plants of Chrysanthemum frutescens var. Mrs. F. Sander, under-planting with Pelargonium Paul Crampel, and surrounding the whole with blue and white Lobelia, or, in place of Lobelias, blue and white Ageratum might be used. If you do not favour a white flowering subject with the scarlet Pelargonium, a foliage plant, such as Centaurea candidissima, could be used, its silvery-white foliage having all the effect of a white flower; as an edging, the soft blue of Ageratum associates well with the silvery foliage. Verbenas are very useful summer bedding plants, and may be had in scarlet, blue, and white. Again, the scarlet Pelargonium could be surrounded with a broad band of white Antirrhinums of the intermediate type, edging the whole with a broad band of Delphinium "Blue Butterfly." Another good subject for edging is the dwarf Nemesias Blue and White Gem; they both come true from seed and last in flower for a long time. Lobelia cardinalis var. "Queen Victoria" could be used for the centre of a bed, and surrounded with a white Antirrhinum, edging the whole with any of the blue subjects already mentioned. Scarlet and white East Lothian Stocks, edged with blue, would also make a good bed, which would continue in flower to the end of the season.

WORK ON HERBACEOUS BORDERS: *Miss E.* Two men should trench the amount of border you give in two or three days, the time depending on the character of the soil, and the price suggested is ample. As the soil seems naturally fertile, the amount of farm-yard manure suggested should be sufficient with the addition of concentrated fertilisers, which should be applied during the growing season. The amount of animal manure suggested is far too much for the area of ground; four loads should be ample, especially as you state that the growth of the plants is very strong. Apply the basic slag, at the rate of 4 oz. per square yard, during November; sprinkle it on the surface, not in contact with the dung, and lightly fork it in the soil before replanting. If lime is used instead of basic slag it should not be applied with the manure, but should be sprinkled on the surface and, like basic slag, lightly forked in before planting. The failure of some subjects to flower well is probably due to the fact that the plants require dividing. Many hardy herbaceous plants require to be divided and replanted after a season or two, and when this is done the strongest outer portions of the clump should be selected for replanting. Paeonies are impatient of disturbance, and generally require a season to get re-established after transplanting.

MARKETS.

COVENT GARDEN, May 21.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

REMARKS.—Warmer weather and plenty of brilliant sunshine, have increased the supplies of Carnations, Roses, Tulips, Narcissus Poeticus, and Sweet Peas. Narcissus—Double White is also plentiful this week, consignments of these flowers arriving from the Channel Islands, Cornwall, and the first arrival from the Spalding district started this morning. Gypsophila elegans, Iceland Poppies and Double White stocks are fairly well supplied by home growers. The Bride (white) is added to the list of Gladioli available Iris are getting more prominent and lower in price. There are abundant supplies of Lilium candidum. Richardeas (Arums), are of inferior quality and smaller in quantity owing to the warm weather. A few blooms of Lilium longiflorum were sold last week at 1s. 6d. per bloom. A few buhnches of Blue Cornflowers were offered for sale this morning. Violets are quite finished and are being replaced by the useful Viola cornuta.

REMARKS.—English Hot-house Fruits now on offer consist of the following:—Grapes, Muscat of Alexandria and Black Hamburgh; Peaches, Melons, Figs and Strawberries. The shipment of Tasmanian Apples referred to in the last issue is overdue. The supplies of green Gooseberries are increasing daily. The following forced vegetables are obtainable: Tomatos, Marrows, Beans, Peas, Mushrooms, Cucumbers and new Potatos. Asparagus is now plentiful, the bulk coming from the Worcester district. Outdoor vegetables in all seasonable kinds are fairly plentiful.

SCHEDULES RECEIVED.

Croydon Horticultural Society's Flower Show, to be held in the Park Hill Recreation Ground on Wednesday, June 25, 1919. and the Vegetable and Fruit Show to be held in the Public Halls, George Street, Croydon, on Saturday, July 19, 1919. Secretary: Mr. L. R. Welstead, 11, Addiscombe Court Road, Croydon.

Royal Botanical and Horticultural Society of Manchester and the Northern Counties Flower Show, to be held in Platt Fields, Rusholme, Manchester, on July 24, 25, and 26, 1919. Secretary: Mr. P. Weathers, Botanical Gardens, Old Trafford, Manchester.

The Annual Floral Meeting of the National Dahlia Society, to be held on September 9, 1919, in the London Scottish Drill Hall, Buckingham Gate, Victoria Street, S.W. Hon. Secretary: Mr. Jas. B. Riding, Forest Side, Chingford, London, E.4.

Messrs. JOHN WATERER, SONS & CRISP, L^TD.

Beg to inform their numerous customers that they are not holding their large exhibition of Rhododendrons in London this season owing to the difficulties of labour and transport, but they anticipate having one of the finest shows of Rhododendrons and other flowering shrubs that have been seen in their Nurseries at Bagshot for many years. These will be in their full beauty from now onwards for another three weeks.

The Nurseries are easily reached from London by rail direct from Waterloo to Bagshot station, from which they are half a mile distant, or by motor, the Nurseries are some 26 miles from Hyde Park Corner on the main road.

At the Twyford Nurseries, which are situated on the main Bath road 1½ miles from Twyford station, we have grand collections of Alpine and Herbaceous plants, Roses, Fruit Trees, and many hundreds of thousands of May flowering Tulips. These will be in their full beauty the coming week. We cordially invite inspection of both Nurseries, and feel confident that visitors will find much to interest them in the many new and beautiful plants that we grow.

JOHN WATERER, SONS & CRISP, LIMITED,

DICKSON & ROBINSON'S GREENHOUSE CALCEOLARIA.

This is a STRAIN of exceptional vigour, size, beauty and colouring. We claim for it there is not one finer in commerce. The "slippers" are very large and of great substance. They are most beautifully spotted and blotched, and the colours are quite remarkable in their richness, beauty and variation In the profession of gardening it has long had great vogue. We have cause to know that among amateurs the splendid qualities of this STRAIN have engendered more than ordinary enthusiasm in the culture of this fine greenhouse decorative plant.

SEED 1s 6d., 2s. 6d. and 3s. 6d. PER PACKET.

THE FASCINATION OF ORCHID GROWING.

THE principal charm in the cultivation of Orchids lies in the great variety of the flowers they produce, for in no other class of plants are to be found blooms of such varied shape, size and colour.

Orchid growing, or Orchid possessing, is a hobby in which I venture to think fewer beginners educate themselves than in any other hobby which can be named.

When a person sets out to make a collection of any kind he generally commences by making mistakes, yet a collector of, say, old porcelain, pictures, or postage stamps educates himself very early in his collecting period, with the object of avoiding mistakes which may prove expensive.

To experience the fascination of Orchid growing from the commencement the start must be a correct one. I would not advise anyone to commence with a "general" collection, even if the plants are chosen to suit the temperature of a single house. It would be preferable to start with one family at a time, and the members of it should be chosen either by a friend with full knowledge of the subject, or supplied by one of the well-known nurserymen, who may be relied upon to render faithful assistance to the man who wishes to form a collection. If plants are bought irrespective of temperature and without knowledge, the same disappointments will be experienced as I had in my early collecting days, and as many another has had as a result of over-confidence or pride.

A friend of mine, having a few Orchids under the care of a general gardener, occasionally attended sales. How he, with his lack of knowledge, dared to buy imported plants I do not know, but I saw him purchase imported Cattleyas at one of these sales. He was informed by an interested stranger that these Cattleyas were infested with the Cattleya fly. He had no idea what this meant, therefore it did not deter him, and he merely replied, "Never mind, they will soon fly away," and continued his purchases. The result was that all the plants had to be destroyed. I have very little sympathy with such an obstinate attitude, but such a catastrophe would probably result in the loss to Orchid culture of a possible enthusiast, and certainly would be a great hardship to his gardener. This is an extreme case, but how many of us have been guilty of buying, at sales, half-dead plants with high-sounding names, because the price was low compared with that of a healthy plant purchased from a nurseryman, and then expected our grower to flower it?

It does not, however, follow that at sales all plants are obtainable at low prices. My experience is that Orchids of

FIG. 131.—PYRACANTHA GIBBSII VAR. YUNNANENSIS.
(One-third natural size: see p. 266.)

lower values bring more at private sales than they could be purchased for from the trade.

The whole system of educating oneself upon any subject lies in benefiting by the experiences of others, by avoiding their mistakes, and by using their methods as a foundation for improvement.

My experience is not exactly a "Pilgrim's Progress," but "sloughs" have been passed through which with more knowledge might easily have been avoided. The desired haven is always something in the far distance. Some aims are not achieved, but the encouragements far outweigh the disappointments.

The nucleus of my collection was formed some twenty-five years ago. My collector was Mrs. Thwaites. She "collected" from her father's Orchid houses —a few at a time. The plants consisted of what I may term "beginner's" Orchids, viz., Coelogyne cristata, Dendrobium nobile, and a few Cypripediums. It may be too much to say that these plants will grow anywhere, but with a small amount of attention, and just a little ordinary care, they will bloom freely year after year. The initial cost of such plants may not be more than that of good Rose bushes, but there is much more joy in the flowering of one Orchid than in many Roses.

The comparative ease with which the Orchids named are grown should induce the owner after a time to add similarly easily grown plants to his collection, but here again he may soon be on the wrong track. It was at this stage that I attended a private sale and bought all the rubbish no one else would have, such as Cyrtopodiums, Oncidium lanceanum, Pleiones, and Masdevallias (the names of which were Greek to me), simply because there were no other bidders.

A little later on, as I found that I could grow Coelogyne cristata, I bought the "alba" variety for £20 at a sale room. On getting this plant home I took it out of the pot, washed it thoroughly clean in running water under a tap, divided it, potted it in peat and Sphagnum-moss, and killed it. I have found since that Coelogyne cristata objects to this kind of treatment.

I now began to realise that I was buying my experience too dearly; in fact such experience was of no use to me at any price. It was positive experience I required, and not the negative kind. I am thankful that at this time I had no grower to blame except myself, and I tender my sincere sympathy to any gardener whose employer expects him to grow and flower indiscriminately chosen plants, bought by him at sales.

I now purchased Mr. Burberry's book on Orchids, a short, concise, and very helpful guide, and at about the same time I made the acquaintance of Mr. H. J. Chapman (the well-known grower to Mrs. Norman Cookson), who then had charge of the late Mr. Measures' fine collection. From Mr. Chapman I received encouragement to persevere, and frequently visited the collection then under his charge at Camberwell. I began to realise that the "growing" of Orchids must never cease to be a subject of study if any pleasure was to be derived from it. By conversations with growers, at the sale rooms and exhibitions, and by visiting a few private collections, I learnt to know and understand something of the requirements of Orchids. I found that they needed to be grown in their own special temperature, and to be carefully studied as to shading and watering. Also I found that Odontoglossums cannot be successfully grown in a Phalaenopsis house. Presently I built more houses for Orchids, and took up the growing of Dendrobiums as a speciality. From that time until the present, the growing of Orchids has never ceased to be a fascinating hobby to me. The Dendrobiums grew successfully, and I commenced to purchase the rarer varieties. Fertilisation and the raising of seedlings were studied, and when these matters are successfully dealt with there can be no doubt as to the large amount of enjoyment there comes from growing Orchids.

About this time I was fortunate in securing the services of Mr. J. M. Black (now a partner in the firm of Messrs. Flory and Black, of Slough) as grower. One of the first hybrids raised at Ches-

sington, was Dendrobium Thwaitesiae (D. Wiganiae xanthochilum × D. splendidissimum), which, when shown before the Royal Horticultural Society, was given an Award of Merit by the Orchid Committee, while one of our finest results we consider to be Brasso-Laelio-Cattleya The Baroness, that beautiful, golden-yellow hybrid, which was obtained from Laelio-Cattleya Ophir, and Brasso-Cattleya Leemaniae, both of which were raised at Chessington.

It is an outstanding fact that Orchid growers, both amateur and professional, are always ready to help the beginner, and encourage him to better things, and a novice should attend exhibitions and converse with those who are expert, and thus gain a great deal of helpful information.

At a little later period white Orchids were much in demand, and we at Chessington began to study seriously the possibility of obtaining them from seed. Our first success was the result of "selfing" Dendrobium nobile virginale. All the plants raised from this parent proved true to name when they flowered. We then tried crossing Cattleya labiata Amesiana (white, with a mauve lip) with C. labiata R. I. Measures (white, with coloured lip) in the hope of raising plants which would give white flowers with coloured lips. The result was exceedingly disappointing, for all the plants had very pale mauve on the sepals, petals and lips of their flowers.

Large numbers of experiments were tried with other plants, following upon various theories formed as to the origin of white Orchids, the results making it quite clear that many reputedly "white" Orchids were, in actual fact, not white. We did, however, succeed in raising white Orchids, true, from pure white parents, and from parents having yellow flowers on the one hand and purple flowers on the other we have obtained many having pure white sepals and petals.

There are always problems for the hybridist to solve, which will keep up his interest. If anyone is particularly keen on "solutions," let him try his hand with Dendrobium Brymerianum as a parent.

The problem of storing pollen from one plant's season of flowering to that of another gave us much thought, but the difficulty has been very largely overcome. The difficulty of fertilising the small flower of Sophronitis grandiflora with pollen from large Brasso-Cattleya flowers was successfully solved by dividing the pollen masses of the large flower. The successful fertilisation of Cochlioda Noezliana was discovered through finding out that the flower possesses a divided stigma instead of the usual single surface.

Discoveries are always being made—the following is rather wide of my subject, but the reference to Brasso-Cattleyas tempts me to include it as a "discovery." A lad working in my houses, coming across a label marked B.-C. Leemaniae, said to my grower, "My word! here's an old one." He had mistaken "B. C." for a datal reference; perhaps "Julius Cæsar—55 B.C." had been so thoroughly drilled into him, that B.-C. could not possibly have any other meaning than that which related to the birth of the plant.

Provided one sets to work intelligently, the growing of Orchids, from the flowering of the first plant purchased to the latest production of the hybridist, will prove a most fascinating pursuit. *R. G. Thwaites, Streatham.*

NEW OR NOTEWORTHY PLANTS.

A NEW VARIETY OF PYRACANTHA GIBBSII.

AT the time I published the description of the Chinese Pyracantha Gibbsii* I was unaware that a closely allied form had been in cultivation for some years under the name of P. crenulata var. yunnanensis Mottet. I made its acquaintance in the Crataegus collection at Kew, where there is a specimen 6 feet high which came from Messrs. Chenault's nursery at Orleans in 1913. This Thorn resembles P. crenulata var. Rogersiana in its widely-spreading branches, but is more robust in habit and the foliage is quite different. From P. Gibbsii, however, it can hardly be separated except by its somewhat more spiny branches and obovate or oblong-spathulate leaves, which are distinctly and often coarsely crenate or even lobulate. The leaves of P. Gibbsii are generally obovate-oblong or elliptic in outline and entire or finely serrate in the upper two-thirds. The fruits appear to mature much later than in P. Gibbsii, lasting at any rate this year until the middle of March, the fruits of P. Gibbsii, having disappeared some weeks previously. This latter character, however, requires testing over a number of seasons. On looking up the original description of P. crenulata var. yunnanensis in *Revue Horticole* for May, 1913, a copy of which was kindly

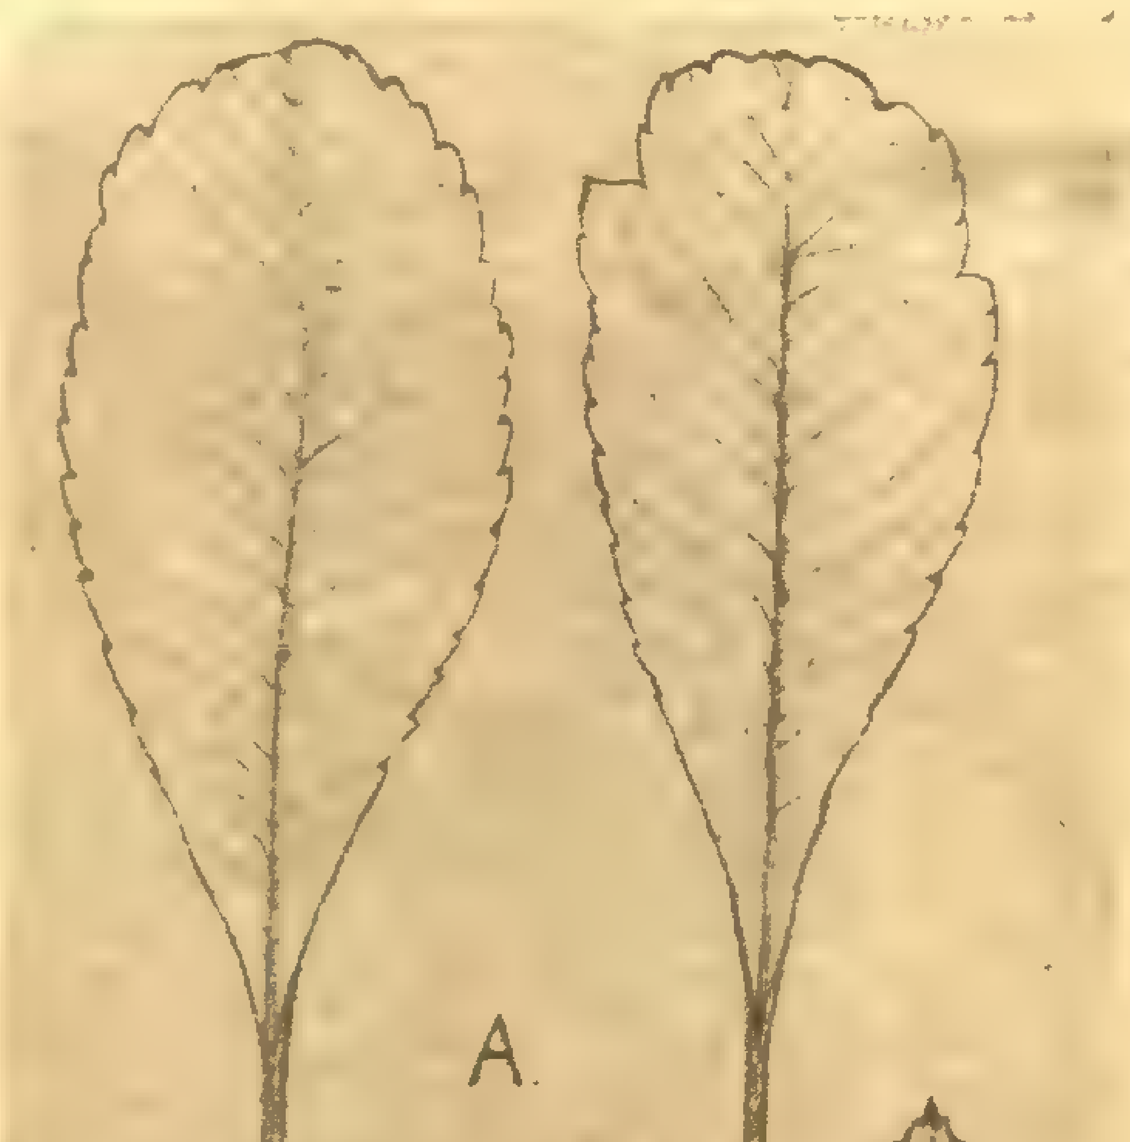

FIG. 132.—A, LEAVES OF P. GIBBSII VAR. YUNNANENSIS, NAT. SIZE; B, LEAVES OF P. GIBBSII VAR. TYPICA, NAT. SIZE.

sent me by Messrs. Chenault, I find that its introduction dates from 1906, when seeds collected in Yunnan by R. P. Ducloux were distributed by the late Maurice de Vilmorin under number 5012. In the British Museum Herbarium there is a plant with very similar foliage (No. 10625), collected at Mengtaze, Yunnan, by Henry, and specimens collected by Wilson in Western Hupeh and Western Szechuan (Nos. 2984 and 2985) also belong here. According to Mottet, it differs from the Himalayan P. crenulata by its more vigorous habit, longer spines and larger leaves, which are elliptic lanceolate in outline 5 to 8 cm. long, obtuse, and finely denticulate The flowers are white instead of rose-coloured, as in the Himalayan plant, the fruits being slightly smaller on shorter pedicels and of a much more vivid coral red, and last well into January. Mottet's plate shows very effectively the decorative character of the fruiting plant, but the leaves are represented as spathulate in shape with crenate margins, just like the plant named yunnanensis at Kew, and not elliptic lanceolate as described above. I have often seen elliptic lanceolate leaves on plants of P. Gibbsii, however, the foliage of individual plants showing great variation in this respect. This difference in leaf form is well shown in Mr. Spooner's drawing (Fig. 132 A. and B.). Wild specimens of Pyracantha preserved in herbaria exhibit the same degree of variation as regard foliage, hardly any two specimens appearing to be alike, so that one could hardly expect cultivated plants to be otherwise. M. Mottet has since written to inform me that the plant at Kew is identical with the one he described as P. crenulata var. yunnanensis, and was in fact received from M. Chenault's nursery about the same time. He took his description from the specimen figured, the leaves on that plant being much smaller than on those now grown. He would emend his original description and call the leaves spathulate. I see no grounds, however, for uniting this Chinese Pyracantha with the Indian P. crenulata, as Mottet has done. The latter seems to be a shrub entirely different in habit and constitution. Sir Fredk. Moore has sent me from Glasnevin specimens from four different plants of P. Gibbsii which differ considerably in foliage and size of fruit. No. 1 of these, labelled P. crenulata (Wilson 662), with elliptic oblong entire leaves and fruits about 7 mm. in diameter, is P. Gibbsii var. typica, and is in cultivation at Kew under that name. No. 2, labelled P. crenulata yunnanense, has elliptic-lanceolate leaves which are more or less distinctly crenate, and large scarlet fruits like those of P. coccinea up to 9 mm. in diameter, is also P. Gibbsii var. typica. No. 3, labelled P. Gibbsii, has broader leaves, ovate to oblong in shape, entire or crenate in margin, and fruits like No. 1. No. 4, labelled P. crenulata obtusata, has obovate or spathulate leaves, coarsely crenate in margin, but with much smaller fruits about 5 mm. in diameter; this is the same as the Kew yunnanensis, and, to avoid confusion, should be called P. Gibbsii var. yunnanensis. I have also seen specimens of this variety from Warley Place, Essex, and Nymans, Sussex, and it will, no doubt, be found in cultivation elsewhere. Forms intermediate between it and var. typica probably occur. The description and synonymy of the plants under discussion will therefore stand as follows:—

Pyracantha Gibbsii var. typica.

P. crenulata Wils. Pl. Wils. ii. 177 (1912) (non Roxb.) pro parte.

Leaves obovate-oblong or elliptic lanceolate in outline, entire, obscurely or finely serrate in margin, often mucronate.

Pyracantha Gibbsii var. yunnanensis Osborn in *The Garden*, 1919, p. 138.

P. crenulata var. yunnanensis Mottet (emend), *Rev. Hort.*, 1913, p. 204, with Fig.

P. crenulata Wils, op. cit. pro parte.

P. crenulata var. obtusata, Hort, Newry.

Leaves obovate or oblong-spathulate, coarsely crenate or occasionally lobulate.

A. Bruce Jackson.

CONFESSIONS OF A NOVICE.

THE present year will be memorable to me beyond all years by reason of the fact that I have re-discovered the beauty of spring. During the long years of war the seasons made their tedious procession before eyes which were straining always to see the future, and were averted from the present; but this year the present has become real and welcome again, and the eyes of those who care for the beauties of nature are delighted to discover how much more beautiful the reality of spring is than the mere remembrance. How much this is due to the fact that the present bright sunshine has enhanced the

colours of spring flowers and how much it is a subjective psychological phenomenon, I neither know nor care; but this I know, that never has the countryside been so beautiful as it is at this moment. The evanescence of the blossom of individual plants makes no difference, for although the double Cherry by my window only remained in blossom for a few days, its place in the pageant was taken by the flowers of the Crab Apples, which in turn are now shedding their petals like snow flakes and making a white carpet on the paths. The blue of the spotted-leaved Polemonium has only just faded, but already the Lithospermum of yet more heavenly blue has fallen like a piece of sky in the rock garden. Were it not that there is no room for regret in a thankful heart, I should sorrow at the manifest fact that the Lithospermum is flowering for the last time. It is in truth a poor perennial with me, and after several years of floriferousness and neglect it is making a last brave and successful effort. The brilliant weather following on the bad early spring has resulted in a kind of peace conference of flowers—kinds which had never met before are now conferring with one another to make the garden world brighter than ever before. The earlier and later Saxifrages are blossoming together, and with them Phlox subulata, Anchusa myosotidiflora, Tiarella cordifolia, Chrysogonum, Cheiranthus Allionii, and, of course, the Aubrietias, which, for some reason not apparent, are exceptionally fine and persistent this year. So also the fruit garden bids fair to associate plenty with peace, and to atone for the disappointing leanness of last year. In spite of the blizzard, the Plums have set well, and what is even more surprising, Peach and Nectarine on an east wall do not seem to have been affected by that bitter experience. Apples and Pears promise fine crops, but I am regretting now with bitterness that they were not sprayed with arsenate of lead, for caterpillars are sunning upon them and it is unpleasant and uncongenial work to attempt to check them by the rule of thumb method rather than by a poison ground bait. However, my gardener is no great believer in spraying holding, I think, that "a certain number of fleas is good for a dog," and so I spend my evenings in trying to reduce their numbers. Small fruit also promises extremely well, Gooseberries in particular and, indeed, so far as I can learn there is no trace of mildew to be discovered anywhere. This is a blessing to the grower, but a misfortune to the person of inquiring mind. I, for example, should have liked to have an opportunity of trying the effect of Prof. Salmon's ammonium sulphide as a specific against American Gooseberry mildew. It is, I believe, now on the market, and is said to have less scorching effect on the more delicate varieties than has lime sulphur. However, I am well content to forgo the trial of the fungicide on condition that I am spared the outbreak of the disease. All the omens point to a great extension of gardening—similar, perhaps, to that which occurred in this country at the close of the Napoleonic wars. May it be so, for there is no saner nor more exquisite pleasure than that which may be had by novice and adept alike from the cultivation of a garden: in it every success is a triumph, and every failure an entertainment. *A. N.*

PLANT NOTES.

MALVASTRUM HYPOMADARUM.

THIS pretty greenhouse plant (see Fig. 133) although it has probably been in cultivation in this country for over a century—seems to be still an uncommon plant in gardens. It has been known under various names, such as Malva capensis, Malvastrum capensis, M. capensis, M. virgatum, and M. grossulariaefolium.

It is easily propagated by means of cuttings during May or June, and if young plants are stopped several times during the growing season they make compact specimens, which flower freely in the following April. The flowers are about an inch across, the petals white, with a rosy-red blotch at the base. The whole plant has a light and elegant appearance, and remains in flower for several weeks.

Although effective as a pot plant, Malvastrum hypomadarum is seen at its best when planted out and trained up a pillar or back wall of a greenhouse, and the writer remembers a specimen some twelve feet high trained up the wall of the plant corridor in the Royal Botanic Gardens, Edinburgh. In this position it was very effective, the whole plant from top to bottom being covered with a profusion of flowers.

M. hypomadarum is a native of South Africa, and grows well in an ordinary greenhouse temperature, potted in the usual potting compost, consisting of good medium loam with the addition of a little leaf soil and sand. *J. C.*

[Malvastrum hypomadarum was fully described in *Gard. Chron.* of June 20, 1908, pp. 394 and 395.—EDS.]

FIG. 133.—MALVASTRUM HYPOMADARUM, FLOWERING IN A WARM GREENHOUSE AT KEW.

LETTERS FROM SOLDIER GARDENERS.

A VISIT TO M. LORETTE'S GARDEN.

IN view of the publication in the current issue of the journal of the Royal Horticultural Society of a paper by Dr. Durham and of his articles which appeared in *Gard. Chron.* during the autumn of 1914, describing a system of pruning fruit trees which has been devised by Professor Louis Lorette, the following notes may be of interest.

I visited Wagnonville, near Douai, on the afternoon of May 3rd and was very kindly received by M. Lorette. He told me that during the war he had been allowed by the Germans to continue his work on the fruit trees after the preliminary evacuation of the inhabitants of the district, on the condition that he did not touch any of the fruit or vegetables grown in his garden. He suffered no abnormal interference from the Germans, who, as I saw, had erected one of the familiar "Verboten" notices on the gate. When the complete evacuation of civilians from the area was carried out in September, 1918, M. Lorette and his family were removed through Belgium and Holland, and were eventually repatriated via Dieppe in January, 1919.

During his absence the school was lightly shelled and one of the main buildings burnt. A number of trained fruit trees on its walls perished. A shell had destroyed a winged-pyramid Pear tree and several other trees had suffered slight damage from fragments. On the whole the garden has been remarkably fortunate in escaping with so little damage, but all books and a large mass of valuable correspondence, together with all the furniture of M. Lorette's house, were looted during his absence.

The trained fruit trees, now almost in full blossom, are most eloquent advocates of "Taille Lorette." I was amazed at the regularity of the trees; at the great number, even spacing and compactness of the fruit spurs; by the absence of unfurnished wood; and at the enormous production of flower-clusters.

Owing to the late hour of my arrival I was able to take only a hurried walk round the garden, and the failing light made photography impossible, so M. Lorrette asked me to come back next morning. I returned at an early hour and found that M. Lorette had been at work very early and had already done a lot of clearing up.

M. Lorette took great pains to explain the whole system and made clear several points in Dr. Durham's paper which were not understood by me. He emphasised the necessity of allowing 40 centimetres as a minimum space between the branches of any form of fruit tree. He considers that the double U is by far the most desirable form of cordon tree.

I gratefully acknowledge the extreme courtesy and kindness which M. Lorette extended to me in demonstrating the principles of the system which he has founded on acute observation and scientific knowledge of a very high order.

That M. Lorette should have carried on his work at all under the iron rule of the invader in a zone of actual operations, with his premises always occupied by troops, and with no assistance than that of his daughters, is remarkable. It is a manifestation of the spirit of his countrymen, which has carried their country through the trials of the last four and a half years, and proof of the devotion, energy and indomitable perseverance of a very great gardener. *C. C. T.*

CLIVIA MINIATA.

IMANTOPHYLLUM is the name most generally used by gardeners, but Clivia is the correct name for one of the most useful of all exotics for the decoration of greenhouses and conservatories, and for the dwelling house during the spring. Clivia miniata is the commonest species and is robust growing, with leaves of a deep lustrous green, the flowers being produced in umbels on the summit of a stout scape. The genus constitutes a very handsome race of plants and the improvements that have been effected in them by selection and hybridisation is extraordinary. In some of the varieties of Clivia miniata the classes, where they seemed to be equally at home and equally appreciated. In years gone by several Belgian nurserymen devoted much time and trouble to the improvement of these plants, and had brought them to a high state of perfection, both in size and colour. Among English nurserymen the late Messrs. B. S. Williams and Son and Mr. John Laing raised several fine varieties. The late firm of Messrs. James Veitch and Sons were fortunate in raising some beautiful varieties with large trusses, varying in shades from bright orange-scarlet to light orange-yellow, the result of crossing C. miniata with the yellow C. citrina, a recent introduction from the Cape.

FIG. 134.—FLOWERS OF MALVASTRUM HYPOMADARUM: FLOWERS WHITE WITH ROSY RED BLOTCHES. (See p. 267.)

trusses are larger, more symmetrical and denser than those of the type. The individual flower also is larger and of finer form, whilst the colour is brighter and more refined in every respect. Several of these beautiful varieties, including Baroness Schröder, citrina, concinna, Scarlet Gem, and F. E. Arnold, have received awards from the Royal Horticultural Society. Before the war visitors to Belgium in the spring were much impressed with the many beautiful plants of Clivia in flower, not only in the homes of the rich and those who take a strong interest in the advancement of horticulture, but also in the windows of the working

Clivias make excellent plants for placing on terraces or where large specimen pot plants may be employed to advantage.

The plants are easy of culture, and should be grown in a temperature of 45° to 55°, with a rather moist atmosphere during their season of active growth after flowering is over, and kept moderately dry when at rest during the winter. They can be successfully grown in any ordinary dwelling room window provided there is a moderate amount of light. The plants are easily propagated by divisions after flowering, and by seeds, which should be sown as soon as they are ripe. *J. Heal.*

The Week's Work.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Foliage Plants.—Codiaeums, (Crotons), Dracenas and others required for table decoration if needing potting, should be shifted in the smallest sized pots that will accommodate them. Use a rich compost consisting of equal parts of loam and peat with a little plant fertiliser. Those grown for specimens require larger pots and liberal treatment. Syringe them daily, and to prevent injury to the young foliage by insects fumigate or spray with an insecticide.

Begonia.—Plants of Begonia, Gloire de Lorraine and other fibrous-rooted kinds, raised from cuttings, require a shift into larger pots, using light soil well mixed with leaf-mould and a little dried cow-manure. Do not pot too firmly, and after the plants are potted place them in a warm house near the roof glass. Tuberous-rooted Begonias raised this year from seed may be shifted into larger pots, using similar compost. Pick off the flowers to throw strength into the plants. Old established specimens in flower should be given weak liquid manure, and be fumigated frequently to destroy insect pests.

Chrysanthemums.—Care should be taken to prevent any check to growth; provide slightly larger pots, if necessary, preparatory to the final potting some time next month. In preparing the soil for the final potting, the nature of the loam must be considered; use three parts of good fibrous loam, one part leaf-mould, one of old Mushroom bed manure, some coarse sand, and a little bone-meal. If the loam is light, use four parts of it, two parts of horse manure, one each of leaf-mould and sand, and a little bone meal. Pot firmly, and particularly so if the soil is light, staking the plants at once and placing them on an ash base. If the soil is moist, root waterings will not be necessary for some days, but spray the plants daily, and to prevent insect attacks dust the points of the shoots with an insecticide.

Gardenias.—Plants that have flowered should be cut back into shapely form and placed in a warm house. Syringe them freely, and after they have made a little growth repot them in a compost of equal parts fibrous loam and fibrous peat, with some sharp sand and a little bone-meal. Replace them in a warm house and syringe them frequently. Young plants produce the best flowers, and attention should be given to potting rooted cuttings and pinching the strong shoots to induce the formation of shapely plants.

Marguerites.—The best varieties are most useful for early autumn flowering in the greenhouse, and young stock should now be ready for potting into the pots in which the plants will flower. Use a mixture of good loam, leaf-mould sharp sand, mortar rubble, and bone-meal. Place the plants in a close frame for a time and syringe them daily, afterwards gradually hardening them off.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Summer Pruning Gooseberries and Currants.—This work is seldom done, but where it is, the fruit and also the trees are greatly benefited thereby. The bulk of the shoots should be removed from the centre of the trees, and the main branches should be moderately thinned so as to allow the sunshine to reach the fruits. All suckers should be cut out.

Strawberries.—Strawberry plantations should now be hoed, cleared of weeds, and bedded down with litter or clean straw. If the weather is hot and the ground at all dry, afford a good soaking of water. If stable litter or straw from

Potato clamps is used among the Strawberry plants, the finer parts should be shaken out, and it is a good plan where possible to wash it after it is placed in position by means of a hose, but this is best done before the plants come into bloom. Grass mowings are useful for putting under the straw to keep the soil moist.

Thinning Strawberry Fruits.—Generally, the first Strawberry fruits are the largest, and if large fruits are required for dessert it is advisable as soon as the fruits have set to thin them to about 10 per plant. A useful contrivance for securing early Strawberries, and also for putting over the fruits in excessively wet weather, is the Continuous Cloche. It is easily put on and allows free ventilation. Under the cloche the fruits ripen nearly three weeks earlier than those not covered.

Newly Grafted Trees.—These should now be examined, and when the scions have made shoots about six inches long, the ligatures should be loosened. Where clay was used at grafting time this will come away easily if the weather is moist and damp, and it is always best to moisten it with water if the weather is hot and dry. Scions that are not properly united with the stock should be bound up again and some fresh clay applied. Supporting stakes and ties should be provided to make the grafts secure against wind. All growths should be removed from the stock when the scions are growing freely. Trees budded last year should be kept clear of all growths on the stocks, and also of suckers.

THE ORCHID HOUSES.

By G. H. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Dendrobium.— The evergreen members of this fine genus—D. chrysotoxum, D. densiflorum, D. thyrsiflorum, D. suavissimum, D. Brymerianum, D. clavatum, D. aggregatum, D. Farmeri, and others—are attractive Orchids, which flower at about this season, and make splendid subjects for exhibition or bold decorations. After the flowering period, new growths soon appear from the base of the plants, and any necessary repotting should be done just as new growth commences. The roots of the stronger growing, evergreen kinds are usually larger and more robust than those of the deciduous species, and the compost for them may with advantage be used in a rough state, and should consist of two parts Osmunda or A1 fibre to one part of Sphagnum-moss, with plenty of crocks and charcoal added. Old and decaying compost is harmful to the roots; therefore, in repotting, it is necessary to pick it out. As a rule, the roots are not long-lived, and no harm need be apprehended from their disturbance. For most of these Dendrobiums the pots or pans may be larger than those usually used for the deciduous section, and they should be well drained and the plants firmly potted. After repotting, place them at once in their growing quarters. The dwarf growing species are best grown suspended from the roof rafters, while the taller growing kinds should be accommodated on the plant stage. For a time they will require very little water at the roots—only enough, in fact, to keep the rooting material just moist—but plenty of atmospheric moisture and frequent light sprayings overhead when the weather is bright and warm will encourage them. During the growing season, and when the plants have made good progress, liberal supplies of water are needed. These Orchids thrive best and keep more regularly to their season of growth and rest, when grown in a house such as is used for Cattleyas, where an even temperature is maintained, than when grown in the hottest division.

D. Phalaenopsis Schröderiana.—Specimens of this Orchid will now be starting into growth, and the present is a good time to repot or re basket any that need it, and to surface-dress any that are in fairly good order and do not require potting. This species does better in small, perforated pans or shallow baskets than in other receptacles. The plants should be grown close to the roof-glass in the warmest house, where they will receive abundance of light, heat, and moisture. When in full growth, liberal waterings may be given, and the syringe should be used freely amongst the plants whenever practicable. Being sun-loving Orchids, very little shade is necessary, and therefore only the thinnest of shading material should be used, and this only during the warmest hours of the day in summer.

D. Dalhousieanum.—The tall kinds, D. Dalhousieanum, D. moschatum and D. fimbriatum, are stately plants, and the racemes of flowers they produce are as fine as any in the genus. They are commencing to grow, and any repotting necessary should receive attention forthwith. They require fair-sized pots, which should be provided with ample drainage, and a rough open compost is necessary for the roots. During the growing season these vigorous-growing species delight in a tropical temperature and an abundance of moisture both at their roots and in the atmosphere.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet, Hertfordshire.

Summer Bedding.—It will now be quite safe to transfer most kinds of bedding plants to their summer positions. Assuming plans of the various designs have been previously prepared and that suitable subjects have been grown and properly hardened, the work should proceed rapidly. Harmony rather than strong contrasts in colour should be considered. Never plant unless the roots are thoroughly moistened before turning the plants out of the pots. Leave the most tender plants until the last, and in every case give a good watering immediately after planting.

Tuberous-rooted Begonias.—To obtain the best effect from these plants they should be strong, sturdy and well hardened prior to planting them out. The soil in the beds must be deeply cultivated and thoroughly enriched with decayed manure. Apply a good mulch after planting, and provide an abundance of water and liquid manure at intervals in dry weather, after the plants have become established

Cannas.—Both in mixed borders and in the sub-tropical garden Cannas make a pleasing display, both as regards flowers and foliage. They are fast growers and should be planted in good soil and given plenty of water and liquid manure at the roots in dry weather.

Bamboos.—These may be increased by division when new growth is being made. Plant the tenderest species in sheltered positions and prepared soil and give all the kinds shelter from north winds.

Watering.—Choice, late planted trees and shrubs should be watered as needed, and a mulching of short manure or some other material over their root areas will help to keep the soil moist.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Ridge Cucumbers.—The Ridge Cucumber is very productive, provided good plants are placed in prepared trenches, using, if obtainable, decayed pig-manure, and failing this, well decayed stable or farmyard manure. Plant at 15 inches apart, and water the roots liberally, using liquid manure at each alternate watering when the plants are fruiting.

Beetroot.—The main crop seedlings should be thinned, but not too severely; if birds are troublesome, leave the final thinning until the plants are strong. Ply the hoe regularly between the rows, and as a fertiliser, and also as a deterrent to slugs, apply a dusting of soot.

Tomatos.—The January-sown Tomatos are now growing well as a result of finer weather. Abundant ventilation is essential to fruitfulness. Plenty of water will be required at the roots. Suppress all side shoots, and remove part of any leaf that may interfere with the progress of the fruits.

Runner Beans.—Seedlings raised in pots and boxes may be safely planted out. Place them in a double line, at 1 foot apart, in trenches that have been liberally manured. Always plant firmly and stake the rows at once.

Celery.—The main crop Celery seedlings are now ready for planting out. Choose dull weather for planting, and lift the plants after the roots have been thoroughly moistened. Plant firmly, water the plants in and give periodical dustings of soot to ward off attacks of Celery fly.

Potatos.—Many rows of early varieties will be ready for earthing up. Hoeing should precede the moulding up, as the soil will then be fine and easily worked. If the Potato growth appears to be weak, give a slight dressing of sulphate of ammonia, or soot, when hoeing.

French Beans.—The climbing varieties growing under glass will now need abundance of fresh air. Afford frequent manurial watering so long as the blooms set well, and syringe the plants both morning and evening.

Dwarf French Beans.—Make fortnightly sowing out of doors, in lines 2 feet apart, and thin the resultant seedlings to 1 foot apart in the rows. Magnum Bonum and Canadian Wonder are first-rate varieties.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Figs in Pots.—Fig trees that have borne an early crop should now be showing a second crop of fruits. If these trees are required for early forcing next season they should not be encouraged to carry a second crop, or they will be weakened for early forcing. Now is a good time to repot young trees, as the roots are active and will readily permeate the new soil and assist in building up fruitful growth for next season. Avoid giving too large a shift, as the Fig tree quickly attains a large size, and if allowed much root room poor fruiting wood results. The new soil should be of a calcareous nature and potting should be done as firmly as possible, but ample space must be left for watering and feeding when the trees are in fruit. Larger plants not requiring a shift should receive liberal top-dressings. Trees for mid-season supplies should be given liquid manure freely and have their fruits thinned. The latest batch of trees should be kept as cool as possible.

Figs in Borders.—The fruits on trees started early will now be ripening, and until the crop is gathered a drier atmosphere must be provided by increasing the ventilation of the house, and damping down less frequently. A sudden rise of temperature will cause the fruits to crack and split badly. The fruits should be fully exposed to the light to secure good colour and flavour. Successional trees, if long established, and particularly those in borders restricted in area, should, if necessary, receive a thorough application of water at the roots just before the fruits commence to ripen. In the case of old trees, liquid manure is of much benefit to the present and succeeding crops. All useless spray growths should be removed and the shoots stopped if necessary, but good leading growths should be allowed to extend if there is room. Air should be freely admitted both by day and night, provided the weather is favourable. Young trees should not be fed, and care should be taken to secure good bottom growth.

Strawberries.—It is often a difficult matter to find suitable quarters for the latest batches of plants. An orchard house will meet their requirements, as within its shelter they will receive plenty of light and air. Failing such a structure, the plants may be arranged in cool pits or frames, with sufficient head room to allow a free passage of air between the foliage and the glass. The fruiting stems should be supported with Birch twigs, old Birch brooms being useful for supplying these. Plenty of water is most essential to secure fine fruits, and feeding should continue until the crop commences to colour.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.0°.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, May* 28, 10 a.m.: Bar., 30.2, temp., 64°. Weather—Bright sunshine.

Horticultural Education and Research*. The Government's programme of land settlement makes it particularly important that the organisation of education and research relating to Horticulture should be completed and perfected; for although it is true that success in horticultural industry depends ultimately on the application and enterprise exhibited by those who engage therein, it is none the less true that both education and research may both aid the individual and raise the standard of production.

For education to play its part in bringing about these results, it must be both accessible and practical in the proper sense of the word. The aim of horticultural education should not be to teach pure science, however excellent may be a knowledge of the principles of biological science. Its aim should be to teach horticulture. Since however, the practice of horticulture depends in part on empirical knowledge acquired by its pursuit and in part on the application of known and proved scientific principles it would be as wrong for the instructor to ignore science as it would be to insist on imparting purely scientific knowledge in the hope that some day it might come in usefully. The success which has attended the Wisley School of Horticulture has been due not only to the unique facilities which the gardens offer but also to the fact that under the guidance of Mr. Chittenden, a just balance between science and practice has been maintained. The methods adopted may well be regarded as a model, and the essence of these methods consists in using science as a guide, philosopher and friend, and not insisting on obeisance to her as of a slave to a tyrant. For example: to lecture on the chemistry of soils before a student has had any experience in the working of any particular soil, is to invert the proper order. On the other hand, when a student has learned something of the special characters of a soil, science can be of real and great help to him, not only in supplying the generalised explanation of these characters, but also in preparing him for what he must expect if he has to work a different kind of soil. Thus, if used properly, science is a great intellectual labour economiser, though it is not and never can be a substitute for that labour or, for that matter, for manual labour either.

Similarly if we are to appreciate research as a means of progress, we must not take a too academic view of what is meant by research. The prominent position occupied by the British horticultural industry is not only due to the energy and initiative of its members, but is due also to the spirit of research with which they are imbued. The great improvement in seeds, in seed Potatos, and in flowers, examples of which are to be seen not only in the great exhibitions, but in every garden in the land, is due to research: research in trial grounds, in plant houses, and, it is pleasing to observe, also in laboratories set up in recent years by private firms. Since ultimately the amount of attention which a nation devotes to research depends on the general estimate of its importance, which is found by the people of that nation, it is important that it should be realised that research is of two kinds. The one kind is what may be called special research, and the other pure or general research. The former has a limited and special objective, the latter seeks to discover something new and unsuspected. The one is conventional, effected by applying existing knowledge; the other is revolutionary, discovering new knowledge. As an example of the former, it is common knowledge that we require new varieties of fruit. The method by which new varieties may be produced, has been practised and is known. It only remains to apply that method for the results—sooner or later—to be achieved.

As an example of pure research, we may consider the problem of immunity from disease. Much is known of the nature of immunity of animals from disease, nothing is known of the nature of the similar immunity which exists in plants. For research into this most important question, new ideas are wanted, for the architecture of plants is so different from that of animals, that it is at all events likely that the mechanism is different in the two kingdoms.

Research, then, embraces a long series of operations, some simple, direct and within the capacity of everyone with land and leisure; such for, example, as testing varieties suitable to special districts and soils, and comparing insecticides and fungicides one with another as to their effects. Other research is complex and indirect, and requires in those who prosecute it, special training. All kinds need encouragement, and the possibilities which lie before the nation which believes in research and ensures it are indeed bright.

As examples of the value of the results which follow on special investigations, may be mentioned the research initiated by the Royal Horticultural Society and carried out by Mr. Ramsbottom on means of destroying eelworm in the bulbs of Narcissus. The method which has proved effectual, that of immersing bulbs in water at a temperature of 11°F. for five hours, was first used by one of our leading growers Careful tests were, however, required to perfect and control the method, and have resulted in the perfection of a fairly simple remedy. Further research will doubtless discover a yet simpler method of combating this pest.

Another example of a research destined to be of great value to fruit growers is provided by the work on Apple stocks carried out by Captain Wellington and Mr. Hatton, of the East Malling Fruit Station of the S.E. College, Wye.

As a result of this research, the various and mixed Paradise stocks have been sorted out and diagnosed, so that it is now possible to procure a uniform, suitable and easily raised stock either for bush trees in commercial orchards, for bush trees in private gardens where the space is available, or for standards or half standards. Other examples might be given, as for example the researches in soil sterilisation by chemical and other means now being conducted at Rothamsted, and by the Lea Valley Growers Association at their station at Waltham Cross.

The brightest hope for the future development of British horticulture lies in the evidence that those on whom the industry depends are more acutely alive now than ever before to the need for research, and are prepared to encourage it by every means in their power. The more closely the industry is associated with research the better it will be for all; for on the one hand the practical man who takes an interest in this delicate work soon learns that much labour is involved even in the solution of the simplest problem; on the other hand he is often able to point out to the researcher who lacks his experience as a practical grower, what are the most important of the problems which require solution.

* Lecture by Dr. Keeble, F.R.S., at the R.H.S., Chelsea Exhibition, May 20, 1919.

Birmingham Horticultural Society's Floral Fête.—The flower show of the Birmingham Horticultural Society, to be held in Handsworth Park on July 18th and 19th, will be opened by the Right Hon. Lord Lambourne, C.V.O., President of the Royal Horticultural Society.

Manchester and North of England Orchid Society.—Exhibitions and meetings of the Committee of the Manchester and North of England Orchid Society will be held on the following dates:—(1919), June 5, 19, July 3, 17, September 4, 18, October 2, 16, November 6, 20, December 4, 18; (1920), January 8, 22, February 5, 19, March 4, 18, April 1, 15, May 6, annual meeting.

Allotments.—According to the *Journal of the Board of Agriculture* for May, allotments are producing annually an estimated quantity of not less than five hundred thousand tons of food. The Guildford Allotments, which have been taken over under D.O.R.A., have lately been visited by a sub-committee of the Town Council with a view of retaining a certain portion as permanent allotments. About 20 acres have been approved by the Town Council as such. There are now 1,740 plot-holders in the borough, and further applicants have still to be accommodated. Godalming is taking action towards providing permanent allotments, and the Town Council has appointed a sub-committee to inspect and report at the next meeting of the Town Council. The Southampton Allotment Association is making arrangements to celebrate the Peace by giving a treat to the members' children. The Society now controls over 200 acres of land in the borough and has some 2,500 members.

Sulphate of Aluminium for Slugs.—Gardeners whose plants are infested with slugs should try the effect of a solution of sulphate of aluminium as a means of destroying these pests. One part dissolved in 1,000 of water is said to be effective, but to be on the safe side it may be used at a strength of 1 to 500 of water and is best sprayed on the plants—which it does not harm—at dusk on warm, wet days. To make up a solution of this strength 1 lb. of sulphate of aluminium should be dissolved in 50 gallons of water or, roughly, 1 oz. to 2 gallons.

Chelsea Show.—Beautifully fine weather attended the three days during which the Chelsea Show was open to the public, consequently very large numbers of Fellows and visitors inspected the splendid display provided by British horticulturists in the grounds of the old Chelsea Hospital. It must not be forgotten that fine weather immediately before and after the great show is very important to the exhibitors, who on this occasion were especially fortunate. In our report in the last issue we regret that no reference was made to Mr. Charles Turner's fine group of Roses, Mr. Ernest Dixon's dainty little sunk garden, and Mr. James MacDonald's display of grasses and miniature putting greens. Messrs. Armstrong and Brown's beautifully arrayed exhibit of fine Orchids, for which they were awarded the Coronation Cup, is illustrated in Fig. 138, but no illustration is capable of portraying the exceptional elegance of this large group, in which every plant was displayed to the fullest advantage. In point of brilliance and massed effect, the exhibit made by Messrs. Jas. Carter and Co., and consisting largely of popular greenhouse plants, was an outstanding feature of the Show (see Fig. 137). New plants and flowers were numerous, and in addition to those illustrated in the last issue we now give figures of Schizanthus wisetonensis Snowflake (Fig. 136), pure white, exhibited by Messrs. Watkins and Simpson; and perpetual-flowering Carnation Saffron (Fig. 135), yellow, shown by Mr. C. Engelmann. All these plants were fully described under "Awards," on p. 258, in the issue for May 24.

Kent Commercial Fruit Show.—A general meeting of the Kent Commercial Fruit Show was held at Maidstone, on Thursday, the 22nd inst., when a very widespread interest was taken in the revival of the exhibition. The show has not been held since the autumn of 1913 on account of the war, the 1914 show, after all the preliminary arrangements were made, having to be abandoned. The meeting was attended by many of the leading growers of fruit in the county of Kent, and Mr. M. J. R. Dunstan was asked to take the chair. A strong and representative committee was elected as follows:—Messrs. M. J. R. Dunstan (chairman), W. S. Austen, E. A. Bunyard, E. B. Burns, B. Champion, G. E. Champion, H. Champion, H. G. Edmonds, W. T. Edmonds, L. Doubleday, W. R. Elgar, O. English, W. D. English, T. Hubble, W. N. Hubble, G. Foster Clark, J. Finnis, T. Kemsley, G. Manwaring, S. Mount, C. Murdoch, F. I. Neame, J. A. Raynham, E. S. Salmon, W. H. Skinner, F. Smith, S. Smith, C. S. Smith, A. J. Thomas, S. Wakeley, S. Wellard and C. Woodruff. Mr. W. Miskin, The College, Wye, Kent, was appointed Hon. Secretary. It was decided to hold the 1919 show at the Agricultural Hall, Maidstone, on October 28, 29 and 30. Several members wished to fix the place of the 1920 show, but it was felt by most of those present that it was not desirable to settle this matter definitely until after the 1919 show.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Fruit Growers' Conference.—With reference to the Fruit Growers' Conference, on Friday, May 9, at the Central Hall, Westminster, I regret that the notice passed out to the Press appears to have been somewhat ambiguously worded. At the conference, which was convened for fruit growers, other sections of the fruit trade were given an opportunity of expressing their views in an open discussion allowed by the chairman during the first hour. They were, however, precluded from speaking to, or voting upon, any of the resolutions passed at the meeting. These resolutions will be dealt with at the next meeting of the Organising Committee of the Chamber, for the purpose of considering a further conference of all sections of the trade in the near future. *R. Wynne, Secretary, Chamber of Horticulture.*

Apple Sure Crop.—I was extremely interested in the note on Apple Sure Crop on page 206, and my experience of the variety may be of interest. It lives up to its name "Sure Crop" by returning year by year bumper crops of excellent fruit. My opinion of the variety is so high that I have without hesitation recommended it to intending planters on the look out for a good Apple. My trees were planted on a very stiff clay, with a cold, wet, sticky subsoil. The situation is very exposed to winds on a slope facing west. The trees were grown as bushes on the broad-leaved Paradise stock. Being unfamiliar with the variety I tried several systems of pruning; the method I found to answer best was to let the trees grow of their own free will and simply remove sufficient wood to ensure an adequate supply of air and sunshine for the trees requirements. A special feature of Sure Crop appears to be its immunity to Woolly Aphis. I had varieties in the same plantation side by side with Sure Crop which was badly infested with this pest. Yet Sure Crop withstood its attack. I have some recollections of Sure Crop being exhibited in pots by the King's Acre Nursery Co., at Shrewsbury several years ago. It would be interesting to know the experiences of other growers of this excellent variety, which appears not to be so well known as it deserves to be. *W. Stewart, N.D.H.*

Gardeners' Hours and Wages.—A lady near my nursery has let her garden to a market gardener, and says she can buy all the flowers and vegetables she requires at half the price she paid her gardener. Many, through high wages and high income tax, have moved into smaller houses in the town and have dispensed with their gardeners. One of your correspondents states that if a lad of eighteen is good enough for the Army and paid the same rate as older soldiers, he is worth it on the land. Such argument is without reason and altogether wide of the mark. Is a lad of little experience in the garden equal to a gardener of many years' experience? The Agricultural Wages Board made a great blunder in fixing the wages of a lad of eighteen at 30s. per week, for many of these lads are undersized striplings. As for the eight-hour day for which the unions are agitating, with a half-day off on Saturdays, the whole thing is ill adapted to the profession of a gardener. *Nurseryman.*

(See awards at the Chelsea Show, page 258.)

ORCHID NOTES AND GLEANINGS.

LAELIO-CATTLEYA AERO.

FREDERICK J. HANBURY, Esq., Brockhurst, East Grinstead, sends a fine flower of this new cross, raised in his gardens, between L.-C. G. G. Whitelegge (C. Hardyana × L.-C. callistoglossa) and C. Percivaliana. The flower, which is seven inches across, has a silver-white ground slightly tinged with lavender colour, and delicately veined with rose, the broad labellum having well-defined orange lines extending to the centre, which is tinged with purple. In size and form it partakes much of the C. Warscewiczii in both the parents.

SCHOMBOLAELIA TIBIBROSA.

Mr. Hanbury also sends a flower of this interesting cross between Schomburgkia tibicinis and Laelia tenebrosa which verifies the brief description of it in *Gard. Chron.*, Aug. 2, 1913, in the report of the Royal Horticultural Society's meeting of July 29, when the cross was first shown by Messrs. Charlesworth and Co. "The flower resembles L. tenebrosa and is bronzy-orange with a rose-veined lip." In the flower sent the lanceolate sepals are curiously incurved, probably due to the influence of S. tibicinis, which is also responsible for the rose flush at the back. The lip is light rose, darker in the centre, to which run purple lines from the base.

All bigeneric hybrids are interesting, particularly those which combine widely divergent forms of flowers and distinct habits of growth.

SOCIETIES.

ROYAL HORTICULTURAL.

MAY 27.—After the business and brilliance of the Chelsea show, and with only a week's interval, it was only to be expected that the meeting on Tuesday last would be poorly attended and the exhibition a small one. Sweet Peas, Orchids, and flowering trees and shrubs were the principal subjects displayed, and there was a fair number of novelties. This was the third meeting and exhibition in a fortnight.

Floral Committee.

Present:—Messrs. H. B. May (in the chair), W. J. Bean, John Green, John Heal, J. F. McLeod, W. Howe, C. R. Fielder, Chas. Dixon, E. H. Jenkins, H. R. Darlington, W. B. Cranfield, G. Reuthe, R. C. Notcutt, and H. Cowley.

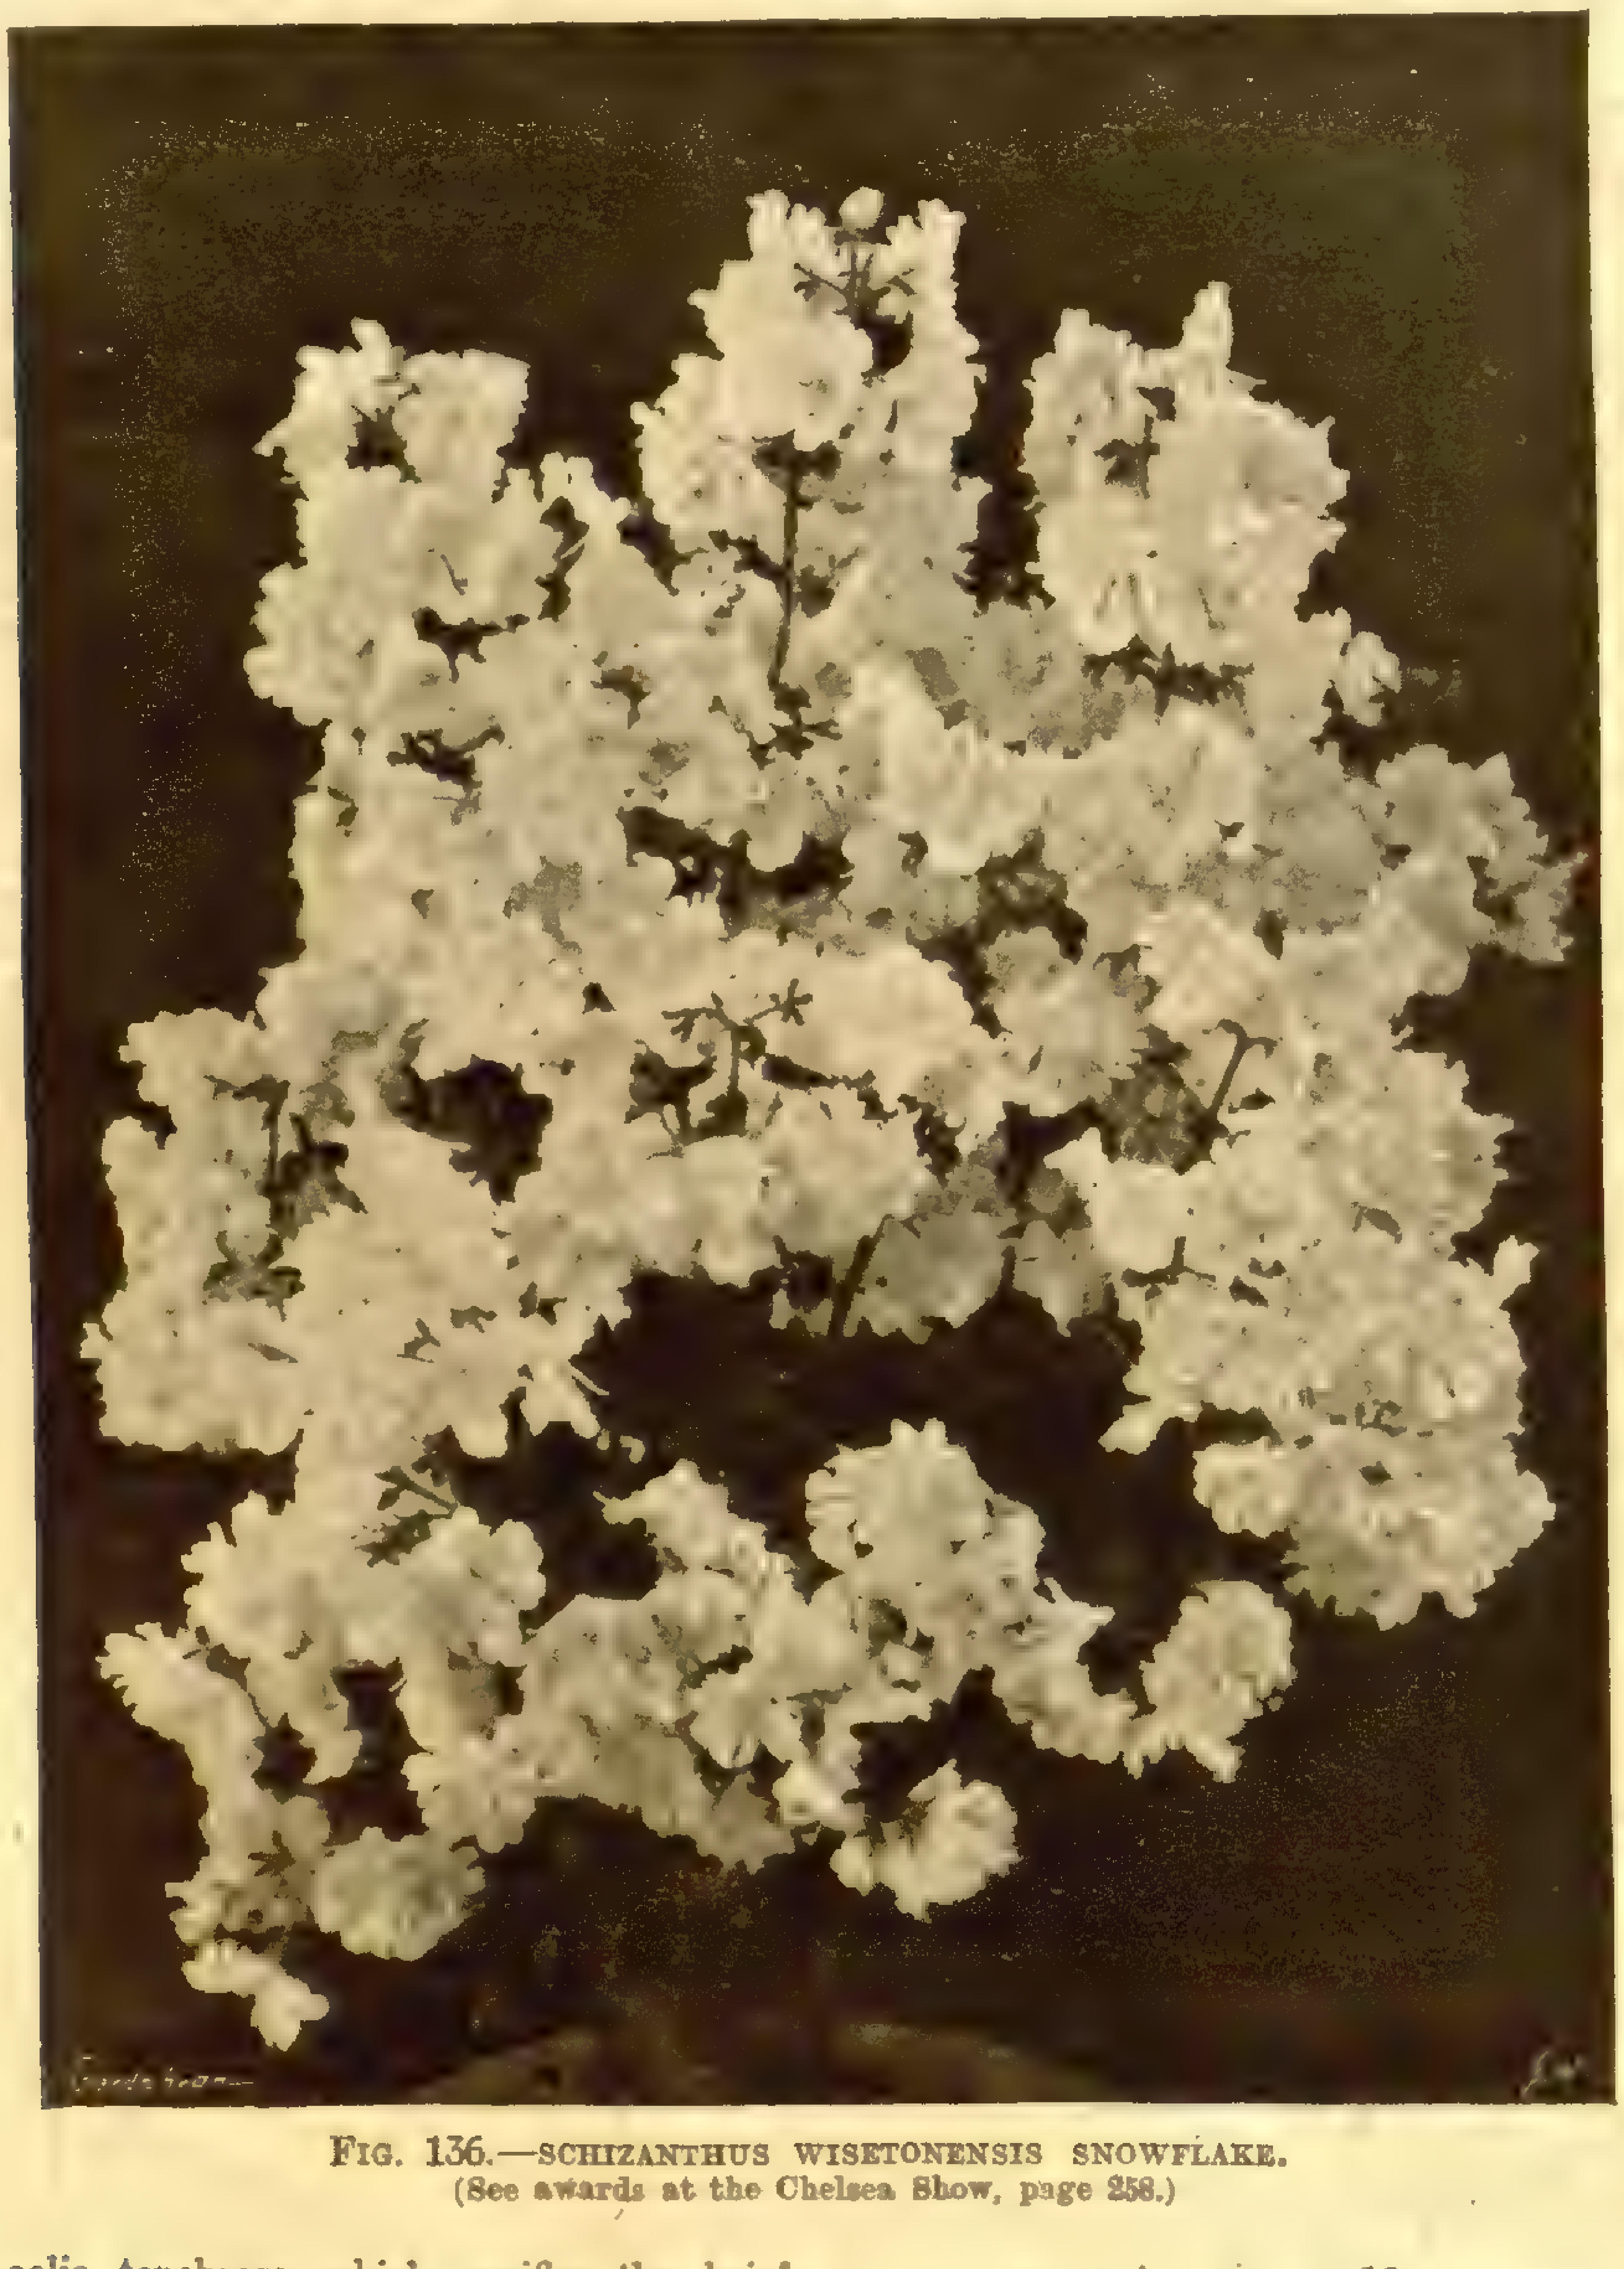

FIG. 136.—SCHIZANTHUS WISETONENSIS SNOWFLAKE.
(See awards at the Chelsea Show, page 258.)

AWARDS OF MERIT.

Cytisus sessiliflorus.—A showy, early summer-flowering shrub that grows about 4 ft. high. The growths are slender and stiff, and on the new twigs the golden-yellow flowers are freely borne. The leaves are small, trifoliate, sessile, and light green. The plant does well when cut to the ground every year or two. —Shown by Miss WILLMOTT.

Sweet Pea Hawlmark Maroon.—A very fine Sweet Pea with bold and large flowers, in which the standard is erect, waved, and widely spread. It is a self-coloured variety, and the colour is deep rich bronzy maroon.—Shown by Messrs. ALEX. DICKSON AND SONS.

Primula Harroviana.—A low growing species with little tufts of bright green, crenate margined leaves, each about 3 inches long. The whole plant is about four inches high, the slender spikes being covered with white meal. The flowers are pure white, in close heads, some of the flowers being pendant and others standing out horizontally. The corolla is broadly bell-shaped, half an inch across, and has very highly fimbriated margins. Shown by Mr. A. K. BULLEY, Neston.

Ramondia pyrenaica pallida. As shown, this is a strong growing plant, the specimen carrying nine spikes of bloom. The colour of the flowers is soft, light bluish mauve. Shown by Mr. T. TEMPLE WEST, Redhill.

OTHER NOVELTIES.

In addition to the novelties which secured Awards there were several interesting, rare plants shown. Mr. BULLEY exhibited the dainty little white-flowered Primula Reidii; P. Hopeana with cream-coloured flowers and somewhat suggestive of P. sikkimensis in form and habit; and P. Orange Beauty, a brilliant orange vermillion flower of large size and, apparently, with a vigorous habit of growth. MISS WILLMOTT exhibited long trailing and flowering growths of the shrubby climber Schizandra chinensis.

The brilliant Paeonia lobata was well shown by Mr. GIFFORD, who grows this species largely and well. Mr. E. MARSDEN JONES, Tilston, Malpas, showed Cheiranthus Pamela Pershouse, a large golden-flowered perennial obtained by crossing C. alpinus with C. Allionii; it is fragrant and has already survived three winters unharmed out of doors; Geum Dolly North, vivid orange, from the same exhibitor, was also good.

GROUPS.

A large number of interesting hybrid Calceolarias were shown from the JOHN INNES INSTITUTE, Merton. The colour range, as well as the divergence of habit foliage, was large, but the most attractive was C. Allardii (integrifolia × plantaginia crossed with a yellow herbaceous variety), golden yellow. (Silver Flora Medal.) Messrs. DOBBIE & Co's long-spurred Aquilegias received unstinted admiration; the pure white, blue and white, deep blue and white, yellow and pink, yellow and bronze, and pink and white forms were all very beautiful in size, form and colouring (Silver-gilt Banksian Medal).

A large group of very fine Sweet Peas, set up by Messrs. ALEX. DICKSON & SONS, was composed only of the new varieties Brocade, Hawlmark Pink, Hawlmark Maroon (see Awards) and the blush Daisy Bud (Silver-gilt Flora Medal). Mr. J. STEVENSON was also an exhibitor of Sweet Peas, and showed his new seedlings Brilliant Hebe and Crimson Seedling. Mr. ROBT. BOLTON put up large vases of his new, handsome Sweet Peas, Magie, a pretty combination of blue and rose; and Commander Godsal, navy blue and purple maroon.

A handsome group of cut blooms of good garden varieties of Rhododendrons was exhibited by Miss C. WARNER (gardener Mr. Stevens), Belle Orchard, Hawkhurst—a ladies' school of gardening (Bronze Banksian Medal). In Messrs. CHEAL & SON'S display of flowering trees and shrubs the Lilacs and Mollis Azaleas were very showy; white Viburnum tomentosum, V. Moriesii, Rhododendron Pink Pearl and Piptanthus nepalensis were other good things (Silver Banksian Medal). Exquisite varieties of Lilacs, and finely grown, were exhibited by Mr. CHAS. TURNER. In many instances the growths carried large double spikes and in all cases the flowers were large; Congo, deep rose; Negro, reddish purple; Réaumur, magenta rose.

Messrs. STUART LOW & Co. were the only exhibitors of perpetual Carnations, and they showed fine specimens of Hon. Charlotte Knollys and Mephisto (Silver Banksian Medal). Mr. JAMES DOUGLAS showed border Carnations in good form and variety, including the new Cleopatra, The Grey Douglas, Lord Kitchener and the yellow Goliath (Bronze Flora Medal).

The beautiful new H. T. Rose, Mrs. Elisha Hicks, represented by about a hundred blooms, was the central feature of a large group of Roses contributed by Mr. ELISHA HICKS. Rosa Moyesii, the fragrant cream-white R. altaica, the purplish rose R. Willmottii, with Joanna

Bridge, and Climbing Lady Hillingdon were other good things (Silver Flora Medal). Mr. EDWARD CHATER, Finchley, contributed two-and-a-half dozen old English florists' Tulips, some of them very handsomely flamed. flowers, the example of William Lea being very attractive.

Orchid Committee.

Present: Sir Harry J. Veitch (in the Chair), Messrs. Jas. O'Brien (hon. secretary), T. Armstrong, W. Bolton, W. H. White, and Frederick J. Hanbury.

AWARDS.

FIRST-CLASS CERTIFICATE.

Laelio-Cattleya Excelsior var. The Globe (L.-C. Canhamiana alba × C. Mendelii), from PANTIA RALLI, Esq., Ashtead Park, Surrey (Orchid grower, Mr. Farnes). A grand hybrid, differing widely from the fine form for which Mr. Ralli received a First-Class Certificate at the Chelsea Show. The sepals are white, petals three inches across, white, with a broad light mauve band up the middle; lip, broad rich mauve purple, with some dark lines running into the light yellow disc; the narrow margin being white.

Odontoglossum harvengtense, Pitt's variety (crispum × triumphans). In 1896 H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), obtained a First-Class Certificate for one of the earliest forms of this pretty and variable natural hybrid, and the first to be shown as Rosslyn var. Since that some twenty varieties have received Awards at the Royal Horticultural Society. A dozen or so of the best of them had been painted, and the paintings were compared with the Pitt's variety now shown, but none was comparable to it. The large flowers had pale canary yellow sepals with a few reddish blotches, the petals being also canary yellow, with the inner basal area white. The lip bore one chestnut red blotch, and a few smaller ones in front of the crest.

AWARD OF MERIT.

Cattleya The Bride (Warscewiczii alba var. Firmin Lambeau × Düsseldorfei Undine), from Messrs. FLORY AND BLACK, Orchid Nursery, Slough. A fine pure white variety, larger in size than other crosses of C. Düsseldorfei Undine, and taller in habit, but retaining the form of flowers of that hybrid, as shown on the three-flowered inflorescence borne by the plant on its first spike . It is probable, however, that when mature the broader petals of the white-flowered C. Warscewiczii will be more in evidence.

PRELIMINARY COMMENDATION.

Odontoglossum Tityus (crispo-Harryanum × President Poincaré), from Messrs. CHARLESWORTH AND Co., Hayward's Heath. A very fine flower of perfect shape, white, with large violet purple blotches.

GROUPS.

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), showed a fine group, in which the hybrid Odontoglossums and Odontiodas were well represented, but the feature in the group was made by the presence of an exceptionally fine selection of species, among which were two splendid specimens of the emerald green and black Coelogyne pandurata, each with two spikes; C. Massangeana, C. speciosa, the fringed-lipped Chondrorhyncha Chestertonii, Lycaste Lawrenceana, Nanodes Medusae, Epidendrum Wallisii and E. prismatocarpum, Bulbophyllum Lobbii siamense, Maxillaria lepidota, Renanthera Imschootiana, and good forms of the best Cattleyas (Silver Flora Medal).

Messrs CHARLESWORTH AND Co., Hayward's Heath, staged a good group with many fine Odontoglossums, the new O. Tityus (crispo-Harryanum × President Poincaré) being one of the best. Miltonia Charlesworthii, with its large rose flowers with dark mask to the lip, was very attractive, and specially good were Cattleya Warneri Ardenholme variety and Laelio-Cattleya Fascinator-Mossiae var. Princess Bibesco, with sepals and petals tinged with lilac and deep claret lip.

Narcissus and Tulip Committee.

Present:—Messrs. E. A. Bowles (in the chair), F. Herbert Chapman, F. Barchard, Peter R. Barr, W. Poupart, G. Reuthe, G. W. Leak, H. Backhouse, W. F. M. Copeland, Geo. Monro, Jun., W. B. Cranfield, Miss Willmott, Rev. J. Jacob, and C. H. Curtis (hon. secretary).

There were neither groups nor novelties before the Committee, but questions of registration of Daffodils, definition of show terms, next year's show and other matters were discussed at some length.

Fruit and Vegetable Committee.

Present:—Rev. W. Wilks (in the chair), Messrs. W. Bates, W. H. Divers, G. F. Tinley, and A. E. Vidler.

There were no entries, exhibits or business before this Committee.

ROYAL METEOROLOGICAL.

MAY 21.—The monthly meeting of this Society was held on Wednesday, the 21st inst., at the Society's Rooms, 70, Victoria Street, Westminster, Sir Napier Shaw, F.R.S., President, in the chair.

A paper by Capt. C. J. P. Cave and Mr. J. S. Dines, entitled "Further Measurements on the Rate of Ascent of Pilot Balloons," was read by Mr. Dines.

The report on the Observations for the Phenological Year—December, 1917, to November, 1918—by Mr. J. Edmund Clark and Mr. H. B. Adames, was also presented. The excessive cold of December, 1917, was followed by three mild months, February in particular. Hence by April 1st the Blackthorn was in most parts blooming, whereas after the very cold early months of 1917 the mean date was 35 days later than 1918. Rarely had the farm and garden promise at this date been so satisfactory. Then came the mid-April bitter weather, disastrous to the opening fruit tree buds, and a continuation of summer drought and coolness continued the prejudicial conditions. A genial August greatly favoured the earlier harvesting districts, but the excessive wet in September caused damage and loss elsewhere. The whole autumn was cool, but comparative dryness in October and November helped finally in the harvesting of nearly average field crops. Potatos gave a record for acreage and yield per acre, but after storage there was serious loss from disease. The migrant records support the interesting weather relationships shown by the other tables. The April cold delayed the appearance of the 16 earlier birds two or three days more than the other ten. The isophenal lines on the map indicate the districts where the plants of Table III. blossomed simultaneously. Their course shows the marked influence of elevation. On the same map are also shown the isotherms for the first half of the year, and a comparison of these with the isophenes is a matter of considerable interest.

The effect of the war has been felt in the loss of many of the observers who formerly contributed to this report, and an increase in the present numbers is much to be desired, particularly in the northern districts and in Ireland.

KEW GUILD.

One of the most pleasing functions held in London during a Chelsea Show week is the gathering of the past and present Kewites at the Annual Meeting and Dinner of their Guild. The gathering, held this year at Dean's Hotel, Oxford Street, was presided over by Capt. A. Hill, the Assistant Director of Kew. The Committee's Report for 1918-19 was presented and accepted. This showed that 25 Guild members have died in the service of the country during the war, while older and eminent members who have passed away recently include Mr. R. Hooper Pearson, Mr. E. J. Allard, Mr. W. H. Bennett and Mr. Walter Thomson. The Guild has now 382 life members, and it continues its benevolent work among those in special need. The accounts show a balance of £6 2s. 9d. on current account, and a deficit of £14 11s. 7d. on capital account. The fact is that the *Guild Journal* costs much more to produce than formerly, and the proper proportion of new life-membership subscriptions has not been transferred to capital account.

The question of raising subscriptions was brought forward, but as no action could be taken in the absence of due notice, a special general meeting is to be called to give legal force to the general feeling that there should be an increase. A motion that a member should be allowed to bring wife or lady friend—husband or gentleman friend, in the case of lady

FIG. 137.—MESSRS. JAMES CARTER AND CO.'S EXHIBIT OF INDOOR FLOWERING PLANTS AT THE CHELSEA SHOW.
(See page 271.)

members—to the Guild dinner, was adopted with about two dissentients.

The dinner was a great success, Capt. Hill again presiding. There were 105 members present, including many ladies and a considerable number of old Kewites from overseas and the provinces, and some who have gained distinction during the war. Capt. Hill proposed "The Kew Guild," and in doing so referred to the proposed memorial at Kew, raised by Kewites, to the Kew men who have lost their lives in active war service; to the changes at Kew, and to the possibilities the future holds in horticulture for trained Kew men and women. Mr. W. W. Pettigrew, Superintendent of the Manchester Parks, replied, and strongly emphasised the Chairman's statement that there was a great future for those gardeners who had the benefit of a Kew training. "The Chairman," proposed by Mr. W. W. Pettigrew, was the only other toast. A musical programme was provided by the members, with ample intervals for the renewal of old friendships and the creation of new ones, between the items.

ROYAL NATIONAL TULIP.

MAY 20, 21, and 22.—This Society pursues the very even tenor of its way. A whole tent was set apart for its exhibits at the Chelsea Show, and there were four exhibitors, so far as we could discover. Occasionally a visitor, or perhaps two, would enter the tent, gaze with almost pained astonishment at the few boards of "rectified" blooms; then at the back of the tent they usually discovered the Darwin and Cottage Tulips sent by Messrs. HOGG AND ROBERTSON, and Messrs. BARR AND SONS. Feeling in safe and familiar company, the visitors would give these their full meed of admiraton and then steal out of the tent, no doubt fearful of disturbing the solemn calm and quietude.

These "rectified" Tulips—the Flamed and Feathered Roses, Bizarres and Bybloemen, with their stems cut short, and sitting nakedly on show boards—were, of course, the *élite* which have entered the higher plane of Tulip life, but few of the casual visitors realised it, nor did they know that they were enjoying the privilege of inspecting the exhibition of a seventy-years-old Society. How could they in the absence of any explanatory literature or notice? True, after a diligent search, we discovered one schedule dated 1915 and, *underneath* the staging, a goodly-sized card bearing the Society's title.

However, the show's the thing. The two amateur exhibitors, Sir A. D. HALL, Merton, and Mr. C. W. NEEDHAM, Kelmscott, Hale, Cheshire, who are president and hon. treasurer respectively of this Society, shared the first and second prizes of the first four classes. Sir A. D. HALL was first with (a) 12 Dissimilar Rectified Tulips, and 2 Feathered and 2 Flamed in each class; (b) 3 Feathered Tulips, 1 of each class; and (c) 3 Flamed Tulips, 1 of each class. He was second in the class for 6 Dissimilar Rectified Tulips: 1 Feathered and 1 Flamed in each class, and received a Premier Prize for a bloom of Miss Willmott, a very beautiful Rose seedling. In the first class, Sir A. D. Hall had very good blooms of Rose Marie, fr. rose; Universe, fr. byb.; Dr. Hardy, fld. biz.; and Britomars, fr. byb.

Mr. C. W. NEEDHAM won the First Prize in the class for 6 Dissimilar Rectified Tulips, 1 Feathered and 1 Flamed of each class, in which he included good blooms of George Edward, fld. byb., and Samuel Barlow, fr. biz. He was second in classes A. C. and D.

In the Open Class, Messrs. HOGG AND ROBERTSON were awarded the First Prize for a very pleasing exhibit of 20 vases of garden Tulips. The vases of Salmon King, Cardinal Hanning, Petrius Hondius, and Marie were perhaps the very best.

Messrs. BARR AND SONS staged an interesting collection of Cottage and Darwin Tulips, not for competition.

An interesting exhibit was a branched stem of Mignon, a seedling Rose Tulip, bearing two flowers. The primary bloom was very fine and the secondary flower quite good.

FIG. 138.—MESSRS. ARMSTRONG AND BROWN'S EXHIBIT OF ORCHIDS AT THE CHELSEA SHOW, FOR WHICH THE "CORONATION" CUP WAS AWARDED. (See page 271.)

TRADE NOTES.

TAXATION OF TRADE ASSOCIATIONS.

NOTICE has again been given by the Board of Inland Revenue that subscriptions and levies paid by members of a Trade Association may be allowed as a trade expense in computing their income tax liability. This deduction is, however, subject to the Trade Association entering into a form of Agreement with the Board of Inland Revenue and it is possible that those Associations which may not be registered as "Companies trading not for profit" may be wondering whether the proffered concession may not prove a somewhat dangerous trap!

The terms of the Agreement which Trade Associations are desired to enter into, if they wish to avail themselves of the proposed agreement with the Board, are as follow:—

1. That the Association furnish copies of its Rules and Regulations to the Board of Inland Revenue.

2. That the Association renders annually accounts of its income and expenditure and pays tax on the balance of income over expenditure computed in accordance with the provisions of the Income Tax Acts, on the basis provided by clause four. In computing the balance, all administrative expenses, all payments to members of any kind (other than loans and payments of a capital nature) and all payments for legal charges in cases taken on behalf of the members, are to be treated as ordinary expenditure.

3. That members receiving payment of any kind (other than loans and payments of a capital nature) bring the amounts received to the credit of their individual trading accounts and that the Association shall furnish particulars yearly to 31st December of the amount paid in that way and to whom paid. In the event of any member or other person failing to account for the tax on any such receipts in the ordinary course, the amount is to be included in the assessment upon the Association, *i.e.*, by disallowing the items as deductible expenditure in computing the liability of the Association.

4. That the Association shall render accounts for the last completed year, and be assessed on such accounts for the year ending 5th April, that for the following year they be assessed on the basis of an average of the accounts for the two years preceding the year of assessment, and for the third year and subsequent years on the average of the three preceding years.

5. That the payment of subscriptions, entrance fees and levies be allowed, and receipts by members from the Association, if any, be credited in the accounts of the individual members for the three preceding years in computing the assessment for the financial year ending in April.

6. That the contributions or subscriptions by the Association to any other organisation be only allowed as expenses on production of the accounts of such organisation and on evidence that it has entered into similar arrangements with the Board of Inland Revenue, or has no surplus income which ought, on the lines of this Scheme, to be subjected to tax.

7. The existing and future accumulated funds of the Association to be regarded as taxed in-

come in the event of the Association being wound up and the funds distributed among the members.

8. No allowance is to be made or relief granted in respect of the excess of the expenditure of any year over the contributions, except so far as is necessary for the computation of the three years' average.

9. In the event of any dispute as to the admissibility or non-admissibility of any item of expenditure, the question shall be submitted to the Commissioners of the District or the Special Commissioners for determination in the ordinary course, and subject to the right of appeal to the High Court, provided that the terms of the agreement or the validity of the assessment made in accordance therewith shall not be otherwise impugned.

10. The association to give an undertaking to abide by these Regulations.

11. This arrangement may be determined by the Board of Inland Revenue or by the Association on twelve months' notice expiring on the 5th April, in any year.

It will be seen that the terms of the Agreement bind Trade Associations to give very full informaion to the Taxing Authorities and include an agreement by the Association to be assessed to income tax. For some time past the Authorities have been pressing at least one Trade Association connected with Horticulture to render accounts with a view to assessment, but it is difficult to see the equity of such a demand, even if Trade Associations are not registered as being companies not for profit. The fact remains that their objects are for the purpose of mutual defence and that, there is no question of making a profit for division among the members in the same way as a Trading Company would do. The anomaly of such a claim becomes all the greater when the fact is borne in mind that even Trading Companies such as the Wholesale Co-operative Societies pay no income tax. If however the Board of Inland Revenue were to promote legislation for the purpose of taxing the profits of Co-operative Wholesale Societies at the source a considerable addition to the National Revenue might be thus secured, and the financial advisers of the Government might well focus their energies in this direction. *H. M. V.*

An Order has been made by the Agricultural Wages Board revising the minimum and overtime rates for male workers of 18 years of age and over in England and Wales.

The revised rates of wages are now in operation, and will be payable as from Monday, the 19th May. Copies of the rates for any particular county may be obtained on application to the Secretary of the Agricultural Wages Board, 80, Pall Mall, London, S.W.1.

The scheme proposed by the Morpeth and District Nurserymen, Fruit Growers and Market Gardeners' Association, made progress at a meeting held in Newcastle on Friday, 16th May, when a small but influential gathering decided to organise a public meeting to be held in Newcastle on Friday, 13th June.

An Organising Committee has been appointed, consisting of Messrs. G. W. Purdy, Chairman, W. Y. Price, Secretary, G. Chalton, Assistant Secretary of the Morpeth Association, together with Messrs. Espey, Lowrison, Sanderson and Temple.

Further details can be obtained on application to Messrs. Price and Charlton, who will serve as Organising Secretaries, or from the Secretary of the Chamber of Horticulture, 11, Adam Street, Adelphi, London, W.C.2. The place of the Public Meeting will be announced.

The long felt need for some legislation to protect the interests of raisers of new varieties has occupied the attention of the Chamber of Horticulture for some time past. It now seems possible that progress towards a satisfactory result will be made. An eminent King's Counsel considers that it would be feasible to obtain the passing of an Act of Parliament, and to provide the means for doing this it is necessary to prepare a "case." Raisers are therefore asked to be good enough to place their views fully before the secretary of the Chamber at the earliest possible moment.

Obituary.

P. Sagourin.—The death is reported in the *Revue Horticole* of the French Director of Agriculture, Monsieur P. Sagourin, which took place on May 12. He was only 52 years of age, and the illness which ended thus fatally lasted but a few days.

Monsieur Sagourin, who had been director of Agriculture since 1916, played a considerable part in the organisation of food production during the last years of the war. An indefatigable worker, he strove passionately to further the interests of agriculture, and was mainly responsible for the creation of local committees and departments, a reform which played a very important part in the stimulation of agricultural effort during the period of greatest shortage. He was a most devoted worker, having filled in turn the rôles of professor in a technical school, professor of agriculture, local agricultural director of the Aube district, and agricultural inspector. His labours were everywhere productive of excellent results, and there is no doubt that French agriculture and horticulture is the poorer for his loss.

Edouard de Janczewski.—We learn with regret of the death, at what date is not recorded, of a well-known Polish botanist, Prof. de Janczewski. He was for some years Professor of Botany at the University of Cracow, and specialised in the genus Ribes. The results of his researches were published in 1907, in a work entitled "*Monographie des Groseillers, Ribes L.*," published at Geneva. Two supplements were subsequently added, bringing the work finally up to the year 1913. It is to be feared that his studies must have been seriously interrupted subsequent to that date, owing to the unfortunate circumstances which made this portion of Poland a battlefield, fought over again and again by the Russians and Germans. It is not reported, however, that the University buildings themselves have been seriously damaged.

CROPS AND STOCK ON THE HOME FARM.

MANGOLDS.

The early-sown Mangolds are coming through the soil satisfactorily, and directly the rows can be distinguished the soil on either side should be stirred at once either by the horse hoe or hand hoe. No plant I know shows the advantage of surface cultivation better than the Mangold, and none shows more forcibly the disadvantage of being smothered with weeds. I sow a handful of Barley with the Mangold seeds; this germinates in advance of the Mangolds, thus showing the lines much more plainly and making hoeing easier. Where Charlock is likely to be troublesome, I would advise strongly the early hoeing of the Mangold crop, as this pest robs the soil of fertility quickly and chokes the Mangold plants.

CABBAGE.

Seeds have germinated very well, but the Turnip fly is very troublesome and attacking the seedlings directly they appear, especially where the soil is rough. I find it a good plan to dust the plants repeatedly with soot, wood ash, fine bone meal, or superphosphate of lime, all of which will also assist the growth of the plants. In a small way, in the garden for example, one of the best preventives of Turnip fly attack is sprinkling the lawn mowings over the rows before the seedlings push through the soil. The sun will wilt the grass and the plants grow sturdily through it.

Wireworm is an especially bad pest this season, where grass, old Sainfoin, or leys were ploughed up last year. Oats and Wheat have been so badly attacked, and in some cases half the corn plant has been killed, in spite of the free use of sulphate of ammonia and repeated rolling with heavy iron rollers. Directly the Corn is cleared such land should be ploughed and repeatedly cultivated in order to expose the wireworms to birds. It will be useless to sow such crops as Mangold, Swedes, or even Potatos the following year if measure are not taken to destroy the wireworms.

MARKET CABBAGE.

Cabbages of the Wheeler's Imperial and Flower of Spring type are generally late in hearting this season, owing to the excessively wet autumn and winter. In large breadths of this vegetable there are very few "bolters," but in gardens where they were perhaps sown early there are many. Late plants would be improved by a light dressing of sulphate ammonia.

AUTUMN SOWN ONIONS.

These have grown quite well, and the spring sown batch, in the open, has germinated evenly and well. All that is needed now is to keep the soil stirred and free from weeds.

MAIZE, FOR COWS, CATTLE, PIGS AND HORSES.

In August and September Maize is a valuable food, especially during a spell of dry weather when grass is scarce, and not nearly enough of this fodder crop is grown. Some growers may have had failures with the crop owing to sowing the seed too early, or because rooks have destroyed the plants—which they may quickly do if allowed to taste the seeds when sown.

The middle of May is quite early enough for the sowing of Maize seed, especially in heavy soil. A stubble, ploughed in early autumn with a liberal dressing of farmyard manure, is a good preparation for Maize. Work the soil freely in the spring and sow the seeds six inches apart in the furrow behind the plough and not less than three inches deep. If farmyard manure was not available, sprinkle superphosphate of lime or bone meal with the seeds. Keep rooks away from the plot until the seedlings are well above the soil, when one hoeing will be all that is required.

ROLLING CEREAL CROPS.

The sowing season for such cereals as Barley and Oats has been especially prolonged this year owing to the inclement weather during the early months, when the preparations for these crops should have been made, consequently the rolling of these crops has been unduly delayed, in fact many fields have not yet been rolled. No time, therefore, should be lost in rolling, as the work is an absolute necessity in consolidating the soil about the plants as well as pressing stones out of the way of the binders.

SUMMER FALLOWS.

The present spell of dry weather is all in favour of work on summer fallows. This is an old-fashioned method of growing Wheat, and also a good one. There are many weedy fields at the present time that should be summer fallowed, which means repeated stirring of the soil, thus killing the couch and other weeds by exposure to wind and sun. Afterwards the weeds should be burned in small heaps, and the resulting ashes spread to enrich the soil with potash. The method of summer fallowing a field overrun with couch and other weeds, and which was ploughed out of an Oat stubble in the autumn and is now one mass of green, is to plough to quite the former depth, getting well under the couch roots, and crosswise of the previous furrows. A week later cultivate or scarrify the soil deeply by means of the tractor. The next business is to drag the surface and disentangle the soil from the weeds. Collect the weeds into heaps by the use of chain harrows used upside down. The next work is to again plough and cultivate, giving the weeds no rest. When thoroughly clean, plough the ground in July and sow with Rape to be eaten off in September and October by sheep, and then ploughed and sown with Wheat in October. An alternative method is that of sowing a catch crop of Mustard in August, allowing it to grow two feet high, ploughing it in, pressing firmly, and sowing with Wheat in October, or Winter Oats in September. Still another method remains, and it consists of ploughing and clearing the land until October, applying a dressing of farmyard manure of, say, 15 or 20 tons per acre, spreading it and ploughing it in, and sowing Wheat in October. *Ed. Molyneux.*

AGRICULTURAL WAGES.

A meeting of the Agricultural Wages Board was held in London on May 9, Sir Ailwyn Fellowes presiding.

The Board appointed a Committee to consider and report upon the suggestions made at the Conference held on the 7th May between the Board and representatives of all the Districts Wages Committees for the discussion of matters relating to the work of the Board and of the District Wages Committees.

After consideration of the objections which had been lodged to their proposal of the 1st April to vary the minimum rates of wages for male workers of 18 years of age and over throughout England and Wales, and of the reports made on the proposal by the various District Wages Committees, the Board decided to confirm their proposal except as respects ordinary labourers in Cumberland and Westmorland (in regard to which the District Wages Committee will again be consulted), and as respects the special rates for special classes of workers such as stockmen, horsemen and cowmen, in Herts., Kent, Middlesex, Northants., Salop, Surrey, Sussex and Wilts. In the case of these counties the Board propose that the special classes of workers shall be paid at the minimum and overtime rates applicable to ordinary labourers.

The variation made by the Wages Board (which came into operation on the 19th May) is as follows:—

(*a*) A reduction in the hours for which the minimum wage for ordinary labourers is payable to 54 in "Summer" and 48 in "Winter," in the counties where such hours have been in excess of these hours.

(*b*) An addition to the weekly wages at present payable to ordinary labourers, of the following sums (subject to slight adjustment to round sums):—Workers of 18 and under 19 years of age, 3s. a week; workers of 19 and under 20 years of age, 4s. a week; workers of 20 and under 21 years of age, 5s. a week; workers of 21 years and over, 6s. 6d. a week; with corresponding adjustments of the overtime rates on the basis of time and a quarter on week-days and time and a half on Sundays.

In the case of those counties where the number of hours per week are in excess of 54 in summer and 48 in winter, the above additions will be made, not to the present weekly wages, but to the present weekly wages reduced to a basis of 52 hours all the year round.

(*c*) An increase in the special rates fixed for special classes of workers such as horsemen, stockmen and shepherds, by amounts corresponding to the increase in the rates for ordinary labourers, except as regards the eight counties referred to above.

The Wages Board have at present under consideration the special rates for horsemen, stockmen, shepherds, etc., with a view to modification of the basis of "customary" hours for which those workers are paid in a number of counties, but they were not legally in a position to give effect to any alteration in this basis at the moment, and they consider that in the meantime these workers should not be deprived of the increase granted to other workers, even where it involved making a new rate which may only be in operation for a short time.

A Schedule of the new minimum rates fixed for each county will shortly be obtainable on application to the Agricultural Wages Board, 80, Pall Mall, S.W.1.

ANSWERS TO CORRESPONDENTS.

ADDRESS WANTED. Will Mr. J. Tayleur, of Theale, Berkshire, kindly send us his full address, as a letter sent as above has been returned "Not known."

BLACK CURRANTS: *J. P.* The bushes are badly affected with big bud mite, Eriophyes ribis. Considerable correspondence on this subject has been published in recent issues of *Gard. Chron.*, and in the one for March 29, 1919, Mr. G. Taylor stated that the mite may be controlled by using a mixture consisting of 10 per cent. of soap and 5 per cent. of crude carbolic acid. Pick off all the affected buds and burn them. The spraying should be commenced about the beginning of April and continued once weekly until the first week in June.

CINNAMON VINE.—*M. A. H.* Cinnamon Vine is the popular name for Dioscorea, the members of which are twining herbs, grown largely in America for furnishing arbors, pergolas and the like. Certain species of Dioscorea are cultivated in this country for their handsome foliage. There are several species, but we doubt if they would prove a great success in this country out-of-doors, seeing that they are natives of warm countries.

COST OF NICOTINE. *R. A. C.*: We have sent your letter to *Market Grower*, who states that the nicotine he referred to on p. 223 was bought last October, when the actual quotation was 15s. 3d. per lb. carriage paid for a 50-lb. lot. A little later nicotine was practically unobtainable at any price. The Yalding Manufacturing Co., Maidstone, sell a nicotine substitute which is rather cheaper.

CULINARY AND DESSERT APPLES.—*C. H.* Assuming you propose to plant bush trees in the autumn, the following varieties of Apples will be found suitable for your district: Culinary—Lord Grosvenor, Grenadier, Ecklinville Seedling, Rev. W. Wilks (early); Bismarck, Lord Derby, Blenheim Pippin, and Stirling Castle (mid-sum.); Newton Wonder, Lane's Prince Albert, Bramley's Seedling, Annie Elizabeth, Beauty of Kent, and King Edward VII. (late). Dessert—Lady Sudeley, Beauty of Bath, Irish Peach, Devonshire Quarrenden (early); Cox's Orange Pippin, King of the Pippins, Allington Pippin, American Mother (mid-season); Adams's Pearmain, Sturmer Pippin, Barnack Beauty, Claygate Pearmain, Lord Hindlip, and Duke of Devonshire.

DIPLOMA IN HORTICULTURE.—*R. H.* You would be able to obtain full information and probably copies of papers set at previous examinations from the Secretary of the Royal Horticultural Society, Vincent Square, Westminster, London, S.W.

HARDY AZALEAS.—*J. L.* It is probably that the larger, wider flowers of Azalea mollis, of the Anthony Koster type, represent the true variety, whilst the smaller yellow flowers represent Azalea pontica (Rhododendron flavum). The former has, we assume, been grafted on the latter, and the stock has sent up a growth which has flowered among the growths of the grafted variety.

HIPPEASTRUM: *J. O.* The painting of the Hippeastrum (Amaryllis) forwarded for inspection is a seedling or hybrid from A. Vittatum, a species introduced from the Andes of Peru more than a century ago. The hybrids are very showy but lack the form, size and substance of those of newer varieties, and are scarce in collections.

NAMES OF FRUITS.—*A. N.* Probably a shrivelled fruit of Fearn's Pippin.

NAMES OF PLANTS: *North.*—1, Phyllera augustifolia; 2, not recognised; 3, Epimedium pinnatum; 4, Kalmia augustifolia; 5, Pernettya mucronata; 6, Megasea crassifolia; 7, Trillium sessile; 8, Luzula sylvatica; 9, Tiarella cordifolia; 10, Ledum latifolium; 11, Petasites fragrans; 12, Vaccinium mystillus; 13, Gaultheria Shallon. *G. J.* (1) Pilea muscosa; (2) Streptosolen Jamesonii; (3) Megasea cordifolia; (4) Choisya ternata; (5) Veratrum sp. (send when in flower); (6) Doronicum austriacum; (7) Asphodelus ramosus. *S. B.* Veronica gentianoides and Asphodeline lutea. *W. M. M. D.* (1) Cypripedium Lawrenceanum; 2 and 3 are probably varieties of or hybrids from C. Lawrenceanum. *H. B. R.*—Orobanche major. *W. V. de W.*—Begonia semperflorens gigantea. *F. H.*—Asphodeline lutea. *E. J. R.* Prunus Padus. *A. B.* Cyphomandra betacea, the Tree Tomato; quires a warm greenhouse temperat *A. H. P.* Prunus Padus. *H. G.* Dor cum plantagineum. *L. A. M.* (1) Chry gonum virginianum; (2) Lithosperm purpureo coeruleum; (3) Lathyrus ver albus; (4) Primula japonica; (5) Ph divaricata; (6) Primula farinosa; (7) Po monium coeruleum; (8) Euphorbia Cyparis *C. W.* (1) Prunus Padus; (2) Pyrus t minalis; (3) Olearia elaeagnifolia; (4) Symp tum tuberosum. *C. H.* (1) Euphor epithymoides; (2) Exochorda grandiflora; Camassia esculenta; (4) Cornus Nutallii; Staphylea colchica. *L. C.* Bocconia cor

PEAR LEAF BLISTER MITE.—*West Derby.* Pear leaves and fruitlets are attacked b Pear-leaf Blister Mite (Eriophyes pyri). mite inhabits the buds during the winter, is said to migrate to the leaves during summer. It is certainly responsible for blisters on the Pear leaves, and also on the bryo fruits of susceptible varieties like Souv du Congrés. The damage on the young fr gradually disappears as they increase size, though the severely affected ones usu drop. Summer remedies are not usually succ ful, the best time to attack the pests be early in March, just as the buds are open At this period the mites which have shelte during the winter under the bud scales accessible to sprays. Lime sulphur at a wi strength of one in twelve, or one in fifteen harmless to the Pear and destructive to mites.

SHELTER BELT FOR FRUIT TREES: *R. H. L.* T rows of trees will suffice for the shelter b For the inner one, next the fruit tr Cupressus macrocarpa would be suitab This is an evergreen, very dense in habit, grows rapidly. If the Austrian Pine thrives your locality, this Conifer would be suit for the outer row. If it is unsuitable, Ca dian Poplar might be substituted. Plant trees 10 feet apart in both rows, with th in the outer row opposite the spaces in inner row. The distance between the ro should be about 12 ft.

SOIL ANALYSIS.—*W. B. W.* Dr. J. Augu Voelcker, No. 1, Tudor Street, New Br Street, London, E.C.4, undertakes the ana of soil for a fee. If you are a Fellow of Royal Horticultural Society he would do s a special rate of charges, which may be obta from the Secretary of the Royal Horticult Society, Vincent Square, Westminster, Lo don, S.W.

WEAK GROWTHS ON LADY DOWNES' VINES: *W.* There is a lack of substance in the growth your vines which points to a deficiency of or more of the essential minerals—lime, p phate or potash—in the soil; while the coloration and large amount of pith sug that an excessive quantity of nitrogen has be applied. If no lime has recently been giv apply 10 lbs. to the rod, after slaking it allowing it to cool. A dressing of wood a burnt vegetable refuse, spread over the surf a quarter of an inch thick; kainit, 4 lbs. to t rod; or sulphate of potash, 2 lbs. per would supply the necessary potash. Sup phosphate at the rate of 6 lbs. to the should be applied for immediate assimila followed by a similar quantity of bone meal steamed bone flour. In some soils, bones, cepting in the form of powder, are usel owing to their slow decomposition. You sho be able, by the knowledge of what has be applied to the vine borders, to judge which the above substances are necessary. No ni genous manure should be given this season, if there is a mulching it should be remov and followed by an immediate application such manures as are likely to supply th elements of which the soil is deficient.

MARKETS.

COVENT GARDEN, May 28.

[We] cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

[RE]MARKS.—The supplies of cut blooms are again shorter. [...] white flowers are becoming dearer. Choice blooms [are] very limited. Narcissus Poeticus is finished for the [seas]on. Double white Narcissus, although in plenty last [wee]k, remained firm in price. Enquiries are already being [made] for double white Pyrethrum, the first arrival of which [is e]xpected this week. Coloured varieties are already [offer]ed, both double and single, and are selling freely. Other [...] subjects consist of Paeonies, Cornflowers, Nigella, [...]ve Statice and White Daises. Iceland Poppies are [...] plentiful, but their prices remain unchanged. Roses [conti]nue to be well supplied, but the majority are very [...]or blooms. Carnations are also reduced in quantity. [Gard]enias are more plentiful and offered at cheaper rates. [Fo]liage, with the exception of Smilax, is much cheaper.

Fruit: Average Wholesale Prices.

Supplies of Grapes are increasing daily; the most common varieties are Black Hamburgh and Muscat of Alexandria. The following are also obtainable in large quantities:—Strawberries, Melons, Figs and Peaches. Nectarines are now commencing to arrive, and green Gooseberries are becoming much more plentiful. There are about 300,000 boxes of Tasmanian Apples to hand, per S.S. "Somerset," containing from 36 to 40 lbs. each. There is also a fresh consignment of Pineapples to hand. Tomatos, Cucumbers and Vegetable Marrows are not quite so plentiful as they were last week, but Beans and Peas show an increase in supply. Heavy supplies of English Asparagus are reaching the market daily.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

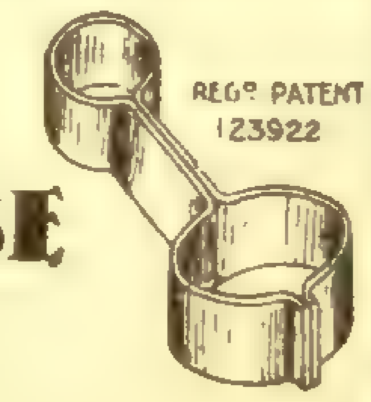
DUTTONS' NOTED CARNATIONS.

STRONG PLANTS NOW IN 3½ in. POTS. *LIST FREE.*

A. F. DUTTON, LTD., IVER, BUCKS.

This is the **ENTERPRISE** *clip bracket*



introduced for the Purpose of training or supporting Vines, Creepers, Tomato Plants, Plants and Cuttings of all Varieties

IT DOES AWAY WITH THE old way of tying with string: often detrimental to the plant. All it is necessary to do is, place the clip on stick at the desired spot and place plant in clip. As the plant grows the clip can be moved on stick. Made in various sizes for different sized sticks.

Nurserymen, Gardeners & Amateurs will find this clip bracket most useful and labour-saving—in fact, it combines work with Pleasure, Ease and Comfort.

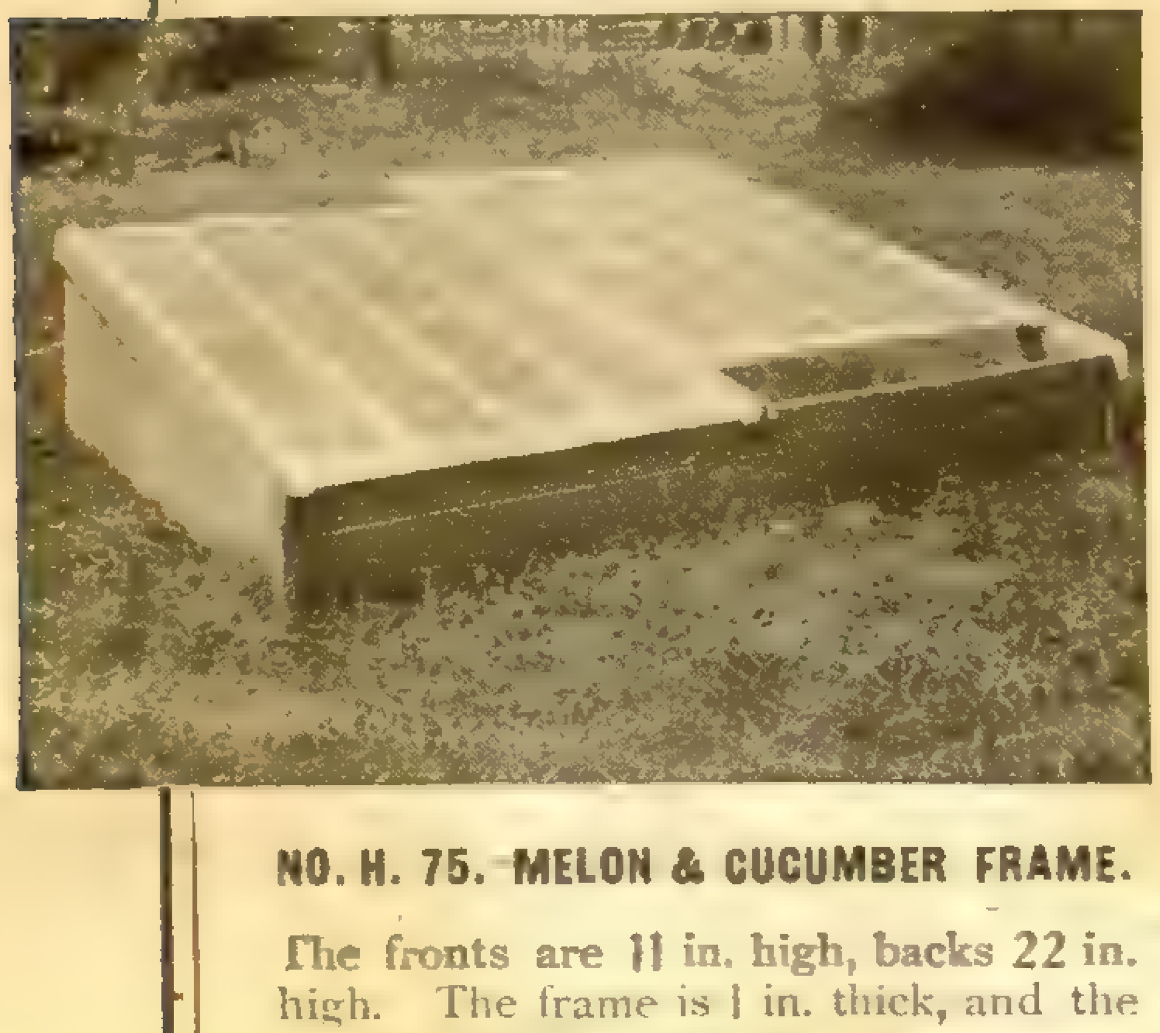
Have the Best of Garden Frames

Built to last—soundly constructed of selected and seasoned materials, of the latest designs—these Garden Frames are, like all products of Boulton & Paul, the best available at the lowest possible prices—consistent with sound workmanship. The great resources of this century-old firm are fully utilised in making these frames, just as in great Conservatories and Horticultural Buildings of their Construction. As the stock is limited and the demand large, early orders are advised.



NO. H. 75. MELON & CUCUMBER FRAME.

The fronts are 11 in. high, backs 22 in. high. The frame is 1 in. thick, and the lights 1½ in., glazed with 15 oz. glass, and painted two coats.

1 Light Frame, 4 ft. by 6 ft.... £4 4 0
2 Light Frame, 8 ft. by 6 ft.... £6 3 0
3 Light Frame, 12 ft by 6 ft.... £8 4 0

These are in stock ready for immediate delivery.

Carriage Paid to any station in England and Wales.

Write for our List of Garden Frames and Small Greenhouses.

Enquiries invited for Heating Systems, Conservatories, Vinery Ranges, Peach Houses, Carnation Houses, Garden Frames, etc., of all descriptions, with requisite accessories.

NO. 80. ALLOTMENTS FRAME.

The ideal for Allotment Holders. Size, 4 ft. 9 in. by 3 ft. 9 in. Sides, 9 in. high.

Price 44/-

Painted two coats and glazed with 15oz. glass. Frames also supplied in other styles and sizes.

CROWN CANKER IN ROSES.

THIS disease has in the past few years become rather widely spread in Rose gardens, and by reason of its infectious character and the difficulty experienced in treating it satisfactorily, it requires serious attention from lovers of Roses.

It is usually first discovered at pruning time, when one or more of the older branches are found to have died down to the base, and the bark just above the insertion of the bud, instead of being hard and sound, is pulpy and soft. This diseased bark is often swollen and more or less split longitudinally, and in extreme cases splits off all round the stem. Young growths have generally been found below the diseased portion, and these again became infected in the following year. The plant becomes increasingly less satisfactory and the flowers poorer in size and quality, and if the disease is not stopped the plant ultimately dies altogether. The plant, however, will often live for some years after being attacked before it finally dies.

If the split bark is examined under a lens, little strands of the mycelium of the fungus may often be observed looking like little bits of cobweb running into the bark. This mycelium produces little receptacles, containing spores, which burst the bark, and, forcing their way through it, discharge their spores, which are carried to and infect other plants, and by this means the disease is spread.

The injuries to the bark caused by the fungus are frequently situated on the stem near to the surface of the ground, but this is not always so, for they may often be found some distance up the branch; on standards they are generally found near and just above the point of insertion of the bud.

These injuries sometimes occur in only one or two places, and in others extend right round the branch, and then the bark is often split off from the wood all the way round as though the branch had been ringed. Prof. M. L. Massey tells us that these injuries may also be found upon the roots, but I have not actually observed this myself.

In the autumn I have often found little toadstools about an inch long, of a faintly greenish brown colour, growing out of the affected plants near the root. These little toadstools can scarcely be another form of the fructification of the disease, and must, I think, point to another fungus which has found its way into the diseased tissue.

Although the stage in the disease which I have described is that in which it is usually first noticed by the amateur rosarian, the beginning of the disease is somewhat different. I take the description of this stage from Mr. George Massee's *Diseases of Cultivated Plants*, p. 415:—"The disease commences on the one-year-old wood, and its presence is revealed by small reddish patches scattered over the green bark. At a later stage minute cracks appear at the injured points, and gradually continue to increase in size. At this stage the formation of callus begins, the cells of which are in turn attacked by the fungus, consequently the callus continues to grow and form large nodulous masses which may extend for many inches along the branch, forming the well-known canker."

The first reference to the disease that has come under my notice is contained in an article by Dr. Cooke on the "Pests of the Flower Garden" in vol. 27 of the *R.H.S. Journal*, p. 45 (1902). Under the name of Rose Tumour, which he calls Botryosphaeria diplodia (Moug), he describes and figures the early stage of the disease. He describes the sporidia, however, as "almond-shaped and colourless, or tinged with yellow," without mention of the black cases or perithecia in which they are contained, but I think he must be dealing with the same troublesome pest of which I am writing.

In 1909 Mr. George Massee, in the *Rose Annual*, described and illustrated the disease described by Dr. Cooke under the name Briar Scab without mention of the later form taken by the disease, which may perhaps throw some doubt on its identity. In the same year I gave an illustration in the *Rose Annual* of a plant of White Maman Cochet attacked by the disease, which I then attributed to the effect of frost. We had experienced a severe frost and fall of snow in the April previous, after the plants had begun to grow, and I then thought this might have been the cause, and I notice that Prof. Sorauer (*Zeitschr. Pflanzenkr.*, 17, p. 22) had thought the disease to be primarily due to frost. I feel now, however, fairly satisfied that the plant of which I gave the photograph was quite typical of one affected by the disease.

In vol. 34 of the *R.H.S. Journal*, p. 222, entitled "Parasitic Rose Canker—A New Disease in Roses," H. T. Güssow gives a detailed description of the disease, very fully illustrated, and calls the fungus Coniothyrium Fuckelii, which name is also adopted by Drs. Lambert and Schwartz in their book, *Rosenkrankheiten*, published in 1910. These authors refer to the serious character of the disease, and suggest that it deserves more careful study than it had received. The remedy suggested is the careful removal and burning of all affected parts of the plants.

In his *Diseases of Cultivated Plants*, also published in 1910, Mr. George Massee describes the disease, and advises the dressing of the wounds caused by the removal of the diseased stems with tar.

Prof. M. L. Massey has taken up the subject in the American *Rose Annual* for 1918, p. 64, and again in the same Annual for 1919, p. 74, the latter article dealing chiefly with the effect of the disease on Roses under glass. He thinks moisture plays an important rôle in the severity of the disease, and suggests the removal of the soil from round the crown of the plant; but the disease is not confined to the part near the soil and its occurrence in standards seems to make this remedy a doubtful one in this country. In his later article he describes it as a soil disease, and states that infected soil may remain dry for months without killing the mycelium, though the spores are killed by drying for 15 days. Frost does not kill the fungus, but it may be destroyed by heating the soil to 122° F. for 10 minutes or treating it with formalin (1 pint to 25 gallons) at the rate of two gallons per cubic foot. Careful disinfection and sanitary measures appear to be the methods on which he relies to combat the disease, which he is still investigating. He has acquired much interesting information about the fungus; thus he has measured the rate of the progress of the mycelium through soil, and we may hope he will in time discover an effective remedy for curing affected plants, which he at present advises should be destroyed.

In one case, in my own garden, I found the disease apparently ceased after some years when I raised the affected batch of plants by planting them rather higher in the soil. I think, however, that the benefit of transplanting lay chiefly in the facility it afforded for the removal of all diseased tissue, and I doubt whether in most cases it would be found to be worth while.

The disease is still obscure. At one time a plant seems to suffer little from an attack, at others it will be destroyed in two or three years' time. The acidity or alkalinity of the soil seems to make little difference, and the careful destruction of all affected parts is the only thing we can rely on until more is known of the life history of the fungus. Unfortunately, it seems to increase best at the temperature most favourable to Rose growth. *White Rose.*

NOTES ON IRISES.

IRIS HOOGIANA.

THIS recent introduction (see Fig. 139) was discovered, I believe, in Turkestan in 1913 by a collector working on behalf of the firm of van Tubergen, of Haarlem, and is, to my mind, by far the best addition that has been made for many years to the known species of the genus. It is obviously a member of the Regelia section, and therefore closely allied to I. Korolkowi and I. stolonifera, though it is curious to find a species with flowers of such pure colour in a section which is otherwise remarkable for the veining and contrasting colours of its flowers. The rhizome, with its slender, running stolons, is characteristic of a Regelia Iris, and, if it differs at all from those of the other species, the difference lies chiefly in the fact that it remains dormant in spring until several weeks after the shoots of the other species have appeared above the surface. Then, however, it grows so fast that, with the exception of the rare I. Suwarowi, which is seldom seen in cultivation, it is the first Regelia Iris to come into flower, though its stems grow nearly three feet in height and thus overtop the others.

Each stem bears either two or sometimes three flowers, which open in succession. The colour is apt to vary a little in each individual plant. In some it is the very faint blue of the sky on a sunny summer day, but in others it is many shades darker, and sometimes there is a distinct tinge of reddish purple. Perhaps it may help to say that the colour varies as it does in Iris pallida. The pale colour of I. pallida dalmatica is approximately that of the palest I. Hoogiana, though I can hardly say that any I. Hoogiana has yet appeared with flowers as dark as those of my darkest pallida seedlings. As we might have expected, a white form appeared among the collected plants, so Mr. Hoog tells me, though it is weaker than the purple-flowered forms. No example of it was, unfortunately, among those that I received, and I have not yet seen a flower. Of white pallidas I have now at least three seedling forms, even if I have lost, as I am afraid may be the case, the piece of the wild white pallida of which I found a flowering plant on the hills near Ragusa on the Dalmatian coast.

The beard of I. Hoogiana is remarkably thick behind, and then narrows gradually to a sharp point in front on the blade of the fall. It consists of closely-set golden hairs, which in the darker forms are sometimes slightly tipped with a colour so dark as to be almost brown. The standards are strongly bearded on the inner side.

This Iris was originally described in *Gard. Chron.*, Nov. 4, 1916, p. 216, as closely allied to I. Korolkowi and I. stolonifera, and this is undoubtedly the case. Its rhizome is that of the latter, and not that of I. Korolkowi, which is more compact, but I am inclined to think that herbarium specimens of I. stolonifera and I. Hoogiana, in which the flowers were badly crushed and had lost their colour, would be indistinguishable. This is one of the few cases, apart from the Onocyclus group, in which two closely-allied species of Iris cannot be readily distinguished by some structural feature. Of course, we may take the absence of veining in the flowers as a stru-

tural difference, and this is certainly remarkable, but only, I think, at first sight, for on closer inspection it will be seen that the veins are there but so faint as to be practically invisible. One of the features of I. stolonifera is the way in which the blue colour is suffused over the brown-purple ground. In I. Hoogiana in some cases there is a delightful suffusion of opalescent tints of green and brighter blue over the central portion of the falls and on the outer side of the standards.

Yet in spite of the close resemblance—apart from colour—between the two species, I am quite convinced that I. Hoogiana is a good and distinct species, for which there should be a great future in store, if only those who grow it will take up their plants about the middle of July and replant them early in October. For years I have been in the habit of taking up Regelia Irises early in June, but now I am sure that the new growths were not then mature. Consequently they did not flower well in the following season. Now, however, that I leave my plants untouched till July, I am rewarded with crowded flower stems. Last year I was pleased when I counted 36 stems of I. Hoogiana, but this year there are over 200, and these have come from a small patch of collected rhizomes which filled in 1914 about one square yard of a bed. Now I am overrun with I. Hoogiana, and have no hesitation in recommending it not only as one of the most striking of all Iris species, but also as one with an excellent constitution. *W. R. Dykes, Charterhouse, Godalming.*

FIG. 139.—IRIS HOOGIANA; COLOUR OF FLOWER PALE BLUE.

LETTERS FROM SOLDIER GARDENERS.

FRUIT AND FRUIT TREES IN MACEDONIA.

MANY times I have longed for a good English Apple since I came to this country. The very first fruits I saw after landing were Apples of a sort. On the way up from the docks to the Base Depot we espied a Greek with a donkey carrying two pannier baskets, and he signalled to us, exhibiting for sale some small Apples. Several men broke the ranks and went across to him. They had all bought a good many when the R.S.M.'s eye fell on them. The whole battalion was halted, and the great man went across to the offenders. The Greek and his donkey vanished promptly, and the Apple buyers were made to cast their purchases on the ground and rejoin the ranks. From what I could see of the fruits they were little superior to Crabs.

Since then I have not seen an Apple, though I know where there are several trees. In fact, I saw them in full bloom in the Spring, and very handsome and homely they looked.

Pears, on the contrary, are common everywhere, wild trees, some of them bearing enormous crops of fruit, growing to a goodly size. In appearance the Pears resemble the English Lammas, and ripen about the same time, but they are not so sweet. They are just eatable, and that is all. We have had some much larger Pears issued as rations at times, and I suspect these came from the Struma Valley, where fruit, I understand, is abundant. Quinces, too, were issued "in lieu of jam" very freely last summer. In England I should never have thought it possible to eat a dish of stewed Quinces. One in an Apple tart was well enough. These, however, were passable and without the roughness of English Quinces. Often they were very large fruit. I came across odd trees in several ruined and deserted orchards.

Other typically English fruits I have seen and tasted sparingly include yellow Plums, Cherries—white and rather poor—and Apricots. At one place among the hills, where the villagers had been allowed to remain, there were fairly large orchards of these trees, and the fruit was ripe quite early in July. Previous to that we had seen scarcely any fruit whatever. I found some wild Strawberries, rather larger than English ones, darker in colour and sweeter, and by the end of July Sloes, which are very abundant and of large size, were fully ripe.

The outstanding treat we had in fruits was provided by Mulberries. Wherever there is some shelter from the biting Vardar wind, there are sure to be Mulberry groves. The trees are grown for rearing silkworms, and are ordinarily pollarded to produce an abundance of leaves, but since the war began silk-production seems to have been entirely stopped, and the trees have grown up to a considerable height. Last year I was able to go daily during the early part of June to a large orchard, and feast to my heart's content. It was, in fact, one of the most delightful experiences I have had in this country to wander alone in the cool of the groves, picking the ripe fruits as I fancied them, watching the strange insects flitting through the trees and the tortoises greedily devouring the fallen fruit. Although pleasant to the taste, the Mulberries lacked the piquancy of English fruits, and were inclined to be sickly. This applies to the black variety. The white variety is better flavoured.

It is rather an odd thing, but though most things out here are a month earlier than in England, Blackberries do not become edible until quite late in the year. This is no doubt accounted for by the dryness of the air. It is not until the middle of September that there is any appreciable amount of moisture, and certainly last year I could not find a palatable Blackberry until the last week in that month. Throughout October and well into November fine fruit was abundant, particularly on bushes growing in ravines where the sun was shut out during part of the day.

So far as my experience goes, these are all the English fruits one finds here, and we would be poorly off in the autumn were it not for the Grapes. It would be a strange house which had not literally its "own vine and Fig tree." (How the meaning of these familiar old expressions comes home to us after a sojourn in these countries!) Vines of great age are found in almost every garden, planted just outside the deep verandah and supported so that they partially screen the verandah. Any overgrowth is trained into a rough arbour, which gives a pleasant shade if one wishes to sit outside the house. Practically all these vines bear white Grapes of moderate size. Beyond the rough training, nothing is done to them in the villages I have visited. Probably there are in Salonica professional gardeners or well-to-do people who give better culture and grow finer sorts, but my lines have fallen among the remote, poor villages where things seem as unchangeable as the hills about them. At any rate, these Grapes are pleasant things in the heat of August, and last year, at least, there was no lack of them. In places, there are extensive vineyards, now utterly neglected, where the so-called Currants and Raisins are mainly cultivated. The most common liquor of the country, "Samos," is, I believe, made from Raisins, but a very palatable red wine is also obtainable—not so freely, however, as in other Mediterranean countries. Wild Grapes, too, one finds growing commonly enough, but birds are too numerous to permit the fruit to ripen to any extent.

Figs are ubiquitous, wild and cultivated. No garden is without one or more Fig trees, and there are orchards with large numbers of immense trees almost everywhere. The fruit is

at its best about the last week in September, and is very delicious. As with the vine, little cultural attention is given, but there seems always to be plenty of fruit, and the drying and stringing of it is quite a business in certain villages. Throughout the winter a string of about 60 fine Figs can be bought for a drachma, and from time to time an "issue" of Figs provided a welcome change for the troops.

Pomegranates are plentiful in most village gardens, and these are, of course, an oriental feature which one notices more than the Figs. These trees vary a good deal in size, but those in full bearing are about 15 feet in height. The leaves, which remind one of those of the Box, are noteworthy as having a very rich autumn colouring and persisting on the trees long after other deciduous plants have shed their foliage. The blossom begins to appear in June. There never seems to be a great deal, just a few scattered about the bush, but the brilliant scarlet is very striking and beautiful, as is also the waxy appearance. As the fruit swells it loses its rich colour and gradually becomes a dull brown until the time of ripening, when it assumes the yellow and rose colour familiar to every schoolboy. A Pomegranate tree laden with fine fruit is certainly a handsome sight.

I suppose the Melons issued to the troops in the autumn were from the Struma valley. They were certainly fine fruits. The varieties are numerous, but I think the best I ever tasted was a small kind not larger than a good sized Orange. It had yellow, fluted skin, white flesh and white seeds, some of which I sent home to a gardening friend, but having heard nothing of them to date, I am disposed to regard them as "presumed lost." I have not seen many growing, but here they seem to give little trouble. The natives sow them, as well as Gourds and Marrows, in the Maize fields, putting in a plant here and there. They dig a shallow hole and fill it with ashes, of burnt cow-dung mostly. In this they put the seeds and apparently do nothing further. It astonished me to find these plants, which I have always regarded as water-loving, doing so well in a dry climate, and, oddly enough, in every Army garden where attempts have been made to grow them, they seem to thrive indifferently, in spite of copious watering. One needs to "wait and see" before assuming that English methods are superior to Macedonian when employed in Macedonia, as I have learnt in other directions. *Herbert Mace.*

TREES AND SHRUBS.

STYRAX JAPONICUM.

This beautiful small tree (see Fig. 140) was originally introduced to this country by Richard Oldham, in 1862, when he was collecting for Kew in Japan and Corea. But it is likely that most of the older trees in our gardens originated from the Coombe Wood Nursery of Messrs. J. Veitch & Sons, for whom it had probably been sent home by J. G. Veitch. One of the happiest memories of that ever-to-be-remembered nursery is of a tree growing near the road half way down the slope, which used to flower profusely every June. To stand beneath its branches then and look up at its myriads of tiny, pure white bells was an experience not to be forgotten. This tree is not, in fact, to be seen at its best until it is high enough for its flowers to be seen from underneath. Being pendent and ranged on the underside of the branches, they are apt to be hidden from above by the foliage. In growing the tree therefore, it is desirable to train it up to a leader and gradually remove the branches from the trunk until the lowest is on a level with the eye-line. Sargent records his having met with it in Japan 20 to 30 feet high.

Fig. 140.—Styrax japonicum; flowers white.

Like many other Japanese trees and shrubs it has the habit of pushing out its branches in a horizontal direction and it is copiously leafy. The leaves are lozenge-shaped or narrowly oval, rich green, ranging from 1 to 3 inches in length and about half as much wide; except for some tufts of down in the vein axils beneath they are glabrous. The flower has five pure white petals, downy on the outer side, and is borne on a slender, pendulous stalk, three to five flowers in a lax panicle. The fruits are egg shaped, about ½ inch long, covered with a close grey down, and they are usually produced abundantly enough to make a noticeable and pleasing feature in the autumn.

The tree is perfectly hardy, but as the flower buds appear with the young growths in April they are, in early seasons especially, liable occasionally to be injured by late spring frosts. Bleak open sites should be avoided when planting. It will thrive in either loamy or peaty soil provided the drainage is good. *W. J. Bean.*

BUD SPORTING IN TREES.

So far I have never seen a fastigiate variety of Quercus rubra, but in a western suburb of London I have noted there is a possibility of getting one. A street tree of this species has given rise to three or more upright branches from a nearly horizontal one, and these have in their turn given rise to twenty or more ramifications as upright as the original ones. Very possibly they will all get cut away if the tree is subjected to pruning or lopping. Two trees of Crataegus Oxyacantha flora plena punicea have given rise to branches bearing the rosy pink flowers of C. O. flora-plena rosea. More frequent are the trees of Acer Negundo variegatum that bear branches furnished with creamy white leaves that have no chlorophyll in them, and must be entirely supported by leaves on other branches containing chlorophyll. *J. F.*

KERRIA JAPONICA FLORE PLENA.

The fine display of bloom given this spring by this old-fashioned shrub (it was introduced more than two centuries ago) impels me to write a few lines on its behalf. It would seem to have fallen somewhat out of favour, for one seldom sees it now. In the old garden I have in mind it is at the present date (May 19) smothered with its orange-yellow rosettes; and I imagine it has benefited from war-time neglect. The gardener has not been able to use his knife so freely and

to train so tidily as of yore. The specimen is growing against a north wall, and has been there at least half a century, and possibly nearer a century. It never fails to flower profusely in this situation. Treated as a wall subject, well spread out, and with little pruning, it is one of the best flowering shrubs or climbers (if we may allow this term in the horticultural sense) for a north aspect or a shady corner unfitted for a choicer plant. Usually one looks for its orange blooms towards the end of April, but owing to the unfavourable weather of spring it was a fortnight late in flowering this year.

In Nicholson's *Dictionary of Gardening* the height attained by Kerria is given as 3 ft. to 4 ft. The double variety here, on the house wall, reaches a height of 12 feet or more, and is quite capable, if allowed, of peeping into the bedroom windows.

The double Kerria is readily increased by suckers, and soon establishes itself in a new situation. Those requiring a shrubby plant for a north wall, that will give a maximum of bloom for a minimum of attention should choose Kerria. I speak, of course, for the North-West of England. Whether it does so well in the drier parts of the country I cannot say. It would seem to delight in much moisture, and be capable of flowering well with a modicum of direct sunshine. The double Kerria is generally classed as a shrub that flowers throughout the milder months of the year. Here, it does bloom again to some extent in the autumn, and may not be without flowers in the summer; but it is really only showy, and it is strikingly so, in the spring. I am not well acquainted with the single form, but if it is capable of flowering in the same splendid way it should be more graceful in appearance. Specimens of the single form I have seen looked rather meagre and insignificant. *J. P., Carlisle.*

DOUGLASIA.

A member of the Primula family, the genus Douglasia is closely allied to Androsace, and in general habit and appearance the species in cultivation at the present time very much resemble many of the members of that choice genus of Alpine plants. There are five species of Douglasia, one of which is found on the European Alps, while the others are natives of North America. All the American plants bear rose-purple flowers, the European one alone having yellow blooms. The following species are, or have been, in cultivation :—

D. LAEVIGATA (see Fig. 141).—This plant was introduced by means of seeds received from Dr. Gray in 1886. Plants flowered in April, 1888, when the species was figured in *Bot. Mag.*, t. 6,996. It was again introduced by Messrs. Bees, Ltd., early in this century, and was exhibited at a meeting of the Royal Horticultural Society on April 1, 1913, when it obtained an Award of Merit. It is a dense-growing, tufted little Alpine, with closely-packed rosettes of narrow, pointed leaves, forming a compact cushion. The rosy-purple flowers, each one-third of an inch in diameter, are borne in clusters of 2-5 together on stems about one inch long. A native of the Alps of Oregon, in North America, the plant is usually found growing wild in the clefts of rocks near the summits of the mountains. In this country it grows freely in open places, planted in peaty, well-drained loam; the roots need plenty of moisture during the growing season.

D. NIVALIS.—This species was in cultivation in this country early in the last century, but is not at the present time. It is a taller growing plant than the above, with rosettes of linear, obtuse, hairy leaves. The pink flowers are produced in sub-umbellate clusters on stems three to four inches high. D. nivalis is found on the Rocky Mountains at an elevation of about 12,000ft., and is a charming little plant well worthy of reintroduction.

D. VITALIANA.—Also known under the names of Androsace Vitaliana and Gregoria Vitaliana, is the only European member of the genus. It is of low growing, tufted habit, forming a carpet of grey-green foliage studded during the early summer with rich yellow flowers. In the rock garden, planted in well-drained, gritty loam, the plant grows freely, but does not always produce its flowers so abundantly as one would desire. It is usually found growing in a shaley mixture that contains little soil, but which gets abundant moisture from the melting snows. Later in the year, when it has completed its growth, the plant becomes thoroughly ripened. In this country an open, sunny situation on a rocky ledge or moraine is desirable. Like the two other species, D. Vitaliana may be propagated by means of division after flowering, and from cuttings inserted in July, while all may be easily raised from seeds sown in spring. *W. I.*

FIG. 141.—DOUGLASIA LAEVIGATA : FLOWERS ROSY-PURPLE.

The Week's Work.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Leeks.—The hardy and important Leek crop should be grown more largely than it is as the season of usefulness extends from October (or earlier) until May. Trenches are possibly the best means of cultivating Leeks for autumn use, but for the winter and spring supplies planting should be done as the ground becomes vacant, in holes six inches in depth, made with an iron bar. In these holes plant the Leeks and leave the hole open for subsequent earthing as the young Leeks grow; finally each hole should be filled, after which, if needed, the plants may still be moulded up like Potatos. Plant at one foot apart, and allow 18 inches between the rows.

Celery.—Proceed with the planting of successional batches of Celery as soon as the seedlings are large enough. Plant in single or double lines, one foot apart. Provided the trenches were prepared previously, as advised, little else is needed than a dressing of burnt earth or old potting soil, if the existing soil is heavy; if the soil is dry, water the trenches before planting, and immediately after planting give regular sprayings whenever needed. Light dustings of soot when the foliage is damp with dew are very beneficial.

Turnips.—The hot weather is very trying for this crop; therefore sowings should be made in various positions. It is a good plan to make a sowing on a site that has just been freshly dug, as the seedlings often thrive under such conditions, although they may fail on ground dug some time previously. A light dressing of short lawn mowings over the seed bed will ward off attacks of the Turnip flea and give the seedlings an opportunity to form a rough or true leaf before becoming fully exposed. Give dustings of wood ash and hoe the soil frequently between the rows to encourage rapid growth.

Coleworts.—Make a small sowing of the Rosette Colewort, to follow Potatos and early Peas; sow in drills one foot apart and cover the seeds with a little fine, fresh soil.

Radishes.—To produce succulent Radishes sow seeds in partial shade, and in extra good ground at fortnightly intervals.

Herbs.—Herbs raised from seeds sown in boxes in March should now be planted in their permanent quarters. Level and lightly tread the plot, and give a surface dressing of leaf-soil previous to planting.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Peaches and Nectarines.—It is a good plan to cut out all exhausted and superfluous growths as soon as the fruits are gathered from the earliest trees. By carrying out this operation with the trees in full foliage it may readily be seen which growths should be removed to allow the proper development of those intended for the next season's crop. The remaining growths should be tied down to enable them to receive the full benefit of light and air. The trees should be thoroughly cleansed of all insect pests at the earliest opportunity, using a suitable insecticide up to its full limit of strength. Red spider may be effectually checked by carefully vaporising with sulphur; I have found Bentley's "Spidacide" an excellent remedy. The borders should be examined, and, if not thoroughly moist, afforded a good soaking of water, applying at the same time manure in some form or other. Provided the trees have received plenty of air during the time the fruits were ripening the ventilators may now be left full open both by day and night. Syringe the trees rather late in the

afternoon, as a moist atmosphere during the night is most beneficial so long as there is a current of air passing through the house.

Successional Houses.—The fruits of the earlier varieties of Peaches and Nectarines in successional houses are well advanced. Allow plenty of ventilation, and maintain a drier atmosphere during the ripening period. Nectarines, where growing close to the glass, and fully exposed to the sun, should be afforded a slight shade during the hottest part of the day. This will prevent scalding of the skin of the fruits, which, if allowed to occur, completely spoils their appearance. A light spraying of Summer Cloud on the glass affords sufficient shade without detriment to the colouring of the fruits, but it should be removed when the fruits have been gathered. Houses wherein trees are at the "stoning" period are best kept cooler until this stage is completed, after which, if necessary, the trees may be subjected to gentle forcing. Expose the fruits fully to the light or they will lack colour. Tie down the young growths as they extend, pinching out the points when they have attained the length of twelve to fourteen inches; extension shoots may be allowed to grow considerably longer. Check any growth which is at all gross in character and likely to divert the flow of sap from its neighbours. Lateral growth should be pinched back to the first joint.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet, Hertfordshire.

Agapanthus.—At this season of the year tubs and large pots filled with Agapanthuses will, if stood in a sunny position, need large supplies of water and liquid manure to keep them healthy.

Asters and Stocks.—When planting Asters and Stocks, lift each plant very carefully to prevent damage to the small roots. Plant firmly in deeply worked soil enriched with decayed manure, and if the land is somewhat heavy and tenacious add plenty of leaf-mould and grit. Place the taller varieties 12 to 15 inches apart; water the roots freely in dry weather, and when the plants have made good headway an occasional application of weak liquid manure, or a dusting of soot washed in with clear water, will greatly assist in the production of large quantities of flowers and healthy foliage. Giant Victoria and Ostrich Feather Asters are very imposing plants, either in beds or borders.

Roses.—Climbers trained on poles and pergolas should be examined, and fresh shoots springing from the base neatly secured before they become damaged. Only sufficient growths for next year's requirements need be retained; the others may be removed entirely.

Briars.—Examine Briars intended for budding (when the proper time arrives), and rub off all useless shoots; from two to four growths will be sufficient to leave on each stem.

Statice spicata, S Suworowii, and S. sinuata.—These and other Statices raised from seed sown in boxes should be planted out in rich loamy soil. Plant rather firmly and water freely in dry weather. These Statices should be more extensively grown both for summer and winter use, as when properly dried the spikes last a long while.

Propagating Spring Flowering Plants.—Do not neglect to increase the stock of Polyanthuses, Aubrietias, Alyssum saxatile, and other plants required for next spring flowering. A north border, well prepared, is the most suitable position in which to raise the stock. Supply the plants with an abundance of moisture until they are well established, keep them free from weeds, and give them every attention that they may develop sturdily.

Shrubs.—Any pruning necessary among flowering shrubs should be done as soon as the flowers are over, as the new growths will then have more room to develop and mature.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Rhododendron. — Greenhouse Rhododendrons are beautiful subjects for the flowering house or conservatory. It is not necessary to repot the plants annually provided the soil and drainage are in good condition. Give a top-dressing of fibrous peat and sharp sand, and ram the mixture very firm on the surface. If repotting is necessary, use only slightly larger pots and ram the fresh soil very hard around the old ball of roots. Place the plants in gentle warmth and syringe them frequently.

Pot Roses.—When Roses in pots are sufficiently hardened they may be plunged out of doors in ashes, fully exposed to the sun, and liberally fed during the summer with liquid manure. Later, less water will be needed. Spray the foliage with a weak solution of soapy water to prevent mildew and insects attacking the plants.

Cineraria.—Cineraria seeds should be sown now to provide the principal stock of plants for flowering next spring. Sow in well-drained pans filled with light soil made very fine on the surface. Before sowing, dip the pan in water to thoroughly soak the soil, sow the seeds thinly, cover them very lightly with fine silver sand, and cover each pan with a sheet of glass and a piece of brown paper. Place the pans in a cool house or frame and remove the coverings when the seedlings appear. Earlier raised batches of plants should be grown in suitably-sized pots in a mixture of good loam, leaf-mould and sand, and be placed in a frame or house where there is a cool, moist atmosphere.

Asparagus.—The different ornamental species of Asparagus are most useful either as decorative plants or for providing elegant foliage to associate with cut flowers. A. Sprengeri makes an excellent basket subject, and plants raised from seeds sown last autumn or early this year may be placed in wire baskets for hanging in a lofty greenhouse or conservatory. A single plant will soon fill a small basket; large baskets may require 5 or 6 plants. Line the baskets with moss and turfy loam, and then fill them with a compost of good loam with one fourth part each of leaf-mould and decayed manure, and a 6-inch potful of a plant fertiliser to each barrowful of soil. Make the compost firm around the plants. When established and growing freely in their permanent positions plants of Asparagus require an abundance of water, and should receive frequent applications of weak liquid manure. Asparagus plumosus sprays are often preferred to fern fronds in flower decorations. Young plants may be profitably planted in a narrow, well-prepared border, at the foot of a wall in a lean-to greenhouse, or close to the back wall of a fruit house. Supply the roots liberally with liquid manure and spray the plants frequently with an insecticide to keep them clean. A. plumosus and its variety nanus are useful decorative plants for cultivation in pots for associating with flowering plants. A. p. tenuissimus and A. p. scandens deflexus are beautiful varieties.

THE ORCHID HOUSES.

By G. H. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Peristeria elata.—This species, commonly known as the Dove Orchid, is the most popular member of its genus. The plants are strong growers, of terrestrial habit, and they require a substantial compost in which loam predominates to root in. Two parts of loam to one of peat fibre make a capital basis, and to this a little chopped Sphagnum or leaf-mould should be added and a considerable quantity of crushed crocks and coarse sand. Good drainage is most essential, and this should be carefully covered by a layer of rough moss or loam fibre. Pot the plants moderately firm; the base of the leading pseudo-bulbs should not be buried but just rest on the compost, which should be kept below the rim of the pot. Re-potting should be done just as growth commences in the spring, and after the operation the plants should be very carefully watered until the new roots have made some progress. When in full growth Peristerias require ample supplies of water at the roots, and especially when the pseudo-bulbs approach completion. After the pseudo-bulbs are well finished the water supply should be gradually diminished until, in winter, only enough to keep the compost just moist will be required. Peristeria elata should be grown in a light position in the Cattleya house, or similar warm structure, all through the year. Black spot or rot, which sometimes attacks the base of the pseudo-bulb, is usually caused by an excess of water, combined with a low temperature during the resting period.

Odontoglossum grande.—Plants of this old species are now beginning to make new growth, and before root action becomes brisk they may, if necessary, be repotted. Frequent disturbance is harmful, yet the roots must not be allowed to remain in sour compost, and as they are larger than those of most Odontoglossums, more root space should be given them. A couple of inches space all round the pseudo-bulbs is not too much, provided the plants are healthy and well rooted, the pots well drained, and the compost rough and open. Good A1 or Osmunda fibre two parts, and one part chopped Sphagnum-moss, with a good sprinkling of crushed crocks and charcoal, all well mixed together form a good rooting material for this Odontoglossum; it should be pressed moderately firm about the roots. Water must be supplied carefully for some time after repotting, and care must be taken during its application to the roots not to let any lodge in the young growths, or these may damp off. If the plants are afforded a light airy position in a cool intermediate house, no difficulty will be experienced in their cultivation. When in full growth they should be given liberal treatment, and water should not be withheld until the pseudo-bulbs are fully matured. O. Insleayi and O. Schleiperianum require similar treatment.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Thinning Stone Fruits.—All kinds of stone fruits should have their crops thinned to a desirable number, but it is as well to leave a few more fruits than will be required and make a final thinning later.

Established Fruit Trees.—Espalier and wall trees are now making vigorous growths, and should have their shoots regulated. All unnecessary shoots should be cut out, especially strong sappy growths, as these, if allowed to remain, rob the weaker ones. Tie in the remaining shoots to fill vacant spaces. Apricots should be examined and the shoots tied as they extend: gently draw the growths in the required direction as they are very easily broken if allowed to become too strong before being tied. It is better to start the work while the shoots are young and train them in gradually, as they can then be trained in any direction required.

Pears and Apples.—The trees of Apples and Pears should have their fruits thinned, as much finer fruits are produced if this is done, whereas if thinning is neglected the trees may carry an abundance of fruit one year and very few the next. The earlier the fruits are thinned the better, but care should be taken to see that they have set perfectly; usually, if the weather is good, the fruits set within a fortnight after the bloom has fallen. The best fruits will quickly take the lead in swelling; these should be retained and all the small ones removed. Two fruits are generally as many as should be left in any one cluster, but if the clusters are numerous, one fruit to each will be sufficient. On wall trees the fruits should be left about 4 inches apart. If extra fine specimens are desired, they should be left a foot apart, especially in the case of large varieties such as Pitmaston Duchess Pears and Peasgood's Nonsuch Apples. Fruits on weak trees should be severely thinned to allow the trees to make good growth.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 58.2°.

ACTUAL TEMPERATURE:—

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, June 4*, 10 a.m.: Bar., 30.1 temp., 59°. Weather—Dull.

Lord Ernle. Lord Ernle will carry with him in his retirement from the Presidency of the Board of Agriculture the sympathies and gratitude of all who know the heaviness of the burden which he had to bear during the years of war, and who can appreciate the level-headed patience which he displayed in dealing with an unending succession of intricate and difficult problems.

His greatest achievement during the critical phases of the war was to bring home to the public at large, in a series of forcible speeches, the urgency and seriousness of the food situation. Though short memories may be excused in these days when event surges on event with the remorseless sequence of ocean waves, none will forget that it was Mr. Prothero who warned us that we were a beleaguered city, and that we must therefore, and at all costs, see incessantly to our provisionment.

Horticulturists, in particular, will remember with lasting appreciation that it was due to Lord Ernle and to Lord Lee, Director General of Food Production, that the claims of "small cultivators" to encouragement and support were first recognised in full by the Board of Agriculture. They amply justified this recognition, and the contribution which they made to the food supplies of the nation is known to all.

The ample demonstration that intensive cultivation had a not inconsiderable part to play in the work, not only of food production in war time, but also in that of land settlement and peace time food production, led both Lord Ernle and Lord Lee to the decision that permanent provision must be made for the better organisation of intensive cultivation. A horticultural division of the Food Production Department was formed and at the conclusion of the war steps were taken to make that division a permanent part of the work of the Board. In referring to this fact, it must not be supposed that the Board of Agriculture had previously ignored horticulture. Much had already been done, for example, in establishing at Long Ashton and at Wye stations for research in fruit growing. Help had been given also to the Lee Valley Growers' experiment station at Waltham Cross, and in other directions the Board had shown its active sympathy with horticulture. Hence Lord Ernle's decision that yet further encouragement was to be given to "Potato culture" and horticulture generally, was a logical development of the Board's work; none the less, the gratitude of those interested in intensive cultivation is due to Lord Ernle for giving the outward and visible sign of the inward and spiritual grace which animates the Board. Furthermore, the industry of horticulture has received generous recognition from Lord Ernle. It was he who appointed the Horticultural Advisory Committee—now as we understand to be made permanent as the Horticultural Advisory Council—with the express object of bringing the horticultural industry into working relations with the administration, and providing the apparatus for considering and solving the many difficult problems which beset the industry. It will be remembered also, that Lord Ernle showed his solicitude for the more complete organisation of the horticultural industries by addressing the inaugural meeting of the British Chamber of Horticulture, and urging on its members the great importance of union among them.

Therefore, in wishing Lord Ernle in his retirement the peace and repose which he has so well earned, horticulturists, in common with the community at large, will desire to assure him that they appreciate profoundly his work for the State and for them.

Horticultural Imports into the United States. The Federal Horticultural Board (U.S.A.), have issued through their Chairman, Mr. C. L. Marlatt, an explanation of the provisions for entry of plants into the United States. It will be remembered that the much discussed "Quarantine No. 37" prohibits the importation of very many of those kinds of plants which have hitherto formed a large part of the horticultural export trade from Europe to the United States.

The explanation now makes it clear that limited quantities of new varieties,—that is "new horticultural and agricultural creations or discoveries," and also "necessary propagating stock"—may be omitted. Such stock must be used not for immediate or ultimate sale, but for the purpose of working up supplies. Though only limited quantities—sufficient that is, for this purpose—may be imported by any one person, there is no limit to the number of permits which may be issued. Application for the special permits required for these importations must be made through the Office of Foreign Seed and Plant Introduction of the United States Department of Agriculture. Application forms for the permits are to be supplied by the Federal Horticultural Board. The plants introduced under permit will be scrutinised by inspectors of the Federal Horticultural Board in specially equipped inspection houses, and if free from dangerous insects or disease will be forwarded to the consignee.

Unfortunately, however, the explanation, so full in other ways, does not contain a definition of what are dangerous insects or disease. This indeed is the fatally weak part of all these regulations. The Federal Board appear to us to be flying from dangers that they know not of, and we should feel more reassured if they would say what are the dangerous pests and diseases of the entry of which into the United States they bode so much evil.

In a notice issued to the Press, the United States Department of Agriculture gives statistics of the numbers of "infested" shipments received from various European countries, but again they are silent as to what these infestations were. We suggest that it is only just that they should publish this information. For example, they aver that since 1912 there have been 154 infested shipments from Great Britain, involving 62 kinds of insects. Would the United States Department of Agriculture add to our instruction by stating the names of these 62 insects? We should then be in a position to ascertain how many of them are pests in the proper sense of the word, and how many harmless, or already well established in the United States. It sounds very formidable to speak of so many hundreds of "infested" shipments, but the information in its present form is certainly valueless, and may be seriously misleading.

However, the "explanations" now issued seem to provide the means for keeping alive part, at all events, of the export trade between Europe and the United States; though why, after inspection in "specially equipped inspection houses" and certificates that the imported articles are free from dangerous insects or disease, it should be necessary to prevent the immaculate article from being sold directly, it is not possible to conceive.

Coloured Plate.—With our present issue we publish a coloured supplementary illustration representing Echium Wildpretii growing in the world-famous gardens of Tresco Abbey, Isles of Scilly, where so many rare and beautiful plants are finely cultivated. Since our illustration was prepared from Miss Gwendoline Dorrien-Smith's drawing Mr. T. A. Dorrien-Smith has passed away and has been succeeded at Tresco Abbey by his son, Mr. Arthur A. Dorrien-Smith. Echium Wildpretii, a native of the Canary Islands, is named after Mr. Wildpret, the Curator of the Botanic Gardens, Orotava, Teneriffe, who sent seeds to Kew in 1899. The resulting seedlings developed into large plants, and flowered when two years old. The long leaves, covered with silvery, silky hairs, are produced in a dense rosette, which in the case of plants grown in pots may measure 18 in. high and as much in diameter. Above this handsome rosette the flower spike extends for 2 ft. or more and carries an abundance of rich purplish-pink flowers. For the decoration of a cool house or conservatory Echium Wildpretii is a suitable and most attractive plant, and it presents a very distinct appearance both before and while flowering. Prospective cultivators of this fine biennial Echium will be glad to know that it ripens seeds in this country; consequently there is no difficulty in raising a batch of seedlings annually. The illustration of the flowering plants at Tresco Abbey shows what a fine effect Echium Wildpretii may produce in sheltered gardens which receive a maximum of sunshine, such as those in the south and west counties, and some parts of Ireland, where it should prove almost hardy, though needing protection from wet, cold weather during winter. Readers who wish to see a more critical illustration of the individual blooms and the thyrsoid inflorescence are referred to *Bot. Mag.* t. 7,847, and to the coloured plate which accompanied the issue of the *Gardeners' Chronicle* for October 26, 1912. On receipt of a proof of the present illustration Mr. Arthur A. Dorrien-Smith kindly wrote: "Echium Wildpretii is the most striking member of its genus. It is a biennial and flowers about July at Tresco. In the supplementary illustration Agave americana is seen in the middle distance, and the blue flowers on the left are those of Statice arborea,

one of the many fine species which inhabit the Canaries. On the right is a portion of a hedge of Escallonia macrantha, from Chili, showing its pink flowers." Mr. Arthur W. Hill, Assistant Director, Royal Gardens, Kew, writes: "E. Wildpretii. H. H. W. Pearson, was described and figured in *Bot. Mag.* t. 7847 (1902). It is a native of Teneriffe, where it occurs at altitudes of 7,000-8,000 ft. in the region known as the Canadas, a lofty ring-shaped plateau which encircles the cone of the Peak of Teneriffe, separating it from the rim of the ancient volcano, from the centre of which the peak springs. E. Bourgaeanum, Webb, is a synonym. E. Wildpretii has two near allies: (1) E. Auberianum, Webb et Berth., also a native of Teneriffe, and formerly occurring on the rim of the ancient volcano, but now apparently extinct. It is an extremely hispid plant. (2) E. Perezii, Sprague (*Bot. Mag.* t. 8617), a native of the island of Palma (one of the Western Canaries). This differs in the more branched inflorescence and paler flowers, as well as in certain technical characters. A systematic account of these three species is given in the *Kew Bulletin*, 1914, pp. 265—268. E. Wildpretii is a biennial, and the most suitable treatment for it is pot cultivation in a light, loamy compost in a sunny greenhouse."

Erica arborea alpina.—The ordinary form of Erica arborea has long been known in gardens, especially in those of the south and western counties. It is said by Aiton to have been introduced into this country in 1658. Although it survives the ordinary winters in our average climate, it is killed or severely injured by very hard ones like that of 1894-5 or 1906-7. Perhaps its greatest attraction is the sweet, honey-like perfume of its flowers, which open in March and April. Twenty years ago a variety of it was introduced to Kew, which has not yet shown the least evidence of tenderness. This is known as var. alpina, and it is a native of the mountains of Cuenca, in Spain, where it grows at altitudes of 4,500 feet and over. It has been freely propagated at Kew, and large breadths of it are planted in different parts of the grounds, one of which, with the plants in full flower, is shown in Fig. 142. Compared with typical arborea, the variety is of stiffer and more erect growth, the flowers, as may be seen from the illustration, transforming each shoot made the previous summer into a sturdy, cylindrical panicle of blossom. The tiny, bell-like flowers are dull white. Apart from its attractiveness when in bloom, the plant is a very handsome evergreen, for through all the spells of severe weather during the past twenty years its plume-like branches have maintained a cheerful, vivid green. Even if it never flowered it would be worth growing for the winter effect. Its young shoots are clothed with the same dense, short pubescence as the typical arborea, but it is very distinct in other respects, and in these days, when plants are given specific rank on easier terms than formerly, it deserves perhaps to be known simply as "E. alpina." It may, like other Heaths of its class, be propagated in July and August by taking off the little side twigs about an inch long and, after removing the lower leaves, dibbling them in very sandy peat and placing them under a bell glass in gentle heat.

Fig. 142.—Erica arborea alpina at Kew.

The Fairchild Lecture.—The Fairchild Lecture will be delivered at Shoreditch Parish Church by the Venerable Ernest Edward Holmes, B.D., Archdeacon of London, on Wednesday in Whitsun Week, June 11, at 11 a.m. From the beginning of the reign of Queen Anne, Fairchild carried on his business of a gardener at Hoxton, in the grounds formerly known as "Selby's Gardens," extending from the West end of Ivy Lane to the New North Road. By his will, dated 21st February, 1728-9, he bequeathed to the Trustees of the Charity Children of Hoxton and their successors and the Churchwardens of the said Parish of St. Leonard, Shoreditch, and their successors, the sum of £25 to be by them placed out at interest for the payment of 20s. annually for ever for the preaching of a sermon in the Church of St. Leonard, Shoreditch, in the afternoon of the Tuesday in every Whitsun Week in each year on the subjects following, viz.: "The Wonderful Works of God in the Creation," or on "The Certainty of the Resurrection of the Dead, proved by the certain changes of the animal and vegetable parts of the Creation."

Allotments.—In view of the number of cases which local authorities are submitting to the Board of Agriculture with regard to continuing possession of land acquired for war-time allotments, the Board has issued a statement of policy in regard to this matter. While the retention of land as allotments cannot be permitted to restrict the development of a town, or to prevent the erection of houses, factories, works, etc., the Board considers that no land cultivated as allotments should be given up for building purposes until immediately before building operations begin. Allotment authorities should, therefore, satisfy themselves that the plans of buildings have been approved by the local authority, and that the building material is available to commence the work. A Council should also notify applicants for possession that if building operations do not commence within one month of the date from which possession is given, the Council will have to consider whether they should not exercise their compulsory powers for the acquisition of the land. In cases where the owner proposes to sell the property either by private treaty or public auction, or to lease it, he often desires to resume possession for the purpose, and in some cases owners have stated that they were prepared to continue to cultivate the land pending its disposal. In such cases Councils should give a written undertaking to the owner that if the property is sold or agreed to be leased, they will be prepared to give up possession to the purchaser or person entitled to the agreement as soon as he requires immediate possession of the land for building or industrial

purposes, subject to the safeguards already outlined.

Erratum.—On page 270, column 3, in our last issue, the temperature to which water should be raised for destroying eelworms in Daffodil bulbs, was, owing to a printer's error, given as 11° F., instead of 110° F.

Presentation to Mr. Arthur Bedford.—At the conclusion of the business proceedings at the recent meeting of the United Horticultural Benefit and Provident Society, the Chairman, on behalf of the members of the Committee, presented Mr. Arthur Bedford with a case of cutlery as a wedding present and token of regard and esteem. Mr. Bedford has been Vice-Chairman of Committee for many years, and he is joining the ranks of the benedicts before succeeding Mr. Jas. Hudson in the charge of the gardens at Gunnersbury House, Acton.

Fuel for Glasshouses.—Gardeners would be well advised to consider the provision of fuel for their glasshouses during the coming winter. It is probable that coal will again be rationed, and only limited quantities be available for the heating of glasshouses. At present anthracite coal, which is considered by many to be superior to any other kind for boiler-heating, is free from control, and may be freely purchased. There is also less demand by the public for coke in the summer than in the winter, and where supplies are available a stock should be secured well in advance of cold weather.

Onion Smut.—The attention of Onion growers is directed by the Board of Agriculture to the disease known as Onion Smut. This disease is well known in America, where it causes very serious damage; but English specimens were forwarded to the Board of Agriculture for the first time last season. It is highly important that if further outbreaks occur they should be notified at once, and that the spread of the disease should be prevented. Onion Smut may be recognised by the presence of dark streaks in the leaves, which are at first covered by the skin of the leaf. The skin is soon ruptured and a black, sooty powder consisting of the spores of the fungus is exposed. These spores fall to the ground; and soil thus contaminated with spores will give rise to a diseased crop and be rendered unsuitable for Onion growing for many years. Affected plants should be dug up and burned before the spores escape.

Prunus yedoensis.—According to "Bulletin of Popular Information," New Series, Vol. V., No. 2 (Arnold Arboretum, Harvard University) this Cherry-tree has been planted in large numbers in the squares, parks and temple grounds of Tokyo. It is a fast-growing, short-lived tree rarely fifty feet high, with a short trunk not more than a foot in diameter and wide-spreading or erect branches. The flowers are white and slightly fragrant, and are followed by abundant small black fruits.

Colour in Leaves.—On the third day of the R.H.S. Chelsea Show, Dr. A. B. Rendle, of the Natural History Museum, gave an address in the lecture tent, in which he dealt specially with the decorative effect of foliage. Nothing, he said, is more refreshing to the eye than the tender green of the Fern, of which many varieties were represented in Messrs. H. B. May and Son's exhibit of Nephrodium fronds. There are very many shrubs which are grown solely for the sake of their beautiful foliage, some of which are evergreen, and some, such as the Japanese Maple, with a red or bronze tint, which provides a pleasing variety. I am often asked what is the cause of the red tint in the leaves of certain trees. The normal foliage leaf is, of course, green, the colour being due to a substance known as chlorophyll which occurs in the cells of the leaf in tiny, solid corpuscles of sponge-like structure, the interstices of which are filled with the colouring matter. These green corpuscles are also present in the red leaves, but the colour is masked by a bright red pigment (anthocyanin) which occurs, not in the form of corpuscles, but dissolved in the cell-sap. The colour of the leaf as we see it is thus the effect of the combination of the two colours. But why do the leaves of some plants contain this red colouring, and not those of others? Is the red colour a by-product in some process taking place in the leaf, or is it the result of a direct effort made by the plant for some special purpose? To these enquiries I would reply in the following terms. This red pigment is very widely distributed over the plant kingdom. If you dig up germinating acorns you will often find the fleshy cotyledons and the young stem tinged with red; and the brilliant autumn colouring of many leaves is also caused by it. Frequently in the spring also the opening bud and the young leaf are deeply tinged with red; the leaves of the Ash are a case in point. These instances all occur at periods in the life of the plant when chemical processes are especially active—the process of building up in the case of the seedling or young bud, that of breaking down in the dying autumn leaf. As to the effect of the colouring in the plant itself, it is probable that in the case of the autumn leaves, the blaze of colour which so delights the artist is of no value whatever to the trees which provide it. We can, however, suggest a use for the red colouring in the case of the young leaf. I may perhaps remind you that the green chlorophyll-corpuscle is the mechanism by which the plant is able to absorb from the sunlight the energy required to build up food from the carbonic acid gas contained in the air, and the water which is absorbed by the roots and drawn up into the leaf. Now, chlorophyll is a remarkably complex and unstable substance, liable to become decomposed under the influence of too much sunshine. The leaves of many plants which grow in countries where the sunlight is intense are so constructed as to be protected from injury by a covering of wax or some other method. The corpuscles have, moreover, a certain power of movement, and under the influence of intense light retire to the sides and back of the cells of the leaf. Young leaves, in which the outer protective skin is very thin, would be especially liable to injury by direct sunshine, and we can see in the red pigment a protective veil, which, by absorbing some of the sunlight, will defend the delicate chlorophyll from harm. Speaking of foliage plants, reference may be made to those plants which derive their decorative effect from what is known as "variegation." Caladiums and Crotons are two wonderfully variegated plants, of which you will have seen many fine specimens at this exhibition. Variegation is caused by the non-development of the green colour in parts of the leaf, which is sometimes yellow (from the presence of a pigment known as xanthophyll) or white from total absence of colour. In some cases there is a red effect, from the presence of anthocyanin in the sap. Absence of chlorophyll involves inability to carry out the proper nutritive function of the leaf, and in view of this fact it is remarkable to observe, in the case of Caladiums especially, how far this abnormality can be carried without apparently decreasing the vigour of the plant. Talking of abnormalities, there are certain cases in which the green colour, which should be confined to the leaf, invades the flower. The green Rose will occur to some of you as a garden curiosity, but a very remarkable phenomenon is a Primrose shown by Mr. Amos Perry, in which the flowers are almost as green as the leaf. Abnormalities are more common among plants in cultivation than in Nature. The "doubling" of flowers is really an abnormality, although in some cases—such as the Rose and the Chrysanthemum—it has become normal under cultivation.

Commercial Fruit Show at Cambridge.—Fruit growers in East Anglia have decided to hold an exhibition during the forthcoming autumn at Cambridge. The show will be arranged on similar lines to the one held by Kent growers at Maidstone in 1913. It is proposed to hold the exhibition in subsequent years at such centres of the fruit-growing industry as Wisbech, Norwich, Spalding, Ipswich, and Colchester. The date of the exhibition has not been definitely fixed, but October 3 and 4 were suggested as suitable days. A strong committee has been appointed, and Sir Douglas Newton, chairman of the Cambridgeshire County Council, has been invited to become the first President.

THE MARKET FRUIT GARDEN.

THE past month was one of the driest Mays of which I have any record. Here, in Sussex, only a quarter of an inch of rain fell on five days, and there was a drought of 19 days from the 13th, which continued unbroken at the close of the month. The showers which refreshed the western and northern districts unfortunately did not reach this locality, and the land is in consequence badly in need of moisture. Drought has its worst effect when it follows a very wet winter and spring, as the surface soil, having run together, is soon baked hard, so that horse cultivation and hoeing are almost impossible. Weeds have been quickly killed where hoeing could be done, but the work has been very slow and costly. Rain is now urgently wanted for Strawberries and bush fruits, as well as for Potatos and other vegetables.

FRUIT PROSPECTS.

Apples and the bulk of the Pears and Plums were in bloom in what many people would regard as ideal weather. Sunshine was brilliant day after day, and no frost 4 ft. from the ground was recorded during the month. Yet I did not consider the conditions good for the setting of fruit, experience having convinced me that a few showers greatly assist the process. The bloom made a wonderful display, for it is seldom that so many varieties blossom fully in one season. Amongst Apples and Pears there were practically no failures. It was on the strength of this brilliant premise, probably, that some of the daily papers predicted a record fruit crop. Careful inspection of the trees, now that the bloom has fallen, certainly does not support this prediction, at any rate in this district. A great deal of the bloom has failed to set. Speaking generally, there should still be a good fruit harvest, but not a record one. Apples will be plentiful, not because the trees are very heavily laden, but because so many varieties are carrying a fair crop. It is too early yet to go into details. Pears and Cherries, grown here only in the private gardens, have set moderate crops, disappointing after the profusion of bloom. Plums are more advanced, and a fair idea can be obtained of the prospects for different varieties. Victoria is the only sort carrying a very heavy crop, but Czar is not far behind, whilst Early Rivers gives a very fair promise. Pond's Seedling and Belle de Louvain have light crops, whilst President, Black Diamond and Monarch are practically failures. The non-setting of much of the Plum bloom I do not attribute to the April blizzard, except, perhaps, in the cases of Black Diamond and Monarch, which were fully open at the time, because Victoria and Czar, which were half open and more forward than many kinds, have set well. The only crop which can really be said to have suffered from the blizzard here is Gooseberries, which are a complete failure where the bushes were exposed. Black Currants promise very well on young bushes, but much of the fruit has dropped in older plantations, presumably owing to the drought. Red Currants, Raspberries and Strawberries are very promising.

CATERPILLARS NUMEROUS.

For the third year in succession there is a plague of caterpillars, chiefly of the Winter Moth group, supplemented by a good many larvae of the Lackey, common Tortrix and Figure-of-Eight Moths. All kinds of fruit trees are attacked, but the species of caterpillar vary. Growers who do not believe in spraying are likely to have a severe lesson this year. Fortunately, the fine, dry weather has favoured this work, which has gone on without interruption and without any of the chemicals being washed off by rain—a very unusual experience. I have never seen the results so successful, largely, no doubt, because a power sprayer has done the work quickly and thoroughly. Where it is possible to spray with nicotine and soft soap wash just before the bloom opens, and with lead arsenate as soon as it has fallen, no insect pest is likely to do much damage. Those of my trees that received both applications are now practically clean, but it was impossible to do all with the nicotine and soap before the

blossom got too forward. There is always a difficulty about this, because it is useless to start early, before the bloom buds have separated out in their clusters. If spraying is delayed until the petals have fallen the result is not so good, because caterpillars, together with aphides, and Apple suckers, have time to do much damage in the bloom clusters, where most of them start their attack. Nicotine and soft soap wash, used at the right time, clears aphides and suckers, and also kills young caterpillars, whilst lead arsenate applied after the fall of the bloom destroys any caterpillars that have escaped the first spraying and those that have hatched later. Suckers were very numerous amongst the Apple bloom, but freedom from aphides has been a most welcome feature of the season. There is now a mild attack of Plum aphis, and a few aphides have made a belated appearance on some varieties of Apple; but I have never before seen Apples so free from this pest.

GREASE BANDING SUCCESSFUL.

Grease-banding was tried for the first time on this farm last autumn, about eight acres being treated. I do not doubt that it has paid well. As a result, spraying with arsenate of lead has been unnecessary in many cases. Probably it might have been omitted for the whole plantation, were it not that Lackey Moth and Tortrix larvae were particularly numerous this year, and these are not controlled by banding. Some may argue, as I used to, that, if we must spray for some we may as well spray for all, and omit banding. There is, however, this great advantage about banding: it allows one breathing time in spraying. The banded trees, if they have to be sprayed at all, may be left till last without taking much harm—a point of great importance in a season when spraying is interrupted by bad weather. Unless these caterpillar plagues cease, I shall certainly band the plantations in turn, so that each will receive the treatment once every four or five years.

APPLE-BLOSSOM WEEVIL.

Widespread damage has been done this season by Apple Blossom Weevil. Never before has it been a serious pest here, and even this season the attack is practically confined to one plantation. It is most noticeable on some trees of Lord Grosvenor, where it has destroyed probably half the blossoms. On a visit to a fruit farm about ninety miles away I found a much more serious attack, all varieties being affected. I estimated the infested blooms at 90 per cent. of the whole, and, as many of the trees are Cox's Orange Pippin, which generally thrives in that place, the financal loss must be great. Growers who are not familiar with this pest are advised to examine their Apple trees at once. If any of the blossoms have failed to expand, but are capped over by the brown and dead petals, weevil may be suspected. If the bud is opened the white grub (larva) of the weevil will be found in the centre, or later on, the pupa. The weevil deposits her eggs in the half-open bloom bud, and ceases egg-laying when the blossoms expand, as the grub cannot live in the open blossom. Thus a season like the present, when the bloom is slow to develop, favours the pest by giving the female a longer period for egg-laying. Two remedies are available: (1) To shake off and burn the infested buds; (2) later, when the weevils have hatched out and are on the trees, to shake them on to tarred boards. They fall readily on slight vibration of the branches and are held prisoners on the sticky surface. *Market Grower.*

FIG. 143.—MESSRS. EDWARD WEBB AND SONS' EXHIBIT OF INDOOR FLOWERING PLANTS AT THE CHELSEA SHOW.
(See p. 260.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

The Cabbage Caterpillar.—Two simple expedients for preventing Cabbages from becoming devoured by caterpillars are worth mentioning. The first is my own discovery. Sow a row of large Carrots on a raised and flattened ridge of good compost, on either side of the row of Cabbages, Cauliflowers, etc., six inches distant from the Brassicas. The Carrots will not rob nourishment from the green vegetables, but their foliage will spread well over the Brassicas, and no butterflies will approach them. The second expedient was long practised near Paris, and was described thus, in 1844, in the *Economical Journal of France*: "Sow a belt of Hemp-seed round the borders of the ground where the Cabbages are planted, and, though the neighbourhood be infested with caterpillars, the space enclosed with the Hemp will be perfectly free."—*M. H.*

Shamrock (See pp. 160, 208).—I am much obliged to "K." for his reply in your issue of May 10, to my inquiry on this subject, and must apologise for delay in acknowledgment. It appears to me that the identity of Shamrock depends on what we want to ascertain about it; whether (1) what leaf St. Patrick is supposed to have chosen as his illustration of the Trinity, or (2) what is now recognised as the national badge of Ireland. Now with regard to (1) we shall probably never know what leaf the saint actually did select, but I imagine that he was addressing his audience in an open place, such as the slope of a bare hill, an open down, or some such clear expanse, and I have always thought that Wood-sorrel would be most unlikely to grow in such places, even in Ireland, therefore it was scarcely possible that he would have found a leaf of that plant ready to hand. It is as well to bear in mind that any leaf with three leaflets would have served St. Patrick's purpose, and it is not at all necessary that it need have been one of the Clovers or anything resembling it, such as Wood-sorrel. It is also desirable to bear in mind that the Irish word shamroge (pronounced shamrogue), of which Shamrock is a corruption, means trefoil, trifoliate, or three-leaved, and therefore gives no clue to the real identity of Shamrock; also that Shamrock was used of old as food by the Irish, and according to an article by Colgan, in *The Journal of the Royal Society of Antiquaries of Ireland* (Vol. VI., 1896, pp. 211 and 349), which very thoroughly deals with the ancient literature on the subject the species used thus were the common purple and white Clovers (Trifolium repens and T. pratense). The same author found that in response to an appeal for plants of true Shamrock from all parts of Ireland, Trifolium minus and Medicago lupulina (Black Medick) were sent in addition to the two above-mentioned, Trifolium repens and T. minus sharing the honour of being most in request in at least 25 out of the 32 Irish counties. I am inclined to think that if either of these two plants grew in Ireland in St. Patrick's time, one of them furnished the leaf he picked. *C. Nicholson, 35, The Avenue, Hale End, E.4.*

Variability in Plants (p. 251).—The occurrence of three cotyledons amongst dicotyledonous plants is frequent, even if it cannot be called common. I do not remember seeing it amongst Fuchsia seedlings, because I have not been at work amongst them; but in other members of the family, such as Clarkia and Godetia they are to be seen occasionally. It is quite common for Fuchsia macrostemma, its varieties and hybrids, to produce opposite leaves and three in a whorl on the same plant. The Sycamore (Acer Pseudoplatanus) produces two, three and four cotyle-

dons quite frequently, but one or two of the primary or original ones may undergo fission. However, it is known that three fully developed cotyledons are followed by three leaves in a whorl. In sowings of many plants I have met with a few having three cotyledons. Many dicotyledonous plants that normally produce their leaves in opposite pairs will give rise to shoots or stems bearing three leaves in a whorl, such, for instance, as Lippia citriodora, Mentha hercynica, and the above mentioned Fuchsia. Amongst tuberous-rooted Begonias I have noted greater botanical disturbances. The ovary is normally inferior, and the seed vessel closed, but I have seen double garden forms with the ovary superior, the valves of the seed vessel transformed into petals and bearing the ovules or unfertilised seeds on their upper surface. The cotyledons of some species of Anemone and Delphinium, also of Ranunculus Ficaria are united into one piece, but, of course, this is explainable, although normal. *J. F.*

—— I for many years raised considerable numbers of Fuchsias, from seeds, with the object of obtaining new varieties. In this I met with a fair measure of success, some of my raising being now recognised as standard varieties. Seedlings with three cotyledons were by no means uncommon, but the bulk of them produced leaves arranged in the ordinary, opposite manner. Occasionally some were in threes, but the plants often grew out of that irregularity. At the same time Fuchsias with leaves in whorls of threes are not so uncommon as your correspondent imagines, for I have in my garden an old-established bush of the hardy Fuchsia Riccartonii, and all the strong shoots have leaves in threes, whereas, on the minor ones, they are opposite. The scientific queries put by your correspondent are beyond me, but I have stated cases of variability that have come under my personal observation. I have met with another instance of singular behaviour in a seedling Fuchsia, or rather I should say two or three instances. One in particular grew to the height of one foot with all the leaves arranged alternately. As, however, my object was the raising of improved varieties, not curiosities, these last were destroyed when they flowered. *W. T.*

Gardeners' Hours and Wages. — *Nurseryman* (page 271) cites the case of a lady who has let her garden to a market grower, and says that she can procure her supplies at half the price she paid her gardener. For a market man to pay rent and make that garden pay him, when the employed gardener could not produce half his wages' worth, proves one of two facts. Either the gardener was incompetent, or most of his time was taken up with ornamental work. All things being equal also, what an abnormal salary that gardener must have received, considering the prices of vegetables and flowers quoted at wholesale rates in *The Gardeners' Chronicle*. Apart from this fact, is not a gardener entitled to a living wage as much as a farmer's man, even though pleasure gardening occupies most of his time? If the lady had contented herself by discharging her man nothing could have occurred to cause criticism; instead, however, she casts a slur on gardeners generally in order to gloss over either her inability or mean-spiritedness to pay a fair wage. *Henry Arnold, Highbrook Gardens, Ardingly, Sussex.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MAY 27.—*Present:* Mr. E. A. Bowles (in the chair), Dr. A. B. Rendle, Messrs. J. Fraser, F. J. Chittenden (hon. secretary), and G. Marsden Jones (visitor).

Hybrid Geums.—Mr. MARSDEN JONES showed a hybrid between Geum sibiricum and G. bulgaricum (large leaved form). The hybrid followed G. sibiricum in the main, but had the viscid hairs of bulgaricum. Hybrids between G. rivale form and G. coccineum, had leaves mainly of the rivale type and open flowers with colours varying from orange to purplish orange. Eight distinct forms, one of them more or less inclined to doubleness, were found. Geum bulgaricum had also been crossed with Geum coccinium, and had given a form with foliage near that of bulgaricum and attractive flowers. This was a particularly interesting cross, since it was between flowers belonging to two distinct sections of the genus. These were all sterile.

Narcissus Bulbocodium × N. "Emperor."—Mr. MARSDEN JONES also showed photographs of a hybrid raised between Narcissus bulbocodium conspicuus and Narcissus "Emperor." The plant had leaves seven to nine inches long, and had flowered for the first time this season five years after the cross had been made. The strontium-yellow perianth measured 2½ in. in diameter, and the lemon-chrome trumpet 1¼in. × 1⅝ in. The latter was much frilled and cut at the mouth, and the perianth segments reflexed somewhat.

Cheiranthus crosses.—Mr. MARSDEN JONES also brought flowers of a plant resulting from the crossing of Cheiranthus alpinus and C. Allionii. Those in which the seed parent was alpinus had green buds; those where the seed parent was Allionii were coloured chestnut. Some flowers showed segregation of the lemon yellow from the orange by flecks and flakes of the former colour in the petals, and in one case flowers of both shades in the same plant.

Mr. Arkwright also brought flowers of C. Allionii ♀ × alpinus with chestnut coloured buds. The flowers of this cross were somewhat smaller than in Mr. Marsden Jones's specimens. Neither was fertile, but both are easily raised from cuttings. A Certificate of Appreciation was unanimously recommended to Mr. Marsden Jones.

Prunus Padus.—Mr. FRASER brought specimens of the long-racemed form of Prunus Padus, which he said he had not found wild outside gardens in Surrey, although the short-racemed form occurred in that county.

LINNEAN.

(Anniversary meeting.)

MAY 24.—The annual general meeting of the Linnean Society was held on the 24th ult., Sir David Prain, F.R.S., President, in the chair.

The number of Fellows was stated to be 698, leaving 12 as the number of vacancies existing. The Treasurer's Report and Statement of Accounts, as audited, were received and adopted.

The General Secretary laid his Annual Report before the Fellows, showing that during the past year the deaths of 27 Fellows had occurred, or their deaths been ascertained, also 1 Foreign Member and 2 Associates; that 11 Fellows had withdrawn, and 10 had been removed from the List of Fellows by the Council, in accordance with the Bye-Laws, Chap. II. Sec. 6. During the same period 36 Fellows, 1 Foreign Member, and 2 Associates have been elected.

The Librarian's Report showed that the total additions to the library were 163 volumes and 1,509 pamphlets and separate parts; 773 volumes had been borrowed, and 505 volumes bound or rebacked. The collection of tracts is being sorted and bound.

The General Secretary having read the Bye-Laws governing the Elections, the President opened the business of the day, and the Fellows present proceeded to ballot. The ballot for the Council having been closed, the President appointed Mr. F. N. Williams, Mr. T. A. Sprague, and the Rev. Canon G. R. Bullock-Webster scrutineers; and these, having examined the Ballot-papers and cast up the votes, reported to the President, who declared the Council to be as follows:—Edmund G. Baker, Esq., Dr. William Bateson, F.R.S., Prof. Margaret Benson,* D.Sc., F. T. Browne,* M.A., R. H. Burne, Esq., Stanley Edwards, F.Z.S., Prof. J. B. Farmer, F.R.S., E. S. Goodrich, F.R.S., Dr. B. Daydon Jackson, C. C. Lacaita, Esq., Gerald W. E. Loder,* M.A., Horace W. Monckton, F.G.S., R. I. Pocock, F.R.S., Dr. A. B. Rendle, F.R.S., Dr. D. H. Scott, F.R.S., Miss A. Lorrain Smith, Arthur W. Sutton, Esq., Dr. Harold Wager,* F.R.S., Lieut.-Col. J. H. Tull Walsh, Dr. A. Smith Woodward,* F.R.S.

The ballot for Officers having been closed, the President appointed the same scrutineers; and these, having examined the ballot papers and cast up the votes, reported to the President, who declared the result as follows:—President, Dr. Arthur Smith Woodward, F.R.S.; Treasurer, Horace W. Monckton, F.G.S.; Secretaries, Dr. B. Daydon Jackson, E. S. Goodrich, F.R.S., and Dr. A. B. Rendle, F.R.S.

The Presidential Address was then delivered, on the advantage of certain modifications in the conduct of the Society under present conditions, and advocating the establishment of a fund for the payment of fees in certain cases, to be entitled "The Goodenough Fund," after the first Treasurer of the Society.

Sir David Prain having acknowledged the vote of thanks for his address, proceeded to address Prof. Isaac Bayley Balfour, F.R.S., reciting his services to the study of botany, and handing to him the Linnean Medal in gold.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

MAY 8.—Committee present: The Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, A. Burns, D. A. Cowan, J. C. Cowan, Dr. Craven Moore, J. Cypher, A. G. Ellwood, J. Evans, J. Howes, J. Lupton, D. McLeod, J. Thrower, W. Shackleton, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontoglossum eximium xanthotes var. Madonna; *O. e. x. Pearl White*; *O. Peerless var. James McNab* (eximium × Ossulstonii); *O. crispum var. Spot*; *O. promerens xanthotes*; and *O. eximium Canopus*, all from P. SMITH, Esq.

O. eximium xanthotes var. Madonna; *O. Conference* (Luciani × F. K. Sanders); *Odontioda Gladys, West Point var.*; and *Lycaste Skinneri atrosanguinea*, from S. GRATRIX, Esq.

AWARDS OF MERIT.

Odontoglossum crispum Backhousianum; *O. c. kinleysideanum*, and *O. xanthotes var. Madonna*, from S. GRATRIX, Esq.

O. Modus (Doris × Rolfeae), from JOHN WALKER, Esq.

AWARDS OF APPRECIATION—FIRST CLASS.

Odontoglossum crispum Ashiae, and *Odontioda Coronation delicata* (Vuylstekei × eximium), from P. SMITH, Esq.

CULTURAL CERTIFICATES.

To Mr. E. W. THOMPSON, for excellence of cultivation in Odontoglossums exhibited.

To Mr. A. BURNS, for Brasso-Cattleya Apollo Wrigleyi.

GROUPS.

A gold medal was awarded to P. SMITH Esq., Ashton-on-Mersey (gr. Mr. E. W. Thompson), for a group of choice Odontoglossums. A silver medal was also awarded to the gardener for excellence in cultivation. Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns), were awarded a large silver medal for a group; and S. GRATRIX, Esq., Whalley Range (gr. Mr. J. Howes), and Messrs. J. CYPHER AND SONS were awarded silver medals for groups.

The annual meeting of the society was held at 2.30 p.m., the Rev. J. Crombleholme presiding. The report and balance-sheet were adopted. R. Ashworth, Esq., was re-elected president. The vice-presidents, with the addi-

* New members.

tion of Mrs. Bruce and Miss Wrigley, officials and committee, including Messrs. A. Coningsby and E. W. Thompson in the gardeners' section, were also re-elected.

The prizes were presented as follows:—Ashworth's Trophy, J. J. Bolton's Gold Medal, Charlesworth's Objet d'Art, Cypher's Gold Medal, A. Hanmer's Silver Cup, and W. Pickup's Silvert Gilt Medal: To S. GRATRIX, Esq. Gardener's prize to Mr. J. Howes. J. J. Bolton's Silver Gilt Medal, Royal Botanic Society of Manchester's Gold Medal, and W. Pickup's Gold Medal: To Mrs. BRUCE and Miss WRIGLEY. Gardener's prize to Mr. A. Burns. A. R. Handley's Prizes and Mr. P. Smith's Prizes: To Messrs. A. BURNS, J. HOWES, and J. LUPTON.

All the above prizes are again offered for competition, with the exception of the Ashworth Trophy; this, by desire, will be given by Messrs. HASSALL AND Co., and in addition Mr. J. EVANS will offer a gold medal, with a prize to the gardener, for Dendrobiums.

It was decided that prizes shall be offered for cut flower of Orchids only, not to be in competition with plants.

Obituary.

Thomas Smith.—We announce with very deep regret the death of Mr. Thomas Smith, proprietor of Daisy Hill Nurseries, Newry, Ireland, which occurred at his home on Friday, May 23rd, in his seventy-ninth year. Mr. Smith was the son of a gardener in Birmingham, and he commenced his gardener career when a lad of about thirteen years of age in a small garden at Edgbaston. About a year or so later he was employed as under-gardener at Witley Court, Worcestershire, and subsequently entered the service of Messrs. Hugh Low and Co. at their Clapton nurseries. His next appointment was as foreman in the nursery of Messrs. James Veitch and Sons, Chelsea, where he was employed for a little over three years. He left to take up an engagement as gardener to Mr. John Smith, of Dulwich, but in a very short time he was appointed manager to Mr. Andrew G. Daly, of Newry, who was succeeded by the firm of Rodger, M'Clelland and Co. Mr. T. Smith was not slow in perceiving that there was scope for a nursery conducted on different lines to those in his adopted country, and in 1887 he commenced business on his own account. The site he took was occupied with daisy-covered fields, which led him to choose the name Daisy Hill Nurseries for his new venture. The site proved an ideal one for his purpose, and his business prospered exceedingly, necessitating an extension of the area from time to time until at the present day the nurseries occupy about sixty acres, with glasshouses and commodious packing sheds and offices. Daisy Hill Nurseries are known to plant-lovers all over the world, for Mr. Smith gathered together an almost unique collection of rare and beautiful plants, and it is stated that he cultivated no fewer than five thousand distinct species, apart from varieties. It was Mr. Smith's custom to send us from time to time specimens of the more uncommon plants in his collection, and they always proved of great interest and frequently formed material for illustrations in this journal. The catalogues which he issued from time to time were quite distinct from those of the general nurseryman's lists, as the pages were filled with descriptions of rarities and novelties which he seemed to have a genius for discovering. He was essentially a plantsman, and had the rare gift of knowing the possibilities from a garden point of view of new species or varieties that came under his notice. He received the Victoria Medal of Honour in Horticulture in 1906, the highest honour conferred by the premier horticultural society of Great Britain. Mr. Smith was a skilful landscape gardener, and his services were in great request for the designing and laying out of gardens not only in Ireland, but in places beyond the confines of the United Kingdom. Many of the streets of Newry are ornamented with various trees which Mr. Smith presented to the town of his adoption, and in other directions he was a benefactor to the town. The esteem in which he was held by his fellow-citizens is shown in the following extract which we take from the local paper recording his demise:—" By the death of Mr. Smith the town of Newry has lost one of its most enterprising and distinguished citizens, and his death is sincerely mourned throughout the community. He has, however, left behind him the priceless heritage of a good name, and his memory will always be cherished by those who had the pleasure and privilege of his acquaintance." Mr. Smith leaves two sons and six daughters. The funeral took place on May 26th in St. Patrick's Churchyard, Newry, and amongst the large number who attended were the employees of the Daisy Hill Nurseries, and the members of the vestry of St. Mary's Parish Church.

TRADE NOTES.

THE Board of Agriculture and Fisheries desire to call the attention of growers and dealers in Gooseberries to the fact that Article 4 of the American Gooseberry Mildew (Fruit) Order of 1915 has been cancelled by the American Gooseberry Mildew (Importation of Fruit) Order of 1916, which prohibits the importation of Gooseberries from any place outside Great Britain, excepting the Channel Islands. With this exception the Order of 1915 remains in force, and all

THE LATE THOMAS SMITH, V.M.H.

growers and dealers in Gooseberries should take notice of its provisions, and of the fact that they will be strictly enforced. The chief provisions of the Order are:—

(1) Every consignment of Gooseberries for sale must carry a label bearing the name and address of the consignor or a distinctive name or mark whereby the consignor can be identified.

(2) Every person who consigns Gooseberries for sale without attaching a label is liable, on conviction, to a fine not exceeding ten pounds, whether the package contains any diseased Gooseberries or not. It is not necessary to disclose the name of the consignor if a distinctive name or mark whereby the consignor can be identified is added, but salesmen and fruit sellers are bound to give the name and address of the consignor to any duly authorised inspector, who may require it in writing under a penalty, on conviction, of ten pounds, should any diseased Gooseberries be found in the consignment.

(3) Any duly authorised inspector has the power to examine any consignment of Gooseberries for sale, and to require any person, having in his possession or under his charge any diseased Gooseberries:—

(a) To refrain from moving any packages containing diseased Gooseberries from the premises where they may then be until the diseased Gooseberries are removed therefrom:

(b) To remove all Gooseberries from any package in which diseased Gooseberries may be found, and forthwith to destroy all those found diseased by fire or other effectual means;

(c) To cleanse thoroughly by washing, or other suitable method, the package in which diseased Gooseberries may be found.

(4) Berries which are not badly attacked may be sent by the grower direct to jam manufacturers if packages or containers are either destroyed or returned direct to the grower after treatment with disinfectant or boiling water.

The Board desires to remind Gooseberry growers of the fact that American Gooseberry Mildew is a notifiable disease under the 1911 Order, and that growers in whose plantations an outbreak occurs are required immediately to notify the Board of its occurrence.

AN appeal has been made by the East Sussex Nurserymen's, Fruit Growers' and Market Gardeners' Association to ladies and gentlemen in the district, asking them to abstain from the practice of sending surplus fruit, vegetables, and flowers to shops for sale. The association points out that many gardeners who send the produce to shops have no knowledge of the current market values, and consequently lower the prices in the market to the bona-fide growers. The secretary of the association states that anyone who sends produce for sale, becomes a "market gardener," and that under the Corn Production Act owners of private gardens are liable to pay a minimum rate of wages to all garden employees. The appeal suggests that the surplus from private gardens should be sent to hospitals and similar institutions instead of being sent for sale in competition with market gardeners, whose living depends on supplying the markets.

CROPS AND STOCK ON THE HOME FARM.

AGRICULTURAL WAGES.

A MEETING of the Agricultural Wages Board was held at 80, Pall Mall, London, S.W.1, on Thursday and Friday, May 29 and 30, Sir Ailwyn Fellowes presiding.

On the report from the committee which had been appointed to consider the various criticisms and suggestions made by members of District Wages Committees at the conference with District Wages Committees held on May 7, the Board decided to adopt the following rules:

(1) That no unanimous decision of a District Wages Committee shall be altered by the Wages Board until the District Committee has been furnished with the Board's reasons, and has had an opportunity of further considering the matter.

(2) That after the question of harvest rates has been dealt with every notice of proposal, before being passed by the Board for publication, shall be sent in draft to the District Wages Committee concerned for consideration and report before the next meeting of the Wages Board.

(3) That copies of the Press notice of the Board's meetings shall be sent to all members of the District Wages Committees one clear day before the notice is issued to the Press.

(4) That, in addition to dealing with actual orders made, the Press notice might properly deal with proposals and other matters not finally settled, subject to proper safeguards and the omission of specific figures.

On a report from the "Allowances" Committee the Board decided to refer the question of a revision of the allowances for board and lodging for male and female workers of all ages to all the District Wages Committees for their reconsideration with a view to the fixing of uniform rates for the country as a whole. The Board also decided to make immediate alterations in the value fixed for board and lodging for women of 17 years of age and over in all areas in which such value is at present less than 13s. for a seven-day week, and also in the value fixed for board and lodging for male workers of all ages in Pembrokeshire, Carmarthen, and

Cardigan. The actual alterations made will be published as soon as the necessary steps have been taken to give legal effect to the Board's decision.

The Board decided that in the cases of those District Wages Committees in which special rates are at present in operation for special classes of workers, such as stockmen, shepherds, and horsemen, on the basis of a weekly wage for customary hours, and which have not yet made a definite recommendation for an amendment of this basis in accordance with the principles laid down by the Board the Committees should be given a further opportunity of considering the matter, but that in the absence of a recommendation from any Committee on the lines laid down by the Board, the Board would at their next meeting take steps themselves to deal with the matter.

After considering the objection lodged to District Wages Committees, the Board decided to proceed to issue proposals to fix special rates for the corn harvest in the following areas:—Cambs., Hunts., and Beds., Cheshire, Derby, Dorset, Gloucestershire, Herefordshire, Lincs., Notts., Oxon, Salop, Somerset, Suffolk, Surrey, Wilts., Yorkshire, Anglesey and Carnarvon, and Denbigh and Flint. In the case of Devon the decision of the Board to fix special rates for corn harvest was contingent upon the receipt of a unanimous recommendation from the respective District Wages Committees. No special rates for corn harvest will be fixed in the case of the other areas in England and Wales, and the payment for harvest in such areas will accordingly be a matter for mutual arrangement between employers and workers, subject to payment of the workers at not less than the minimum and overtime rates applicable to them under the orders of the Wages Board already in force. Notice of the Board's proposal to fix special rates for corn harvest in the areas mentioned above will be published in due course, but no rates can be fixed before the expiration of a month from the date on which notice of proposal is given, during which period objections to the proposals may be lodged with the Wages Board.

The Board having consulted the various District Wages Committees decided to issue a notice of proposal to increase the minimum and overtime rates at present in operation for female workers of 18 years of age and over. No variation in the present rates can, however, be made before the expiration of a month from the date of the notice of proposal, which will be published in due course.

After considering the objection lodged to their proposal of the 15th April, to provide that in Cumberland and Westmorland and the Furness district of Lancashire the Half-holiday Order shall no longer apply in the case of any workman who, under an agreement with his employer, is entitled in each half-year either to a week's holiday on full pay or a week's work on double pay, and having also considered the report on the proposal made by the Cumberland and Westmorland District Wages Committees, the Board confirmed the proposal and made an Order accordingly, which will come into operation on the 9th June.

Considerable discussion took place with regard to the question of a variation in the minimum rates at present applicable to boys and to girls. It was eventually decided not to vary the present rates for boys or for girls, but steps will be taken to provide that, in the case of those areas where the hours on which the weekly wages for boys are based are in excess of 54 in summer and 48 in winter, or in excess of 52 all the year round, such hours shall be reduced to 54 in summer and 48 in winter without any reduction in the weekly wages.

The Board adopted a recommendation from the Notts. District Wages Committee to make further alterations in the minimum rates recently fixed for male workers of 18 years of age and over, and a draft notice of proposal to give effect to this recommendation will be submitted to the Notts. District Wages Committees for their consideration.

Recommendations from the Anglesey and Carnarvon and Merioneth and Montgomery District Wages Committees that the Board's Half-holiday Order should no longer apply in the case of any workman who, under an agreement with his employer, is entitled in each half-year either to a week's holiday on full pay or a week's work on double pay, were adopted, and steps will be taken to give legal effect to the recommendations in due course

ENQUIRY.

WILL Mr. Wm. Berry, late of Castleford Gardens, Chepstow, please send his present address to me at Castleford? *T. W. Briscoe.*

ANSWERS TO CORRESPONDENTS.

ANTS IN FRUIT AND PLANT HOUSES: *J. B.* and *S. G.* Ants are very troublesome in fruit houses, as they spread such pests as mealy bug and aphides by carrying them from one part of a tree to another. If the ant nests can be located and they are in a position where boiling water can be poured into them a clearance may be effected readily by this means. A proprietary material known as the Ballikinrain Ant Destroyer is sold by Messrs. Alex Cross and Son, Glasgow.

CATERPILLAR ON PEAR TREE: *T. T. P.* The larva had pupated. There is little doubt, however, that the trees are attacked by the larva of a Tortrix moth. It is the habit of this family for the caterpillars to roll and spin the leaves together, making it impossible to kill them by contact washes. It is unlikely that further damage will be done this season, though the larva may, of course, belong to a group having more than one generation in the year. Where this and other caterpillar attack is feared it would be well to spray the trees just before the blossom opens with lead arsenate paste at the rate of 2lb. per 40 gallons of water.

GALLS ON SPRUCE BRANCH: *M. W.* The galls are caused by the working of an aphis-like insect known as Chermes abietis. Carefully remove and burn the galls, and when insects appear on the tree spray with any strong insecticide suitable for the destructon of aphides.

GARDENERS' BENEFIT AND PROVIDENT SOCIETY: *C. B.* The best benefit and provident society devoted wholly to the interests of horticulturists is the United Horticultural Benefit and Provident Society. The secretary is Mr. A. C. Hill, 35, Alexandra Road, West Kensington Park, W., and we have asked him to send you particulars.

GRAPE VINE FAILING: *J. D.* The soil you sent seemed quite suitable for vines, and the root system was in a satisfactory condition. The rod appeared to have broken irregularly, and this might be due to the use of the material you mentioned. The top buds appeared to have made satisfactory growth, and the failure of the lower buds to grow may have been due to neglect to detach the vines from the trellis and bend them down to allow the basal buds to receive as equal an amount of sap as the upper ones.

ISLE OF WIGHT DISEASE IN BEES: *W. P.* So far as we know, no definite remedy has been discovered for the treatment of Isle of Wight disease. Several remedies have been suggested, but none of them has been carried out under strict supervision, nor has it been known if the bees actually had the disease before the so-called cure was used. It is always difficult to give a definite opinion upon any preventive; certainly no authoritative opinion has yet been given on any of them. You should be able to procure the material you refer to from your local chemist. Failing this, manufacturers of bee appliances would supply you.

LADY GARDENER: *K. J. C.* We do not think that you would find much scope as a teacher in elementary schools unless you secured an appointment as a county horticultural instructor, in which case you would probably be required to supervise some of the school gardens in the county. If you are competent to teach nature study in addition to gardening, you might be able to obtain a post; in which case, your best plan would be to advertise in a scholastic paper, such as *The Schoolmaster* or *The Schoolmistress.*

NAMES OF PLANTS: *T. L. B.* (1) Asphodelus albus; (2) Lithospermum purpureo-coeruleum. *J. O.* (1) Ercilla volubilis; (2) Lepidium Draba; (3) Rodgersia podophylla; (4) Centaurea montana. *A. N.* (1) Asphodeline lutea; (2) Thermopsis montana; (3) Trollius europaeus; (4) Epimedium pinnatum; (5) Piptanthus nepalensis; (6) Ceanothus dentatus. *W. M.* Tamarix gallica. *J. H.* Leucojum aestivum. *M. W.* Not recognised; send further specimens.

OPTION FOR LEASE: "*Swanlow Nurseries.*" Assuming that the option for renewal has been properly prepared, the purchaser must take subject to it, and the option will hold good.

PROPAGATION OF CHOISYA AND CYTISUS: *E. S.* Choisya ternata may be increased by means of cuttings of half-ripened wood inserted in gritty soil and placed in gentle warmth. Cuttings of harder wood similarly inserted and placed in a cold frame will root, but much more slowly than the half-ripened wood placed in heat. The white Spanish Broom (Cytisus albus) is readily propagated from cuttings of ripe wood inserted firmly in sandy soil during August and placed under a bell glass or hand light in a frame. The covering should be removed only when watering is necessary. Roots will form in the following spring, and at a very early period after rooting commences the plants should be potted separately, or left a little longer and then planted where they are to remain. Cytisus do not transplant well after they have attained a fair size.

SLATE-COLOURED GRUBS: *A. M.* The grubs are the larvae of the Daddy Longlegs, or Crane Fly (Tipula oleracea). The Crane Fly usually lays its eggs in grassland, and the grubs feed on the roots of the grass. This pest is seldom troublesome in cultivated ground, for when the larvae hatch into the perfect insects the females deposit their eggs in pasture land. Much of the trouble experienced by allotment-holders through ground insects damaging their Potatos and other root crops that was attributed to wire-worm was caused by Leather Jackets. The Crane Fly is seldom troublesome in cultivated land the second season, whereas the wire-worm may persist for even three or four years in the larval stage.

TOMATOS DISEASED: *Demobilised.* Your fruits are attacked by the fungus known as Macrosporium solani. Spray the plants with Bordeaux Mixture and take the precaution to destroy all diseased fruits by burning. This disease also attacks Potatos; therefore in removing the old infected soil, see that it is not placed where Potatos are cultivated.

UNHEALTHY APPLE TREE: *J. D.* The unhealthy appearance of the Apple foliage is due to an attack of mildew. Attacks are common during a period of dry weather such as we have experienced of late, especially when east winds prevail. Spray the trees with a solution of sulphide of potassium or one of the advertised specifics, used according to directions given therewith.

WIRE FOR ATTACHING LABELS TO TREES: *W. H. T.*: Copper wire is more durable than lead wire and quite suitable for the purpose. Lead wire wears through in time by the constant friction of the label.

Supplement to "The Gardeners' Chronicle"

ECHIUM WILDPRETII

In the garden of T. A. Dorrien-Smith, Esq., Tresco Abbey.

(From a drawing by Miss Gwendolen Dorrien-Smith.)

MARKETS.

COVENT GARDEN, June 4.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Plants in Pots, &c.: Average Wholesale Prices.

(All 48's, per doz. except where otherwise stated).

		— coloured ...	10 0–15 0
		Stock, Dbl. White	15 0–18 0
		Violas, per doz. bun.	3 0– 4 0

REMARKS.—Supplies of white and coloured blooms are much shorter and prices are firmer again. All Narcissi are finished for the season. Pyrethrums are now the chief flowers on sale, the double white variety being most in demand, and up to this morning there were only very limited supplies. Queen Mary is the most prominent of the coloured varieties; single sorts are better supplied. Carnations are also greatly reduced in number, and the prices for all white and scarlet blooms are likely to remain high through- this week, as there is an extra demand for flowers for Whitsun festivities. Iceland Poppies, Cornflowers, Daisies and Paeonies are daily increasing in quantity, Gypsophila elegans; the last sells freely at high prices, notwithstanding the increased supply. Roses, although fairly well supplied, are in demand, and best blooms are exceptionally scarce. Blooms of the white Frau Karl Druschki are now being offered. Sweet Peas are more plentiful and are arriving in fine condition. Choice white flowers on sale include Gardenias, Lapagerias, Stephanotis and white Gladiolus. Spanish Irises are arriving in good condition, in white, mauve, blue and yellow shades, but there is only a very limited supply.

Fruit: Average Wholesale Prices.

Leeks, per doz. bun.	6 0 —	Watercress, per doz.	0 8–0 10
Lettuce Cabbage and Cos per doz.	2 0– 7 0		
Mint, per doz. bun.	8 0–10 0		
Mushrooms per lb.	2 0– 3 0		
Mustard and Cress, per doz. punnets	1 3– 1 6		

REMARKS.—Dessert Fruits now on offer include Peaches, Nectarines, Melons, Figs, Cherries, (French), Strawberries, Grapes Muscat of Alexandria and Black Hamburgh; and Pines. Green Gooseberries are arriving in larger quantities, Rhubarb is plentiful but supplies of Tomatos and Cucumbers are limited. Mushrooms are more plentiful. Peas are a limited quantity, but Beans are more plentiful. The consignments of new Potatos are increasing daily. The market continues to be well supplied with Asparagus.

GARDENING APPOINTMENTS.

Mr. C. Lailey, for 15 years Gardener at Kenward, Yalding, near Maidstone, Kent, as Gardener to H. L. FARRER, Esq., The Salutation, Sandwich, Kent.

Mr. W. J. Abrahams, for the past 7½ years Gardener to the Hon. H. B. MONEY-COUTTS, Stoodleigh Court, Tiverton, Devon, as Gardener to C. HANBURY, Esq., Kingston Maurward, Dorchester, Dorset. (Thanks for 2s. for R. G. O. F. box.—EDS.)

Mr. G. F. White, for 1½ years temporary Gardener to Right Hon. H. J. TENNANT, Great Maytham, Rolvenden, Kent, and previously Gardener to Mrs. MACPHERSON, Wyrley Grove, Pelsall, Staffordshire, as Gardener to Col. A. S. BARHAM, Hole Park, Rolvenden, Kent.

Mr. B. Nichols, for the past 3 years Gardener to H. WHITWORTH HALL, Esq., "Krishna," Elstree, Hertfordshire, as Gardener to the same gentleman at Bennington Park, Stevenage, Hertfordshire.

SCHEDULE RECEIVED.

Durham, Northumberland and Newcastle-upon-Tyne Botanical and Horticultural Society's Summer Show, to be held Tuesday, Wednesday and Thursday, September, 2, 3 and 4, 1919, in Leazes Park, Newcastle-upon-Tyne. Secretary, Mr. R. H. Newton, 90, Pilgrim Street, Newcastle.

CATALOGUE RECEIVED.

C. ENGELMANN, Saffron Walden, Essex—Perpetual-flowering Carnations.

PRESENT - DAY GARDENING

SWEET PEAS

NEW edition by Horace J. Wright, with chapter on "Sweet Peas for Exhibition" by Thos. Stevenson. Contains 8 plates in colour. Price 3/- post free.

THE

HORTICULTURAL DIRECTORY & YEAR BOOK

FOR 1919.

The new edition of the Gardeners' Chronicle Horticultural Directory is now being distributed. Owing to the shortage of paper an unlimited number of copies cannot be guaranteed, and purchasers are advised to ORDER AT ONCE to avoid disappointment.

Orders will be dealt with in strict rotation.

The New Edition has been thoroughly revised and brought up to date. Very many changes of address have been notified during the past year, and holders of the 1918 edition are warned that that edition is now out of date.

Apply, enclosing 2/- for each copy required, to:—

GARDENERS' CHRONICLE, LTD.,

41, WELLINGTON ST., COVENT GARDEN, LONDON, W.C.2.

SITUATIONS VACANT.

Twenty words (or three lines including headline) 3s., and 6d. for every succeeding eight words (or line) or portion thereof. Fee for having replies addressed to this office, 6d.

Gardeners desiring their Advertisements repeated *must give full particulars, otherwise no notice will be taken of their communications Name and address alone are insufficient.*

Gardeners writing to Advertisers of Vacant Situations are recommended to send them **copies** *of testimonials only, retaining the originals. On no account should they enter into communication with unknown correspondents who require a fee beforehand.*

Advertisers are cautioned against having Letters addressed to Initials at Post-offices, as all Letters so addressed are opened by the Postal Authorities and returned to the Sender.

PRIVATE.

BRITISH GARDENERS' ASSOCIATION.
(Reg. No. 1666 T.)

THE B.G.A. has adopted a new standard of wages and hours, and employers and employees may obtain a copy by sending stamped foolscap envelope to the General Secretary. Before accepting fresh situations, demobilised men are advised to write the General Secretary, B.G.A., 22, Buckingham Street, Strand, W.C.2. Journeymen are required for good situations. Send full particulars of past experience.

SINGLE-HANDED GARDENER wanted at once in Watford; garden of one acre and small greenhouse; young, unmarried man preferred, who has had training and experience in a good establishment.—State wages required, write S., W. H. SMITH AND SON, 119, St. Albans Road, Watford, Herts.

GARDENER wanted (SINGLE-HANDED, help given); inside and out; small house provided; man or woman.—State wages and experience, Mrs. BROADHURST, Waterfoot, Penrith.

GARDENER WANTED, Inside and Out, glass, kitchen garden, lawns, and few poultry; cottage provided.—State age, experience, references, wages, whether married or single, and if willing to assist in slight matters, to COUSINS, Glynne Tower, Penarth.

WANTED for a Lady, good WORKING GARDENER; knowledge of Vines and Peaches under glass; wages 45s., cottage and vegetables.—HENRY PITT, Nurseryman, Abergavenny.

GARDENER AND WIFE required for Club in East Surrey; Gardener to attend tennis courts, wife for Stewardess in Club House. State combined wages required.—W., Box 6, 41, Wellington Street, Covent Garden, W.C.2.

CHAUFFEUR - GARDENER wanted; thoroughly experienced.—Write, giving full particulars of experience, age, salary required, including comfortable rooms over garage, to A. G. GRANTHAM, Thornbury, Bromley Grove, Shortlands.

GARDENER required, SECOND man of three; strong, active, and experienced; good wages and cottage.—Apply, McCREA, Warley House, near Halifax.

UNDER - GARDENER required (Surrey); room provided; board arrangeable with head gardener on premises.—State experience and wages asked, W, 650, care Deacon's, Leadenhall Street, E.C.

UNDER-GARDENER wanted, with experience of general work Inside and Out; cottage provided.—State wages (with cottage), experience and full particulrs, J. LUMB, Rose Hill, Huddersfield.

WANTED, an UNDER-GARDENER, age about 20; good wages.—Write or call, to the Gardener, J. HUTSON, The Bungalow, Chartfield Ave., Putney.

WANTED, ASSISTANT GARDENER for Outside work, and glass when necessary; good wages and cottage to suitable man.—Apply with refs., to JOHN S. DOIG, Nettleton Lodge, Caistor, Lincolnshire.

WANTED, FOREMAN (INSIDE); must be good Plantsman.—Apply, with full particulars and wages required, to C. GARRATT, Canwell Hall Gardens, Sutton Coldfield, Birmingham.

WANTED, active FOREMAN for the Glass Dept.—Please state wages, bothy, etc., A. GIBSON, The Gardens, Headington Hill Hall, Oxford.

WANTED, FOREMAN for Plant and Fruit Houses; wages 35s. per week, bothy, milk, and vegetables.—Apply, full particulars, W. KINGSWOOD, The Gardens, Norman Court, Salisbury.

WANTED, FOREMAN for Pleasure Grounds and Decorating; wages 35s., bothy and vegetables; 1 o'clock Saturdays.—G. BRADLEY, The Gardens, Hamstead Marshall, Newbury, Berks.

WANTED, First JOURNEYMEN (INSIDE); must be experienced; also man for outside; good wages and bothy.—C. B. ELLIOTT, Blyth Hall Gardens, Rotherham

WANTED, JOURNEYMAN for Pleasure Grounds; 34s. per week, bothy, etc.; 50 hr. week; duty and overtime paid.—Full particulars to H. CHANDLER, Coombe Abbey Gardens, Coventry.

WANTED, experienced JOURNEYMAN for Fruit and Plant Houses; wages 33s. to start; also good strong lad as IMPROVER; wages according to experience; also man for Herbaceous borders and general Pleasure Ground work; good bothy and attendance; 10s. extra for duty; 1 o'clock Saturdays.—State ages and full particulars, with copy testimonials, to HEAD GARDENER, King's-Walden-Bury, Hitchin.

WANTED, six smart, active JOURNEYMEN immediately, chiefly for Pleasure Grounds; lodgings now, bothy later; state experience, age, wages expected.—Copies of testimonials, etc., to GEO. MORBEY, The Gardens, Lilleshall House, Newport, Salop.

WANTED, two more JOURNEYMEN (Outside chiefly); with bothy, 32s. per week, duty and overtime extra.—Apply D. MOYES, The Gardens, Osterley Park, Isleworth, Middlesex.

WANTED, JOURNEYMAN for Inside and out; good wages.—Apply J. V. MACDONALD, The Gardens, Whetstone, Edgbaston, Birmingham.

WANTED, experienced JOURNEYMAN for Fruit and Plant House; also one for inside and out; both take duty alternate weeks; wages 35s. and 30s. respectively, with bothy and vegetables; 1 o'clock Saturdays.—Apply with reference to J. BOTTRELL, Sudbury Hall, Derby.

WANTED, JOURNEYMAN and IMPROVER for inside and out; bothy, milk and vegetables, etc.—Apply with full particulars as to experience and wages required, to T. DOWN, Basing Park Gardens, Alton, Hants.

WANTED, experienced JOURNEYMAN for Fruit and Plant Houses; also an IMPROVER, about 20, able to take duty; 36s. and 25s. per week respectively, with bothy.—Apply, with references, to H. PICKSTOCK, The Gardens, Maer Hall, Newcastle, Staffs.

WANTED, JOURNEYMAN for Fruit and Plant Houses; also one for kitchen garden, and one capable of working motor mower and assist with herbaceous borders; wages 35s., 10s. extra paid for duty, 11d. per hour overtime.—State age, particulars of experience, with copies of references, to J. BROWN, Burford, Dorking.

THE MANGO.

By G. MARSHALL WOODROW.

A fascinating account of the culture of this fruit, so popular in our Indian dependencies. Excellently illustrated, with coloured frontispiece.

Price 1/-, post free 1/2.

GARDENERS' CHRONICLE Ltd., 41, Wellington Street, London, W.C.2.

HOW MANY PEOPLE

in this country who eat dried Dates ever think of these fruits growing on trees, succulent and fresh?

Probably not one in a hundred. Yet the subject of Date-growing is one which has interest for all, and especial interest for those who are intending to take up fruit-growing in a tropical or sub-tropical colony. They should at once procure and read the excellent work by Mr. Paul Popenoe,

DATE GROWING IN THE OLD WORLD AND THE NEW

in which they will find every sort of information necessary to the Date cultivator. The price is 9/6 post free, and it can be obtained from

GARDENERS' CHRONICLE, LTD., 41, Wellington St., London, W.C.2.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

Gardeners' Chronicle Horticultural Directory.

There are still a few copies of the *Horticultural Directory* on sale, but the 1919 edition is now nearly exhausted, and those who wish for a copy should write at once.

Gardeners who have surplus fruit for which they desire to find a market should consult the list of SALESMEN in all the largest towns of the United Kingdom, which is to be found on page 275 *et seq.*

Demobilised men who desire information of the whereabouts of their gardener friends will find the list of gardeners' names and addresses invaluable.

Apply, enclosing 2/- for each copy required, to:—

FERNS AND FERN CULTURE

By J. BIRKENHEAD. Revised by F. PARSONS.

THIS little work contains all that the Fern-lover needs to know about the raising and cultivation of Ferns. It tells him where the different classes of Ferns are to be found growing wild; the modes of growth of the different species; the sort of treatment each kind of Fern requires; how to tend the plants in sickness and in health; how to eradicate the pests, both insect and fungous, which threaten their well-being. It is freely illustrated, and all the illustrations serve a definite purpose. The book is excellently printed, on clear, good quality paper; it is well bound in pale green cloth, and this is protected by a second cover of transparent, grease-proof paper. Although so reasonable in price, it is worth almost any money, for it is quite unique.

Send 1/3 for a copy, post free, from

GARDENERS' CHRONICLE, Ltd., 41, Wellington St., Strand, W.C.2.

CELERY AND WHITE WORMS.

THE problems which the gardener has to face to-day, so far from becoming simpler with the advancement of science, seem ever to grow more complex and manifold. And among all these problems, few give more occasion for anxious thought than the ever-increasing lists of parasites and pests. The choicest plants are ever liable to attack, and it seems impossible, even by the aid of all the new methods which modern research has put within our reach, to compass the limitation or destruction of the pests.

During the past thirty years I have made a special study of the different kinds of worms which abound in gardens, lawns, pastures, woodlands and manure heaps, and recently I have been investigating as to whether the small white worms, known as Enchytraeids, are friends or foes. As I was taking up the last of my Celery plants during the past spring, I observed about the roots a number of white worms which were, to all appearance, engaged in eating away the rootlets which they so closely resemble. Thus I was led once again to ask myself the question—are these tiny creatures really responsible for the mischief which is so often wrought by some pest in the Celery crop?

In 1837 Henle first employed the Greek term Enchytraeus, meaning something found in pots, to designate the white worms with which most gardeners are familiar. He had observed them at the roots of plants in flower pots, and on that account introduced this very appropriate name. Twelve years later (1849) Hardy described the commonest species as the Putrid Worm (Lumbricus putredinis) because it abounded among evil smelling, decaying Turnips. In 1865 it was stated that the same worm, which had already received a variety of names, was common in this country, and was usually to be found "in the soil under the bark of rotted trees, in decaying leaves, and at the roots of decayed vegetables." It was forty years after Henle had described Enchytraeus, however, before attention was drawn to the fact that other members of the family were found in connection with diseased plants, and were suspected of causing the trouble. Vejdovsky, who some years before had made observations on the subject, wrote a pamphlet in 1891 with the title (in German), "Can Enchytraeids cause diseases in roots?" He dealt especially with the Sugar Beet, and enumerated several species of worms which were under suspicion, but did not carry out any experiments.

The first reference to injury due to Celery, presumably by their agency, came from myself. In January, 1902, I received from Professor Carpenter, of Dublin, a consignment of worms with the following note: "They are burrowing in Celery stems, and the person who has sent them believes them to be the primary destructive agent. I think they may have got into the stem through old fly-maggot humus, but they are enjoying themselves there now." Reporting on the subject in *The Irish Naturalist* (May, 1902, page 110), I wrote: "A pocket lens at once revealed the presence of a destructive and well-known white worm (Enchytraeus parvulus, Friend), which has been known in England since July, 1897, when I discovered it in the vicinity of Birmingham, doing immense harm among Asters. I therefore named it the Aster Worm, and soon received specimens of sick Asters, suffering from the same pest, from many parts of the country. I have now to point out a curious fact. In the winter of 1897-8, after I had described the Aster Worm and recorded it for many different parts of the country, besides obtaining it under circumstances which clearly showed it was an indigenous British species, I found it had attacked my Celery. During the early stages of the Celery sickness only Enchytraeus parvulus was noted. As the sickness progressed, however, a new form made its appearance. Presently the two forms were equal in number, but eventually, in March, 1898, the second form entirely predominated, and Enchytraeus parvulus was nowhere to be found. The strange fact is that these same two worms appeared in equal numbers in the material sent me from Ireland. This is a most remarkable coincidence. Doubtless, here again, Enchytraeus parvulus led the way. In January two forms were at work in equal numbers, and one may expect that by March parvulus will have disappeared, and the larger form be in supreme possession."

Again in 1903 and 1904 Celery with disease and Enchytraeids at the roots reached me from Professor Carpenter, but I unfortunately failed to keep copies of my reports. I find, however, that not only E. parvulus, Friend, but E. albidus, Henle; Julus, the larvae of the Celery fly, a species of Fridericia, and other entomological specimens were recorded as being present.

In 1906 my correspondents included Mr. Chittenden and Mr. Kenneth D. Scott, of Messrs. Scott Bros., Hurst, Twyford. The latter reported on February 8: "Recently I found the worms simply surrounding the bases of Celery plants, and well in amongst the tissues of outer leaf stalks." I believe they were chiefly Enchytraeus albidus, but here again I am guided by memory and brief memoranda, as my letters were not copied.

On February 8, 1910, Mr. Hayton wrote from Kirkby Stephen asking: "Can you give me any particulars regarding the long, white worms in the enclosed manure? They are very troublesome in my garden, and I think they ruin my Celery, destroying the roots. Every year they are always in abundance." In this case the worms were again E. albidus, a species which abounds in manure heaps, and, as a consequence, is almost invariably introduced in large numbers into the Celery trench.

Since 1910 I have had no definite inquiries of this kind relating to Celery, and the matter had almost passed from my memory till the past spring, when more than one species of Enchytraeus and Fridericia made their appearance in my trenches. What is the judgment? Were the worms the cause of Celery disease or not? If they were, which species is guilty, or can any white worm be the aggressor? If the white worms were not primary agents in the matter, what part did they play, and what originally started the disease? It was such questions as these which led me in 1914 to commence a series of experiments under the Board of Agriculture, and I hope to be able at an early date to give the definite results obtained from my researches.

In the meantime, may I ask gardeners and others to send me specimens of worms of all kinds which they find either in connection with diseased flowers and plants, or under any circumstances which invest them with interest? Specimens should be sent in tin boxes, not perforated, addressed: Department of Zoology, University, Edmund Street, Birmingham. *Hilderic Friend.*

CULTURAL MEMORANDA.

SUMMER CULTIVATION OF FRUIT TREES.

THE roots of fruit trees should receive a soaking with liquid manure as soon as the fruits start swelling, and afterwards be heavily mulched with farmyard manure to prevent evaporation of soil moisture. The surface dressing of manure will also promote the growth of fibrous roots near the surface. Fruit trees that have been planted for several years require a stimulant to enable them to bring the crop to perfection, and this is especially necessary in the case of trees planted in light, gravelly soils. The best time to apply concentrated food is during the next two months. Stone fruits, including Peaches, Nectarines, Apricots, Cherries and Plums, need calcareous matter in the soil, for if lime be absent from the soil the fruits are liable to drop at the stoning stage. Summer pruning of all fruit trees should be carried out systematically. It consists of periodically pinching or stopping all side and spur growths to four leaves in the case of Apples and Pears, and five for Cherries and Plums. If the trees are fully grown, and it is not desirable they should attain a greater height, the leaders should be similarly shortened. This shortening of the shoots will allow sunlight and air to reach all parts of the trees and exert their influence on the ripening of the wood. Young, newly-planted trees should be treated according to their individual requirements; no hard and fast rule can be laid down. The usual practice is to retain the leading shoots two-thirds their length, merely pinching out the tips and making provision for furnishing the trees, where required, with a further series of branches by leaving the necessary number of young shoots in suitable positions: these again should be merely tipped. All other growths may then be stopped at the fourth or fifth leaf to form fruit spurs. If this system of stopping is continued, very little winter pruning will be required, and the trees will crop freely and regularly. Morello and Sweet Cherries require somewhat different treatment. In their cases the young growths are best shortened about half their length, and any congestion of wood arising from this mode of treatment should be attended to either after the crop has been cleared or in winter. Guard against over-cropping, especially in the case of young trees, and take measures to eradicate insect pests directly any are detected. *Victor Gregson, Penrose Park Gardens, Helston, Cornwall.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM HARVENGTENSE PITT'S VARIETY.

AT the meeting of the Royal Horticultural Society's Orchid Committee, on May 27, H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a First-Class Certificate for this beautiful Orchid (see Fig. 144). The flowers are pale canary yellow, with white bases to the sepals and petals, the latter and the lip bearing distinct dark red blotches. Mr. PITT obtained a similar award for the earliest form of this hybrid between O. crispum and O. triumphans, under the name of O. harvengtense, Rosslyn variety, on May 24, 1896. proof of his long connection with Orchid culture, and especially with Odontoglossums, which have always been a leading feature in his collection. O. harvengtense was originally imported with Odontoglossum crispum, and doubt as to its origin existed until it was found to be a natural hybrid between O. crispum and O. triumphans, the latter species having been found growing with O. crispum. One of the earliest plants to flower bloomed in the establishment of M. Chas. Vuylsteke, at Loochristy, Ghent, and was named O. loochristyense, a name which was commonly used in British collections until the name now given was established by right of priority.

ORCHIDS FROM ST. ALBANS.

Messrs. SANDERS, St. Albans, send, for recording, flowers of the following fine novelties :—

ODONTOGLOSSUM SIREN (nebulosum × Fascinator). A very distinct hybrid, adhering closely to O. nebulosum in form, but with broader segments. The flowers are pure white with clusters of purplish red spots on the inner halves of the segments, and around the fleshy, yellow crest.

ODONTOGLOSSUM ROSSINATOR (Rossii majus × Fascinator). The ground colour of this hybrid is blush white; the sepals are spotted with claret-red, the petals having similar markings at the base. The lip is entirely blush white, with a yellow crest.

ONCIDIODA SANDERAE (Odontioda Sanderae × Oncidium macranthum). A worthy companion to the brilliant O. Cooksoniae, but with longer and more acuminate segments. The colour is deep scarlet with a light, golden shade.

ODONTIODA FRED SANDER (Miltonia Warscewiczii × Odontoglossum illustrissimum). The sepals and petals are chocolate-purple, with white tips. The white lip has a chocolate-purple base and yellow crest.

ODONTONIA FANTAISIE (Miltonia Warscewiczii × Odontoglossum crispo-Harryanum). The lanceolate sepals and petals are tinged with purple. The lip also is purple, but with a white front.

ODONTIODA MAGALI SANDER (Oda. Charlesworthii × Odm. Magali Sander). A large, finely-formed flower of a rich vinous-purple colour, with slight whitish markings, the lip being freckled with rose colour.

LAELIO-CATTLEYA RALPH SANDER. A pretty flower obtained by crossing Cattleya Mossiae Reineckiana Forget's variety and Laelio-Cattleya Phryne (C. Warscewiczii × L. xanthina). The flower, which is larger than the C. Mossiae parent, has white sepals and petals, with a very faint yellow shade derived from L. xanthina, the broad lip being bright purple, shading into rose-purple towards the margin.

FIG. 144.—ODONTOGLOSSUM HARVENGTENSE PITT'S VARIETY (R.H.S. FIRST-CLASS CERTIFICATE, MAY 27, 1919).

TREES AND SHRUBS.

EUCOMMIA ULMOIDES.

IT may be of interest to record the fact that a specimen growing here of the above Chinese tree —rare in cultivation in this country—produced flowers (male ones) this spring for the first time. It was planted in May, 1910, in a sunny position in dry ground, and has a girth of eleven inches and a height of seventeen feet. It would, no doubt, have been bigger all round if it had not had to submit to some pruning to keep it within bounds, as unfortunately it has been put in a part of the garden unsuitable for a permanent tree; consequently it may have to be sacrificed shortly. This tree is not likely to meet with favour in gardens, as its flowers are very inconspicuous and its foliage possesses no particular attraction. It is of interest, however, botanically, both on account of belonging to a monotypic genus of somewhat doubtful affinity and also by reason of the presence of "elastic" threads in its leaves and bark. *J. Parkin, Blaithwaite, Wigton, Cumberland.*

AN ALLOTMENT GARDEN IN INDIA.

THE following notes on an allotment started for our depôt in India may prove interesting. The allotment was started by me when our depôt moved to Belgaum—the regiment still being on service in Mesopotamia—as an experiment; and has proved so successful that it is likely to be repeated on a larger scale next year.

Belgaum is in the Deccan, on the eastern slope of the Ghats, 300 miles south of Bombay. The altitude is little under 3,000 feet, and it is sufficiently near the sea—70 miles—to enjoy sea breezes right through the hot weather. The rainfall is variable, averaging perhaps 40 inches; but it may be so little as 10 inches or so much as 100 inches. However, as our garden records only cover a period from January to March, we need not anticipate what will happen when the rains come. Throughout this period the average daily shade maximum was about 90°F., while at night the temperature often dropped to 60°F. The soil is derived from laterite and volcanic trap, which appears everywhere on the stony hillsides.

The garden was cut out of a slope, on the terrace system to facilitate irrigation, and immediately below the sepoys' bath-house, whence we obtained our water; indeed, it was with a view to using this surplus water—in a district where water is none too plentiful—that the garden was started. We began early in January, and by the end of the month had made nine terraces 90 ft. by 30 ft., the banks being from six to nine inches high. The ground was so hard it had to be broken up with picks, and the solid clods smashed up; the grass was then removed and an immense number of loose stones and boulders were finally taken out. The result was soil, of sorts, which was enriched with ashes from the incinerator. This was the only way we had of getting rid of the ashes, so that the garden served its turn in more ways than one.

Our seeds were obtained from the municipal gardens, Poona, the largest military station in southern India, and comprised dwarf Marrowfat Peas, French Runner Beans, White Globe Onion (acclimatised), Spinach, Walcheren Cauliflower, Lettuce, Cabbage (Neapolitan), Radish (long scarlet and Turnip scarlet), Carrot (Altrincham Scarlet), and Tomato. Enough were obtained to fill the garden, and they cost us sixteen rupees.

The earth was hoed up in rows, with channels between, down which the water from the bath-house ran, and was allowed to flow from terrace to terrace. None was wasted, it was too precious; for we were not permitted to use any but overflow water.

Sowing began on January 24, when Peas, Beans, Cabbage, Cauliflower, Onion and Spinach were put in; on the 25th, Carrot, Lettuce and Radish, and on the 26th, Tomato.

The first to appear above ground were the Radishes, on January 29, followed by Peas, which appeared next day, together with a few Lettuces and Onions. By January 31 the Peas and Radishes were growing well, and Cabbages and Cauliflowers were showing above ground; these were followed by Beans on February 1. By February 3 the Beans were doing well, and a few Carrots and Tomatos were showing; but it was really a case of Peas and Radishes first, the rest nowhere.

Trouble now appeared amongst the Onions, which had germinated well. They seemed to be "damping off," so I reduced the water supply. Before the end of the month they had completely recovered, and though growing very slowly, showed no further symptoms of distress.

By this time the Radishes were almost fit for eating, and both the Pea and Bean terraces looked fine. Cabbages and Cauliflowers were doing well, too, in a steady, unostentatious way; the seeds of these last had been sown too thickly, but they stood transplanting well and rapidly recovered. The Tomatos, too, were doing all that was expected of them.

Not so the Carrots and Lettuces. Only a small portion of these germinated, and they

grew very slowly; the same is true of the Spinach.

The next trouble appeared amongst the Peas and Beans, the lower leaves in each case turning sickly and dying. However, this did not appear to affect the plants adversely, and I came to the conclusion that it must be due to ashes having been showered carelessly on them, or piled up around them.

It was extraordinary the number of birds which visited this somewhat unattractive little garden plot. Numbers of crows, wagtails and larks came to the terraces daily, some to bathe in the irrigation channels, others to poke about amongst the beds. The crows were a serious menace, and we had to place a sentry over the garden, whose duty it was, besides driving away inquisitive dogs and goats, to throw stones at birds.

By February 24 several Runner Beans were in flower. On the same day green caterpillars were found on the Peas, and severely handled by a working party of Sepoys. On March 1 we pulled the first Radishes and sent them to our hospital; some of them were of enormous size. On March 7 we almost cleared out one bed of Radishes, getting just over 30 lbs., which were divided amongst the companies. This was the long Scarlet Radish, of which we had sown 2 oz. of seed. We had already had some from this bed, and there were numbers of plants still left after pulling up the 30 lbs. This was exactly six weeks after sowing.

On March 4 the Peas were in flower and looked like doing well till a hungry cow came one dark night and ravaged both Peas and Beans. However, those which were left after her visit did well.

On March 10 a start was made on the Turnip Radishes, 30 lbs. being taken from the bed, which, a week later, hardly looked as though it had been touched. By the middle of the month the first Tomato was in flower; the plants had done splendidly, all the seeds germinating.

The Onions, too, had made progress, and were almost ready for pulling, while the Cabbages and Cauliflowers looked fine, in spite of increasing difficulties with water, and a shade temperature of nearly 100°F. every day. There was not an atom of shade in the garden.

What happened after that I do not know as I was demobilised and left Belgaum on March 19; but by that time a good start had been made, and the Sepoys knew how to run the garden by themselves. *F. Kingdon-Ward.*

FERTILISERS FOR POTATOS.*

It has repeatedly been shown that a small dressing of dung—10 tons to the acre—supplemented by artificials, usually gives larger crops Potatos and of better quality than larger dressings of dung.

A suitable dressing is 10 to 15 tons of dung at the time of planting in the North, but in winter, if possible, in the South and West, and supplemented by the following:—1 cwt. sulphate of ammonia, 4 cwt. superphosphate, 1 cwt. sulphate or muriate of potash; or 1½ cwt. sulphate of ammonia, 4 cwt. superphosphate, 1½ cwt. sulphate of muriate of potash.

Where no dung has been used the dressing of artificials must be increased. In these circumstances the Lancashire recommendation is 2½ cwt. sulphate of ammonia, 6 cwt. superphosphate, and 2 cwt. muriate of potash. In many districts, however, this dressing of superphosphate would be excessive; probably in the Eastern Counties considerably less might be used. In North Wales, however, phosphates are very effective and can be liberally applied: possibly the nature of the soil and the high rainfall are important factors.

There is no point in giving too much nitrogen or too much phosphate; excess of nitrogen only produces excess of haulm and may reduce quality, while excess of phosphate may hasten ripening and bring the growing season to an end. These points are illustrated in the following experiments taken from the Devon Report:

YIELD OF POTATOS PER ACRE.

	T.	cwt.
Increasing Phosphate.		
400 lb. super + sulphate of ammonia and sulphate of potash	8	8
533 lb. super + sulphate of ammonia and sulphate of potash	7	13¼
Increasing Nitrogen.		
256 lb. sulphate of ammonia + sulphate of potash	8	8
341 lb. sulphate of ammonia + superphosphate and sulphate of potash	7	11¾
Increasing Potash.		
192 lb. sulphate of potash + superphosphate and sulphate of ammonia	8	8
256 lb. sulphate of potash + superphosphate and sulphate of ammonia	8	18½

In the Glasgow experiments a mixture of basic slag and superphosphate (3 cwt. of each) was better than superphosphate alone; at Holmes Chapel steamed bone flour (3 cwt.) was better than either. In the Northumberland and Durham districts 2 cwt. of high grade basic slag is recommended in partial replacement of the superphosphate, and the following dressing is suggested: 10 to 12 tons dung, 1 cwt. sulphate of ammonia, 2 cwt. basic slag, 1½ cwt. superphosphate.

In the North, Potatos are usually planted in drills about 30 inches apart. The drills are first opened with a double mould-board plough, and the dung is spread evenly in the bottom of these drills. On the top of the dung the artificial manures are applied, then the Potatos are planted, and the drills covered. It is advantageous to apply the basic slag by itself, as when this fertiliser is mixed with sulphate of ammonia and superphosphate there is likely to be a loss of ammonia, and, further, the mixture does not distribute well.

Where dung was applied the omission of potash did not prove serious in cool, moist districts, e.g., Lancashire, Wales and Somerset, or in land in good condition in Herts. In these circumstances, therefore, the grower need not be over anxious if he cannot get potash, so long as he has dung; he can use 1 to 2 cwt. of sulphate of ammonia and 4 cwt. of superphosphate, or 2 cwt. of bone meal, in addition to the dung.

Where no dung was applied, and in the more forward districts on lighter soils, however, e.g., Herefordshire, Devon, Bedford, Wiltshire, potash has proved more necessary, and greater efforts must be made to secure it.

On peaty soils the dressings of sulphate of ammonia may be reduced, and in the Fens it can be dispensed with altogether.

On clay Fen land the following has worked well: No dung, up to 6 cwt. superphosphate; on silty Fen lands—no dung, 4 to 6 cwt. superphosphate, ½ cwt. sulphate of potash.

On the whole, sulphate of ammonia and superphosphate have proved better than nitrate of soda and basic slag, both of which rather tend to set up alkaline conditions favourable to scab. Lime is to be avoided for the same reason.

* *Notes on Manures for May.* From the Rothamsted Experimental Station, Harpenden, Herts. Reprinted from the *Journal of the Board of Agriculture*, Vol. XXVI., No. 1, April, 1919.

FIG. 145.—CARNATION CLEOPATRA; A BORDER VARIETY OF RICH OLD ROSE COLOUR.

CARNATION CLEOPATRA.

The fine border Carnation Cleopatra illustrated in Fig. 145, attracted a great deal of attention at the Chelsea Show by reason of its fine size and excellent form. It was raised and exhibited by Mr. James Douglas. The colour of this broad petalled variety is rich and deep old rose—a shade that is very popular at the present time and not hitherto well represented among finely formed varieties of border Carnations. This variety, like The Grey Douglas and the deep scarlet Surrey Clove, carries its big blooms on long, wiry stems, consequently it is particularly useful for floral decorations where its charming colour is suitable. Cleopatra is a border Carnation of the best type, and it was granted an Award of Merit by the Royal Horticultural Society's Floral Committee on May 20.

THE ROSARY.

ROSE VICTORY.

THE beautiful, rich crimson H. T. Rose named Victory, illustrated in Fig. 146, was shown by Messrs. McGredy and Sons, Portadown, Co. Armagh, at the spring show of the National Rose Society, held on April 29 last. The variety was the only seedling on that occasion to receive the award of a Gold Medal, and those who saw the beautiful blooms exhibited by the raisers generally agreed that the novelty was worthy of the high award conferred on it by the Floral Committee of the National Rose Society. As will be seen on reference to the illustration, the flower has great beauty of form, both in the expanded stage and in the developing buds. The colour is rich, velvety crimson which tones with age, and shows a rose tinting. The raisers state that the plant possesses a good habit, that the foliage is a shining, rich green, and rarely affected with mildew. Victory promises to become of great value as a garden Rose, and may perhaps be best described as an improved Richmond. Red Roses—a popular term that embraces those of crimson shades—are favourites with the general public, and in consequence valuable to the grower for market. Richmond has proved a splendid market Rose, and if the newcomer possesses the merits claimed for it, market growers and florists will doubtless include it amongst popular sorts grown for the cut flower trade.

FIG. 146.—ROSE VICTORY: A RICH CRIMSON H.T. VARIETY.

THE ALPINE GARDEN.

POTENTILLA NITIDA.

AT one time, when good alpines were scarcer than now, the dainty Potentilla nitida was frequently cultivated. Now, although seen in many good collections, it does not come under one's ken in every rock garden. This is due to no lack of charm, but probably to an almost inveterate shyness of flowering unless it receives special consideration, which many do not give. It is almost impossible to over-praise a good plant of this Potentilla, two or three feet across, thickly starred with little flowers rising from a cushion of charming, silvery foliage. To ensure success, not so much in the growth of the plant, but in flowering it, special requirements are needed. It is not difficult to grow and will form good masses in almost any soil, provided the ground is not excessively stiff or wet. But to persuade it to flower is another matter, and there appears to be one or two desiderata called for by P. nitida. One is a dry, poor soil, such as the medium afforded by a dry moraine. Another is a supply of lime, which can be easily supplied by working among the foliage of an established plant old mortar, broken small, or small limestone chips, and then watering it well in. Pieces of limestone should also be set around the plant. Such treatment will generally induce the plant to flower freely. There are two forms, one with rose and another with white flowers. *S. A.*

The Week's Work.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

The Early Vinery.—Where the fruits of Black Hamburgh and other early Grapes have become fully ripe cooler treatment should be afforded, fire-heat being employed only to maintain a temperature of 60 degrees; at the same time the house should be freely ventilated. If Madresfield Court, Duke of Buccleuch and other varieties liable to crack their fruits are forced early, condensation of moisture on the fruit must be carefully prevented, as this is one of the causes of cracking. A sudden rise of temperature and a moist atmosphere will cause a good deal of mischief in a very short space of time. To prevent this danger a small amount of ventilation should be provided at the top of the vinery at all times, and a gentle warmth constantly maintained through the hot-water pipes. Afford ventilation early in the day so as to prevent the heating of the fruit. To obviate the need of applying water while ripe Grapes are hanging on the vine provide a mulch of strawy manure, previously sweetened out of doors. Allow the laterals to grow with a little more freedom, but avoid overcrowding of the foliage. To conserve the colour of Black Grapes some light shading should be placed over the house. When the weather is bright path and wall surfaces in the vinery should be damped occasionally, but always when the ventilators are open.

Late Vines.—The final thinning and tying up of the shoulders of bunches of Grapes should be finished or nearly so. Grapes intended for late keeping should have all the inner berries removed, as these berries are the most likely to decay in the autumn, and it is then difficult to remove them without spoiling the appearance of the bunch. Sub lateral growth should be stopped at frequent intervals to prevent overcrowding of the foliage. Increase the ventilation early on bright mornings and close the house early to take advantage of sun heat. A little air should be admitted late in the evening and during the night. Lady Downe's is a Grape very apt to scald, and where the vines are exposed to the early morning sun it is most essential that sufficient ventilation should be left during the night to ensure a free current of air throughout the house when the first rays of the sun reach the roof. Outside borders should be mulched with light, strawy litter. Mulchings of a heavy character do more harm than good, particularly during a wet season.

Young Vines.—Growths on canes planted in spring should be stopped when they are about six feet long; the resulting leading growth should be allowed to extend to the top of the house and then be again stopped. Tie in the shoots regularly, in order to prevent injury occurring to the leading growths. Pinch back all side growths to one leaf. Syringe the vines frequently and afford abundance of air. Vines that were recently planted while in a growing condition should be kept moderately moist at the roots until they have rooted freely in the new border.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Rhododendrons.—As soon as Rhododendrons have passed out of bloom lose no time in removing all seed pods, as these are very weakening to the new growths. Top dress, if necessary, very choice plants and prune straggling growths. The variety Pink Pearl makes a brilliant display of large trusses, and is always admired.

Carnations.—To obtain large blooms, every attention must be afforded these plants, especially in dry weather. Give the roots liberal supplies of water, with liquid manure at intervals. Dis-

bud freely and tie the flowering stems neatly to suitable stakes. If large quantities of Carnations are grown to provide blooms for cutting, twigs of Birch or other trees may be placed around and among them instead of using stakes and ties.

Herbaceous Borders.—The warm dry weather will injuriously affect late-planted subjects and plants with roots near the soil surface unless water is given them freely. Liquid manure should be given to the roots at intervals. In many gardens the water supply is inadequate to meet the requirements of large, well filled herbaceous borders, and as a consequence the plants fail to produce a fine effect. Heavy waterings, mulching and frequent hoeing will keep the plants in active growth and assist them to produce a good supply of flowers. Support all tall growing subjects early and as neatly as possible. Remove dead foliage and the faded flowers of early-flowering plants and fill up open spaces with plants suitable for continuing the display.

Roses.—Now that the flowering season is at hand special attention must be given to Roses it fine flowers in abundance are desired. Disbudding should not be overlooked. Thin out weak shoots and remove suckers, hoe the surface soil freely, water and mulch the soil as necessary, and syringe the trees overhead occasionally, late in the afternoon, with a suitable insecticide, to destroy aphis and other pests.

Spring Flowers.—If seeds of Wallflowers and other spring-flowering plants have not been sown, the work should be delayed no longer. Make the seed bed firm and moist, and if the weather proves dry after sowing place mats over the beds to conserve moisture, but remove them immediately the tiny seedlings appear.

Lawns.—Give careful attention to all newly-turfed or newly-sown lawns. The latter should not be mown too closely or the roots will be exposed to the full influence of the sun. Watering may be necessary but give a thorough soaking in preference to small quantities at short intervals.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Carrots.—A sowing of short-horn Carrots should be made on narrow borders for the supply of succulent roots throughout the late autumn months. If the site has yielded a crop of early Potatos, very little will be needed in preparing the ground, except working it finely and dusting the drills with sifted burnt garden refuse. Draw the drills 14 inches apart and 1½ inch in depth, and water them before sowing the seeds. Inimitable and Golden Ball are useful small sorts and Scarlet Horn and Early Gem are a little larger, but of fine quality. Hoe the ground frequently, and afford occasional dustings of soot after the seedlings appear.

Onions.—Onion seedlings planted out from boxes are growing rapidly; they revel in the hot weather, provided they are moist at the roots and the Dutch hoe is used frequently between the rows. It is very beneficial at this date to give the bed a slight mulch of leaf-soil or very light, decomposed manure. Onion fly and Onion mildew must be guarded against. It will do the plants no harm if slaked lime is strewn broadcast over them before either of these pests appear; mildew very seldom attacks plants after this treatment. The main crop Onions will respond to the above treatment, and in both cases occasional dressings of some concentrated fertiliser or sulphate of ammonia should be given.

Peas.—Especial care is needed to obtain late Peas. Open sites are to be preferred as less mildew appears than when the sowings are made in close, walled-in gardens. Trenches should be made and manure, with bone meal, or superphosphate of lime, added to the soil. Make the whole firm and sow the seeds as soon as the site is ready. Gladstone, Latest of All, Autocrat and Rearguard are most reliable late varieties of Peas.

Leeks.—Leeks that are being grown for exhibition purposes will now be elongating their stems. Encourage them to extend by means of brown paper collars 8 inches in length and 2 inches in diameter; gradually draw these collars up as the stems lengthen, adding fine soil below but never allow the soil to reach the heart or centre of growth. Continue this process until the desired length of blanched stem is attained, when the collars should be removed entirely, the soil being then made firm and secure.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Mignonette.—The large-flowered, giant-spiked and pyramidal varieties of Mignonette are indispensable for greenhouse and conservatory decoration. Seeds sown now will provide early autumn flowering plants. Sow the seeds in the pots the plants are to flower in, and thin the seedlings to about six in a pot. Fill the pots with a mixture of loam, leaf-mould, mortar rubble and wood ash, and when the seeds are sown place the pots on an ash base in a cold frame with a north aspect. When Mignonette seedlings are growing freely syringe them daily. Pinch out the early flowers until the desired symmetry is obtained, and place twigs of Birch round the edges of the pots to support the plants. When fully established give Mignonette frequent waterings with liquid manure.

Euphorbia pulcherrima and E. jacquiniaeflora.—Cuttings of these useful winter-flowering plants should now be taken, with a heel of the old wood, and inserted singly in small pots in sandy soil. Plunge the pots over bottom heat, keep the cuttings shaded until rooted, and spray them twice daily. When rooted place them on a shelf near the glass and afford them more light and air.

Begonia Gloire de Lorraine.—Cuttings of this Begonia may still be taken and successfully rooted in sandy soil in well-drained pots. Fill the pots with cuttings, and place them near the roof glass, but give them shade from sunshine. Earlier cuttings, now rooted, should be potted singly in 3-inch pots and placed on plant staging that is covered with ashes. For potting, use a mixture of loam, peat and sand, and pot rather loosely. Keep the plants in a temperature of not less than 60°, syringe them daily, and keep the staging and paths moist. As a preventive against insect pests fumigate the Begonias occasionally and dust some soot amongst the pots.

Ixora.—Plants showing flower—provided there is a desire to prolong the period of flowering—should be placed in a cooler house and given less water and ventilation.

THE ORCHID HOUSES.

By G. H. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Cymbidium.—The best species and hybrids of this genus occupy a foremost position among useful Orchids for late winter and spring displays. During the last few years some elegant hybrids have been raised from the beautiful C. insigne, a species which has proved valuable as a parent of a new section of these charming plants. The lasting qualities of the flowers, either on the plant or in a cut state, is well known, but for the benefit of the plants the spikes should not be allowed to remain on too long, and all should have been removed ere this. Cymbidiums are mostly strong-growing plants, with thick, fleshy roots, and all through the season of active growth the roots require plenty of moisture. Some recommend giving an abundance of water to the roots, but I prefer, at all times, to treat Cymbidiums as ordinary greenhouse plants, always allowing them to become somewhat dry before giving a thorough watering. The principal causes of failure with these Orchids are over-watering the roots, too much shade, and a stuffy atmosphere. While a cool, intermediate temperature is proper for them, they do not mind sun heat by day provided this is accompanied by abundance of fresh air and plenty of atmospheric moisture, and there is a cool atmosphere at night to recuperate in. They must be shaded from the direct rays of the sun, and in bright weather the syringe should be freely used about the foliage, a good spraying with clean water being the most effectual way of keeping down red spider, a pest which sometimes attacks the undersides of the leaves during hot, dry weather.

Repotting.—New growth has now commenced, and any necessary repotting should be done at once. Refrain from disturbing any plants so long as the soil is not sour and there is sufficient room for development. Plants in a root-bound state are always most productive of flower-spikes. If large specimens are desired, healthy plants should be given a moderate shift every two years, while young healthy seedlings require annual potting up to the time they reach the flowering stage. Where large specimens are in a bad condition they should be divided and the best portions, with new leads, potted separately. The pots should be well drained, the crocks covered with a thin layer of turf, and the plants potted like ordinary plants—that is, with the pseudo-bulbs resting on the surface of the soil just below the level of the rim of the pot. The mixture for potting should be composed of good loam fibre one half, peat or A.1 fibre one quarter, leaf-soil and chopped Sphagnum-moss one quarter, with plenty of crushed crocks, charcoal and coarse silver sand added to keep the mixture porous. The material should be carefully worked among the roots and made moderately firm. If the soil about the roots of the plants is in a moderately moist state, and the new material is employed in a similar condition, watering should not be necessary for a week after repotting. Then give a thorough soaking of water, which should suffice for some time. The usual precautions against over-watering must be taken with newly-potted Orchids, especially with those that have had all the material shaken from their roots, and extra shade should be given them when the sun is bright.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Protecting Cherries from Birds.—Nets should be placed over the trees as soon as the fruits begin to swell, as birds take them very early, especially if the weather is hot and dry. Small meshed netting is best as it will keep out the small birds. Over wall trees the nets should be fastened at the top and pegged down at the bottom, and where there is no coping sticks should be used to keep the netting well away from the wall, otherwise blackbirds will settle on the net and peck the fruit through it.

Feeding Fruit Trees.—All trees that have set heavy crops should be liberally supplied with water and receive liquid farmyard manure once a week at least, but this should never be given at too great a strength. More harm may be done by giving very strong liquid manure than if none at all is given. Trees carrying heavy crops should also have good mulchings of manure, or, if this is not available, litter or grass mowings should be spread over the root area to keep the sun from drying the surface severely.

Propagating Strawberries.—The best method of propagating Strawberries is by layering the runners as soon as they are large enough. The earlier the runners commence to root the better will be the plants for forcing. Three-inch pots should be used as they may be easily removed from the beds when the runners have rooted. One crock should be used to cover the drainage hole, with some rough fibre over it; then fill the pots with loamy soil passed through a half-inch riddle, with a little leaf-soil added. Choose the strongest runners from the best fruiting, one year or two-year-old plants. Each layer should be pressed into the soil in the pot and fixed with either a wire or wooden peg. Bracken stems make excellent pegs for this work. The soil in the pots should at no time be allowed to become dry. All superfluous runners should be removed.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JUNE 17—
Royal Horticultural Society's Committees meet. Lecture at 3 p.m.; by Mr. H. E. P. Hodsoll on "The Care of the Plant."

WEDNESDAY, JUNE 18—
York Gala (three days); Gardeners' Royal Benevolent Institution, Festival Dinner at the Grocers' Hall, City, E.C.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 59.8°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday,* June 11, 10 a.m.: Bar., 30.3; temp., 76. Weather—Bright.

The Sun-Drying of Vegetables. The duress of war induced many people in this country to practise forms of thrift hitherto disregarded, and among them was what may be called the home-drying of vegetables. On a larger scale also the drying of vegetables was carried out in order to provide the prescribed rations for H.M. Forces. The technique of drying is simple and when drying is practised with care and attention to detail a product is obtained which is of good appearance and almost as palatable as the fresh vegetable. The reduction in volume and weight brought about by drying, together with the long-keeping property of properly dried vegetables make them an extremely convenient form of food for large bodies of men.

But researches carried out at the Lister Institute by Dr. Chick and her colleagues indicate that dried vegetables, at all events as prepared in this country by ordinary commercial methods, are deprived in the process of drying of those health-maintaining substances known as vitamines which are Nature's medicines against such diseases as scurvy. This discovery, although perhaps of no great importance so far as the domestic use of dried vegetables is concerned, for such vegetables could in ordinary cases only form a small part of the daily ration and other fresh vegetable food would supply the vitamines, is of first rate importance when the feeding of armies is concerned. For in the difficult circumstances which obtain in the field, reliance would tend to be placed exclusively on the food materials most readily available. Where that is the case and where vegetables only in the dry state are used the health of armies suffers.

It is, therefore, of peculiar interest that according to investigations carried out into the drying of vegetables in India (Quetta) when sun heat is used, the dried product retains its anti-scorbutic and anti-beri-beri vitamines.

The experiments* which were conducted by Mrs. Gabrielle Howard on behalf of the Indian Army Authorities at the Fruit Experiment Station at Quetta, demonstrate that sun-drying in the hot and windy hill country of Baluchistan is remarkably successful and this no doubt because it takes place so rapidly. In these experiments, both the commoner vegetables, Spinach, Peas, Tomatos, and also certain Indian vegetables were dried, all apparently with complete success. Inasmuch as vegetable growing can only be carried out in the neighbourhood of Quetta during the "summer," there should be in drying a means of providing supplies of vegetables for local winter consumption. It should also be possible to develop a vegetable drying industry for the supply of other parts of India at periods when fresh vegetables are unobtainable.

But the results obtained at Quetta are of yet wider interest for they show first that there is in sun-drying a ready means of obtaining supplies of wholesome food, not only in India, but also in such countries as Egypt, and when it is remembered that the sun-dried vegetable may be briquetted—compressed into consolidated and easily transported form—the problem of supply to armies would appear to have been solved.

Furthermore, if sun-drying does not destroy the vitamines it would appear certain that artificial drying could be so improved as to prevent the destruction of the vitamines which is said to take place under the conditions at present used in commercial drying machinery. A useful piece of work, therefore, would be to determine by what change of procedure commercial drying may be made to yield a product with the health-giving qualities unimpaired.

In any case, with this information now available at their disposal, the army authorities should be able to provide, in the regrettable contingency of another war, for the supply to the troops in the field of full rations of wholesome dried vegetables.

The Sun Drying of Vegetables, by Gabrielle L. C. Howard, Fruit Experiment Station, Quetta Bull. No. 8, March, 1918.

Fruit and Vegetable Growing by Ex-Service Men.—At Shippea Hill, near Lakenheath, Suffolk, 25 ex-Service men are receiving practical instruction in fruit and vegetable growing. The next course, which will last 8 weeks, commences on July 7, and ex-Service men desiring to enter for it should apply to the Secretary, Board of Agriculture, 72, Victoria Street, London, S.W.1. Ex-Service men receive allowances during their period of training; and an extra allowance is given to married men.

American Gooseberry Mildew.—The appearance of the summer stage of American Gooseberry Mildew has been unusually late this year, doubtless owing to the dry weather, the first report of it having been made the week before last. It would be interesting to know whether the district in which the outbreak occurred (in Sussex) was one of those in which rain fell on Sunday, May 25. Information on this head would be valuable in helping to determine whether this fungus depends for its initial spread on rainfall, or whether it may occur even during a spell of drought. It is to be hoped that those amongst whose Gooseberry bushes American Gooseberry mildew occurs will take every means of checking it. Spraying with lime sulphur or ammonium sulphide is undoubtedly efficacious; so is spraying with weak Burgundy mixture. These means of control together with tipping, should by no means be neglected.

Gardeners' Royal Benevolent Institution.—Mr. W. Priest, gardener at Eglinton, Kilwinning, has forwarded postal orders to the value of £1 11s. 6d., from himself and other members of the garden staff at Eglinton, for the Gardeners' Royal Benevolent Institution, in response to the Hon. Treasurer's appeal for funds in the issue for May 10, page 230.

Croydon Horticultural Society's Exhibitions.—On Wednesday, 25th inst., the Croydon Horticultural Society will hold a flower show in the Park Hill Recreation Ground (by permission of the Corporation of Croydon), and on Saturday, July 19, an exhibition of vegetables and fruits in the Public Halls, George Street.

New Fertilisers Order.—By "The Acids and Fertilisers (Suspension) Order, 1919," from June 1, 1919, until further notice, the operations of the several Orders heretofore made by the Minister of Munitions, the dates and short titles of which are specified in the first two columns of the schedule hereto, controlling the materials or articles specified in the third column of the same schedule are suspended, but such suspension shall not affect the previous operation of any of the said Orders nor the validity of any action taken under any of the same, nor the liability to any penalty or punishment in respect of any contravention of or failure to comply with any such Orders prior to this suspension nor any proceeding or remedy in respect of any such penalty or punishment.

Date of Order	Short Title.	Materials or Articles controlled
April 30, 1918	Fertiliser Prices Order 1918...	Superphospate, Sulphate of Ammonia, and Ground Basic Slag.
June 4, 1918	Compound Fertiliser Order 1918... ...	Compound Fertilisers
May 29, 1917	Sulphuric Acid Order 1917...	Sulphuric Acid.
May 10, 1918	Sulphuric Acid (Amendment of Prices) Order 1918...	Do.
Nov. 8 1918	Sulphuric Acid (Amendment of Prices) No. 2, Order 1918...	Do.

A Useful Innovation at Kew.—Always an interested visitor to Kew, it was a happy and much appreciated suggestion of the Speaker of the House of Commons to have notice boards put up at the principal entrance gates at Kew recording the most interesting "objects of interest" from day to day. By the side of the subjects named is a plan of the gardens, and against each item a reference number to the plan is given. This week attention is called to Davidia laeta, Rosa Hugonis, the Alpine House, the Rock Garden, rare Rhododendrons near King William's Temple, the Crataegus family, the Blue Water Lilies in House XV., and the Rhododendron Dell.

Hampton Court Gardens.—The First Commissioner of Works, Sir A. Mond, has appointed an expert committee to consider (1) whether any suggested alterations to the Hampton Court gardens are desirable, and (2) if so, what changes the Committee would recommend for consideration. The six members of the Committee are Sir Aston Webb, President of the Royal Academy, Chairman; Col. F. R. S. Balfour, nominated by the Royal Horticultural Society; Mr. W. Watson, Curator, Royal Gardens, Kew; Mr. Robt. Wallace, Colchester, landscape gardener; Miss Willmott, V.M.H., Warley Place, Great Warley; and Mr. Ernest Law, the historian of Hampton Court.

Queensland Fruit Production.—As fruit preserving and fruit transportation become perfected, the more distant British Dominions like Queensland, which is one of the most fertile and productive areas in the world, will undoubtedly be called upon to contribute to Britain's and Europe's supplies. Every year sees an increase in the area of land devoted to fruit-growing in

Queensland, the greatest attention being paid to Citrus fruits, Pineapples and Bananas, and in the districts west of Toowoomba, Apples, Pears, Apricots, Peaches and other deciduous fruits. There are three distinct fruit-growing belts in the State. First, the eastern seaboard, and the land adjacent to it, suitable for the raising of purely tropical and semi-tropical fruits. Next in order come the coastal table-lands, suitable for the growth of deciduous fruits such as Apples, Pears, Plums, Cherries, Grapes, Olives, Figs and, in many parts, Citrus fruits, but requiring, in certain districts, water for irrigation. Of late years, the northern table-lands in the neighbourhood of Atherton and Herberton (2,000 feet above sea level) have come largely to the front in the production of most fruits of temperate climates. A late return, issued by the Government statistician for the year ending June 30, 1917, gives the following information as to the results of fruit growing in the Atherton district:—Bananas, 29 acres, 3,877 bunches; Pineapples, 4 acres, 338 dozen; Oranges (bearing), 10 acres, 980 bushels; Oranges (not bearing), 12 acres; Mangoes (bearing), 3 acres, 245 bushels; Mangoes (not bearing), 4 acres; Apples, 2 acres; Peaches, 7 acres, 195 bushels; Plums, 1 acre, 2 bushels; Lemons, 5 acres, 415 bushels; Papaw Apples, 4 acres, 718 dozen.

National Horticultural Society of France.—At the first exhibition, since the war, of the National Horticultural Society of France, in Paris, on June 5 to 9, Messrs. Dobbie and Co., Edinburgh, were awarded a large gold medal and a Prix d' honneur for a large exhibit of Sweet Peas. Mr. Bruce Macfie and Mr. David Cuthbertson represented the firm on this occasion.

The Kew Flagpole.—In the hope of having the Douglas Fir spar ready for flying the Union Jack during Peace celebrations, preparatory work in connection with its erection commenced on Monday, May 26. The new pole is to occupy the site of its predecessor, which was also obtained from British Columbia. Compared with the first flag-staff which was 159 feet in length, the present one is much more bulky and has a length of 214 feet. Canadian officers are taking an active part in the arrangements in consultation with H.M. Office of Works.

The Wages Board and "Summer" and "Winter" Time.—According to Clause 5 of the Order varying the minimum rates of wages at present in force for male workers of eighteen years of age and over, throughout England and Wales, for the purpose of the hours of work on which the weekly minimum wage is based, "summer" is defined as the period commencing on the first Monday in March and ending on the last Sunday in October, and "winter" as the remainder of the year, with the exception of certain special classes of workers in Derbyshire. The Wages Board have no power to fix the hours of labour, and consequently the number and arrangement of working hours are a matter for mutual agreement between employer and worker, subject to the time worked being paid for at not less than the minimum rates applicable to the worker concerned under the Wages Board's Orders. Minimum rates of wages fixed by the Wages Board apply to all classes of workers employed in "agriculture," in accordance with the definition of that expression contained in the Corn Production Act, wherein it is expressly defined as including employment in market gardens and nursery grounds.

The Hay Control.—In view of enquiries which continue to reach the Board of Agriculture with respect to the control of hay, we are asked by the Board to explain that the hay control is not exercised through the Board of Agriculture. The lifting, use, price and distribution of hay and straw are regulated by an Army Council Order and Regulations thereunder. So far as civil supplies are concerned, all arrangements are made by Forage Committees in each county. These Forage Committees, on which both the producers' and consumers' interests are represented, act under the direction of the Central Forage Council for Civil Supplies. Owing to military requirements and the absence of foreign hay from our markets, supplies are very short; and the Central Forage Council has great difficulty in making adequate and regular provision for towns and non-producing areas generally. The Government, it is understood, proposes to decontrol hay as soon as this course is practicable.

Checking Apple Mildew.—Considerable loss is caused by Apple Mildew in some specially susceptible varieties of Apple, and reports received by the Board of Agriculture show that it is very prevalent in some districts this year. Among the varieties reported as being attacked are Bismarck, Lane's Prince Albert, Allington Pippin, and Cox's Orange Pippin. Experiments have shown that Apple Mildew can be kept under control if proper measures are adopted. After wintering in the buds, the mildew appears as these unfold in the spring. This is known as "primary" infection, and no spraying will prevent its development. Where possible, all infected buds should be cut off so soon as they are seen and burnt. "Secondary" infection by spores from this first infection may be controlled by spraying with lime-sulphur, made by mixing 1 gallon of concentrated lime-sulphur (1.3 specific gravity) in 30 gallons of water. In the case of Cox's Orange Pippin, however, half the strength should be used (viz., 1 gallon of concentrated lime-sulphur to 60 gallons of water). The Board of Agriculture gives further particulars of the spread and control of this pest in Leaflet No. 204, which may be obtained, free of charge, on application to the Secretary, 3, St. James's Square, S.W.1.

ANTHURIUM PFITZERI.

One of the most enthusiastic gardeners I have ever met is William Pfitzer, nurseryman, Stuttgart. He was at Van Houtte's nursery when a young man, some forty odd years ago, and Sir Frederick Moore, of Glasnevin, was there at the same time. It was only natural, therefore, that when Sir Frederick and I were "doing" the botanic gardens and nurseries of Germany, etc., in 1907, Stuttgart should be visited, and we had a most interesting time with Pfitzer in his nurseries, which were well stocked and cleverly managed. Among the plants obtained there for Kew was a hybrid Anthurium, which the raiser, after whom it was

Fig. 147.—Anthurium pfitzeri.

named by Engler, kindly presented to Kew, where every year since it has been one of the most attractive of the large-leaved Anthuriums. Its parents are A. Warocqueanum and A. crystallinum, and it is a happy blend of the leaf characters and habit of these two large-leaved species, the leaves measuring 4ft. by 20in., and their colouration being that of A. crystallinum, which is dark velvety green with silvery veins; their crinkliness is inherited from the other parent. The plant represented in Fig. 147 is growing in a low rock bed over the water tank in the Nepenthes house at Kew, where it revels in the heat and moisture provided for the ultra-tropical inmates of this house, which include Calatheas, Costuses, Alocasias, Fittonias and such-like foliage plants. *W. W.*

NURSERY NOTES.

IRISES AT COLCHESTER.

By the invitation of Messrs. R. Wallace and Co., we were afforded the opportunity, on Thursday, the 5th inst., of inspecting the firm's summer-flowering Irises at Colchester. The Kilnfield Nurseries, as they are termed, are devoted entirely to hardy, flowering plants, including Alpines and ornamental trees and shrubs, especially such as are suitable for associating with rock and water gardens, which are the firm's specialities and for which they have gained high awards at exhibitions. In common with most nurseries of this character, only a minimum amount of labour has been available during war-time for the cultivation of the extensive stocks of flowering plants, the care of the extensive water and bog garden, the dry wall, which on our last visit we found so exceedingly interesting, and the upkeep of the necessary glass-houses which a nursery of this character includes. But the most had been done that was possible, and although it would require a vast amount of time and labour to bring the place back to the neatly-ordered condition of pre-war times, we found much that was interesting and the Irises especially were in their full beauty and provided sufficient to interest and admire throughout a long day.

It would be a difficult matter to decide which is the finest flower for gardens in summer time, but surely the claims of the summer-flowering Irises would make them rank high in any list, whilst it would be difficult to name any plant that produces such gorgeous flowers with less care and attention from the grower. The summer Irises have an old-world charm, for they were favourites with our forebears, and they seem always to be found in the beds and borders of old-time establishments where the gardens seem as though they owe less to design than to a happy association of beautiful plants with the natural amenities of woodland and water.

During recent years the hybridist has so intermingled the various tall, flowering Iris species such as pallida, plicata, neglecta and squalens, that it is almost a matter of impossibility to keep them grouped accurately, and the modern tendency is to lump them into one big group under the general title of late-flowering bearded Irises. The late Sir Michael Foster, as is well known to our readers, was very successful in raising beautiful hybrids, and many of his novelties have been illustrated in these pages. His work, although not perhaps on the same lines, has been continued by others, including Mr. W. R. Dykes (whose beautiful Goldcrest (see Fig. 148) was flowering in its full glory at Kilnfield Nurseries on the occasion of our visit), Mr. A. J. Bliss and Mr. Farr. The varieties were so numerous that we have space only to enumerate some of the newer ones, including many which have not yet been placed in commerce, and for the most part Mr. Bliss's productions. Perhaps the finest variety in the whole of this very choice collection is the one named Dominion, with a fine spike of large flowers, each bloom having glorious falls of violet purple with a maroon sheen, the base having pretty reticulations passing to chestnut red colour, and with standards of heliotrope blue; a rich gold beard forms a pleasing finish to the blooms. The habit is sturdy and dwarf, and if a fault is to be found it lies in the rather heavy [illegible] of the inflorescence. The variety named Rodney is quite distinct, for the colour is Oxford blue and the flowers are smaller and the segments narrower than usual, but of a delicate and refined appearance that appeals to the lover of the beautiful. The blooms are borne on very straight stems and with great freedom; the habit of the plant is very neat. Sweet Lavender has standards of pale heliotrope colour and broad, reddish purple falls. The colouring is quite distinct and, as the plant produces blooms in plenty and each flower is of the largest size, the effect of a bed of this variety is exceedingly fine. Francina is a white flower with heavy reticulations of reddish purple and it has also a little colour in the standards, the edges of which are pleasingly turned backward. Tatarin is another flower of bold appearance, with broad, purplish heliotrope falls and a prominent orange beard on a pale ground; arising above these are pale blue standards of the largest size. The next variety that came under notice was Rosalind, of which there was a big clump, the plants giving a generous display of their pretty flowers of a rosy shade, with a deeper tone in the falls, which are reticulated at their bases. There is considerable gold colouring in this variety, both in the beard and in the style arm. Tristran is a dwarfer-habited plant than most, but its small stature does not detract from the beauty of the flowers; the falls are deep maroon, with reticulations, and the standards are blush colour. Drake may be described as a counterpart of Rodney, but instead of Oxford blue the colour is Cambridge blue. The spikes carry large, bold flowers, and grow as much as three feet six inches high.

In the variety Phyllis Bliss, which is one of the choicest of Mr. Bliss's productions, the young flowers open a rather deeper shade than is seen in the fully expanded blooms. The tone is perhaps best described as lavender, overlaid with rose, and there are reticulations of purple. The long, drooping falls are not quite so wide as the standards. E. H. Jenkins may be described as a bicolor Catarina. The very broad, purplish lavender falls have brown reticulations at the base, on a white ground; the large, waved standards are sky blue colour. The plant is very free in blooming, and has the habit of branching freely, so that a small specimen will bear a great profusion of blooms. A rather unusual form was seen in the variety Clematis, for instead of having a well-defined standard, the segments hang down as in the falls, and, moreover, the standard segments have beards, so that the flower must be regarded as an abnormality. The effect was that of a more regular flower than is usual in Irises, and it is from this fact that the name Clematis was given to it. One of the freest blooming of all was named Azure, which possesses rich, purple falls, reticulated at the base, and azure blue standards.

The large, branching inflorescences of Camelot bear flowers having a creamy-white ground, faintly suffused with blue at the edges of the falls, and with more blue in the standards. The flower is rather unique in that it fades with age almost to cream-white. Gules is a variety with claret-colouring in the falls, and brown veining towards the limb and under the prominent orange beard. The very broad standards, which are of a purplish lilac colour are much arched. Dimity is a very delicate flower having faint reticulations of purple on a cream ground, and with pale lavender-coloured standards showing a white ground. The variety blooms with freedom, and the plant possesses a robust constitution. One of the gems of the whole collection is what appears to be a Cengialtii seedling, and is appropriately named Tomtit from its dwarf stature. The falls are more horizontally spread than in most varieties, and the whole flower has a rich, purplish shade which, seen in the mass, gives an impression of deep violet blue. The foliage has a rather peculiar drooping character, which marks the variety as distinct. In Cretonne, we have a flower giving a more bizarre effect, the falls being crimson maroon with

FIG. 148.—IRIS GOLDCREST: FLOWERS BRIGHT VIOLET-BLUE, WITH GOLDEN BEARD.

chocolate veining and carrying a fine orange-yellow beard. The standards are of a violet shade edged with bronze. Quite distinct from the foregoing is one named Mrs. H. Cowley, a flower with very broad, rounded falls of vinous red colour, with white veining at the base. The standards are gold-coloured at the base, the blade being faintly suffused with mauve on a bronze ground. Morwell is one of the older varieties already in cultivation in gardens. The large flowers have purple falls, and pale, clear blue standards; the spike is very large and branching, and the segments are also of large size.

Blue Bird derives its name from the spreading falls, which appear like deep blue wings, adorned by a rich gold crest. It has a paler blue standard. Knysna is one of the best of the variegata forms, and quite distinct from any others in cultivation. Above the deep chocolate-coloured falls arise tall, golden-coloured standards, with a little veining on the inner surface of the segments. The habit is dwarf, sturdy and very free-blooming. Dora Longden is another dwarf Iris, the colour of which is rosy-magenta at the base of the falls, which have a considerable amount of veining, the tone passing to chestnut brown under the rich gold crest. The standards are faintly flushed with lilac, and are bronzy at the base. Mrs. G. F. Tinley is a very large variety, with blooms of massive proportions. The falls are purplish violet, on which the orange-coloured beard shows prominently, and the beautifully arched standards are lavender-coloured.

The Irises described above by no means exhaust the list of varieties noted, but we can only give a selection of some of the older sorts we saw and with which many of our readers will be familiar. They include Shalimar, Alcazar, Isoline, Troost, Mrs. Alan Gray, Iris King, Eldorado, Dawn, Lord of June and Celia.

FLORISTS' FLOWERS.

THE SWEET WILLIAM.

Though often regarded as an old-fashioned flower, Dianthus barbatus, the Sweet William, is nevertheless intrinsically beautiful, and on account of its hardiness and freedom in flowering should be grown in every garden. Seeds may be sown any time in May or June. Where the soil or climate is such that germination takes a long time early sowing is advised. I have had excellent results from a sowing made about the middle of May. The usual preparation of the soil for seed sowing is needed and shallow drills should be made one foot apart, the seeds being thinly scattered therein and covered with fine soil. There will probably be other seeds sown at the same time, including Canterbury Bells, Wallflowers, Myosotis, Daisies and Polyanthuses, so that the whole bed when completely sown, and raked level, may be covered with a protecting net. By sowing thinly and allowing a distance of 12 inches between the rows, firm, dwarf, sturdy plants are obtained, there being abundant space for hoeing between the rows, keeping the seedlings clear of weeds and allowing air and sunshine to reach the plants freely. If more seedlings appear than are required, they should be thinned at an early stage. The protecting net should be removed and the soil between the rows loosened with a Dutch hoe as soon as the seedlings are well through the soil. If the plantlets, despite the thin sowing and subsequent thinning, show a tendency to crowding, they should be transplanted. By that time it is probable that some of the earlier vegetables will be harvested, and the ground released, when cleaned and made fine, will form a suitable nursery bed for the plants. Before setting them out a slight dusting of the surface soil with superphosphate of lime will have a beneficial effect. If the seed drills are dry at the time of transplanting, it would be wise to water them an hour or two previous to planting and then lift the seedlings with a small hand-fork. The distance between the rows will depend on the space at disposal. A distance of 12 inches will admit of frequent hoeings, but where so much space cannot be spared the plants may be set in eight rows at 6 inches apart, and a space of 12 to 18 inches left before planting another eight rows. This method, whilst economising space, will enable the plants to be reached for cleaning purposes. One, or at most two, waterings should suffice until the plants can be transplanted, in October or November, in well worked and enriched soil. Plants treated as described should easily fill the space if set out 18 inches apart. A measure of intensive flower cropping may be practised by setting the plants squarely at 18 inches apart and midway between every four plants setting a plant of the common purple Aubrietia raised from seeds early in the summer and duly pricked off. These will flower in the spring and, having no great value, may then be removed. In this way a double display of flowers may be obtained on the same plot.

A splendid mass of colour may be produced by growing self-colours of such varieties as Pink Beauty, Sutton's Scarlet and Sutton's Giant White. If a large bed or border is filled with Pink Beauty a very pleasing edging would be a double row of Nepeta Mussinii. If the beds are filled with scarlet Sweet Williams Cerastium tomentosum would form a suitable edging, and the colour in the inner part of the border may be toned down by groups of Giant White placed 6 to 8 feet apart. Seeds may be saved of the best flower heads, or rooted cuttings may be taken off the old plants in the succeeding autumn and re-planted for fresh stock. *William F. Rowles.*

MIGNONETTE.

There are gardens in which it is well-nigh hopeless to sow Mignonette. The ills to which this popular plant fall victim have not, I think, been sufficiently studied, but, whether it is some deficiency in certain soils or some insect pest, the crop can generally be saved if the bed, or border, is thoroughly soaked with strong lime water before the sowing is done. Sprinkling with lime is less efficacious. Two ounces of lime to one gallon of water is the correct quantity: the seedlings may be watered with a solution half this strength when they are an inch high. The incorporation of vegetable charcoal with the soil is a great help to Mignonette. *M. H.*

SUMMER MANURING.

However well soil may be cultivated during the winter, it is a recognised fact that crops reach a higher state of perfection, with a corresponding increase in the yield, if manuring in some form is practised during the summer months. In gardens where the routine of soil preparation was only partially carried out last winter, owing to labour difficulties, steps should be taken to supply crops with the necessary fertilisers to ensure a fair yield.

Where there is an ample and handy water supply fertilisers in liquid form are easily applied, but where this method is impracticable, fertilisers have usually to be applied in a dry state. For most garden crops the time-honoured fertiliser made by plunging in a tank of water a coarse sack three-parts filled with either cow, sheep, or deer manure is a valuable aid, and were it available and could be used freely it is questionable if outdoor crops would need any other assistance than it affords during summer.

Unfortunately, in only a few gardens is such liquid manure available in quantity, and chemicals have to be substituted. There is satisfaction in knowing that this is not at the expense of the crops, but rather the reverse, owing to the success manufacturers have met with in preparing effective fertilisers economical in use. Most of the proprietary fertilisers may be used in a dry state, but the directions that accompany them should be adhered to whether they are used dry or in liquid form.

Some difficulty is experienced in obtaining chemical manures in certain forms, but when obtainable and carefully used most of the popular kinds are highly beneficial for summer use. Among these, phosphate of potash and nitrate of potash are fairly well known, and are useful when combined together. For the exhibitor of fruit and flowers who does not always require a complete manure phosphate of potash is suitable for securing a superior "finish" to fruit and to such flowers as Carnations, while for Roses and similar gross feeders, nitrate of potash provides a capital stimulant, used at the rate of ½oz. to 1oz. per gallon of water. The stimulating effect that nitrate of soda has on plants grown chiefly for their leaves and stems makes this chemical almost indispensable in gardens, but to obtain the best results from its use it should be applied "little and often," and more freely in a dry season than in a wet one. Extra care should be taken when it is found necessary to use it on crops that have to stand the winter, because if used too freely it causes a luxuriance of growth that has a poor chance of withstanding the biting winds, wet weather and frost of an average winter without suffering. Half an ounce to a gallon of water is strong enough to begin with, but for crops that reach maturity in good weather this amount may be subsequently doubled.

Sulphate of ammonia, sulphate of potash and superphosphate are manures which, though not as rapid in action as the foregoing, are nevertheless useful for summer use in solution. Together, they form an economical food for outdoor crops generally, mixed at the rate of 2lbs. of each of the two first-mentioned to 7lbs. of the last, and applied at the rate of ½oz. to 1oz. in each gallon of water.

In a dry season, keeping the roots of plants as cool and moist as possible goes a long way towards obtaining the best results. Once the soil has become thoroughly warmed, mulching, where possible, should be practised. The free use of the Dutch hoe is essential at all times, not merely for the destruction of weeds, but to prevent the escape of valuable moisture.

Where watering on an extensive scale is impossible, the grower may do much to improve the condition of all crops, and the beauty of the summer displays of flowers, by judicious top dressings of good fertilisers and chemicals in a dry state. After distributing the fertiliser the ground should be well hoed and, if possible, showery weather should be chosen for making the application. In this way nitrate of soda will prove valuable sown at the rate of ½oz. to 1oz. per square yard; superphosphate two parts, and one part of sulphate of ammonia applied, from 3oz. to 6oz. per square yard, may be used with good effect on all crops; while for fruit trees a useful dressing is three parts of superphosphate to one of muriate of potash, or the sulphate of potash. *F. J.*

VERONICA FILIFORMIS.

Most books of reference and catalogues are silent on the subject of Veronica filiformis, a pretty Speedwell which comes from Asia Minor, which I grew first some fourteen or fifteen years ago. It has since come occasionally under my notice, but nowhere have I observed it so fine as in the wall garden of Sir Herbert Maxwell at Monreith, where so many good alpines find a congenial home. In such a wall garden, with a good bank of earth behind, it seems perfectly happy, as it is also in a cool crevice of rockwork, although it can do with a fair amount of sun if not parched at the roots. I well recollect, when I first saw the plant in flower, how much I rejoiced at its fairy-like habit, its charming, fine foliage and its exquisite little blue flowers. It loves to hang slightly down over the rocks or stones, but there is nothing aggressive about it, while it can be planted beside the choicest alpine without any sense of incongruity. When I last saw it, Sir Herbert Maxwell's plant was a magnificent specimen and an object of much pleasure even when out of flower, but of extreme grace when in bloom. V. filiformis is apparently quite hardy, and will last for years with fair treatment, but it must not be choked or overrun by other and stronger growing subjects. It is increased readily by means of cuttings. Many of the Veronicas are capital garden plants and V. spicata Royal Blue, which lately came under notice, is very suitable for massing. *A.*

FORESTRY.

THE BLACK WALNUT..

Amongst the various broad-leaved trees suitable for experimental planting for the production of timber Juglans nigra, the Black Walnut, may be suggested as one of the most likely to produce timber of high commercial value. Its successful cultivation will probably be limited to regions where the common Walnut (J. regia) thrives, but that offers a fairly wide range of country in Britain, for well-developed trees are to be met with in various parts of Scotland, even though the nuts do not ripen with the same regularity as in the south of England. In many parts of this country it may be expected to grow quite as well as it does in the neighbourhood of London, where numbers of trees may be found between 80 and 100 feet high, and a few have been recorded which exceed 100 ft.

Juglans nigra is a native of North America, where it enjoys a wide distribution on the eastern side of the Rockies, extending from Southern Ontario to the southern United States. It varies a good deal in character, and is found from a moderate-sized tree 50 ft. high with a girth of 6 ft. to giant specimens 150 ft.. high and 20 ft. in girth. Two fine examples near London measured a few years ago were in Syon House Park, Brentford, and Marble Hill Park, Twickenham. The former was 116½ ft. high and 13 ft. 7 in. in girth, and the latter 98 ft. high and 14 ft. 3 in. in girth at 5 ft. from the ground, and both trees contained a goodly quantity of clean timber.

A considerable quantity of Black Walnut timber is imported from America, and it finds a ready market It is easily distinguished from ordinary Walnut by its rich dark brown, purplish-brown, or almost black heart-wood with yellowish sapwood. Young trees contain a good deal of sapwood, but in trees 80 years old the proportion of sapwood is small. Timber from trees felled in this country is quite equal in appearance to that of imported wood, and has been very favourably reported on by manufacturers. Black Walnut is a good furniture wood, and is valuable for gunstocks. Finely marked logs are sometimes found amongst straight-grained trees, and such are usually cut into veneer. The tree has one disadvantage when compared with the common Walnut, for although nuts are borne freely and mature, they have very little food value, for the shells are thick and hard and the kernels small; in fact, it is difficult to open the nuts without breaking the kernels.

The cultivation of the Black Walnut in this country should be restricted to the lower elevations, certainly below 500 ft. The best results may be expected by planting it in loamy soil, although good loam is not essential, for well-developed specimens may be seen growing in sandy loam. This Walnut succeeds as a park or hedgerow tree, and could be planted more successfully under woodland conditions than the common Walnut, particularly as there need be no question of planting it for the production of nuts, which would mean considerable branch development. Grown amongst other trees it forms a tall, straight trunk with comparatively small branches, but in the open the head spreads over a considerable area of ground. In planting in woods it would be advisable to so place it that it could be left to mature, nurse trees of other species being so placed that they could be cut away when thinning became necessary. By this system 200 trees of Black Walnut to the acre would be ample. Fertile nuts ripen freely on the older trees. These may be sown in the positions the trees are to occupy; whenever that is not possible the nuts should not be kept in the nursery long, for the sooner seedlings become established in their permanent places the better trees are they likely to make. For parks, avenues, and hedgerows the tree might well be substituted for the too prevalent Elm, and if a little care were exercised in the proper removal of the lower branches and the subsequent dressing of the wounds with an antiseptic, such as coal tar, there would be little danger of the wood becoming coarse or parts of it decayed, which is too often the case with park and hedgerow timber of the present day. *W. D.*

THE APIARY.

By Chloris.

The Queen Bee.—Much mystery surrounds the history of this wonderful female insect. Her functions are well known, but her power in the hive cannot be entirely elucidated. Some beekeepers of considerable note assert that she rules, while others, equally eminent, contend that she does not. This much is certain, that her female republic knows she must be fed according to the needs of the whole community. Instinct tells them that, during the height of the honey flow, she must have a plentiful supply of highly stimulating food in order that she may produce as many eggs as possible, and as the honey flow is reduced in quantity, so the stimulating food must be reduced in quality, consequently there is a gradual decrease in the number of eggs laid, for workers seem to know that the greater the population the greater will be the consumption of food.

The life of a queen bee may be so long as five years, but she is not profitable for such a prolonged period. Before reaching that age, her egg laying powers are nearly exhausted, and then she is deposed and a younger queen takes her place. There seems to be little doubt that her unfertile sisters perform this act. The most wonderful part of the life history is that both worker and queen are produced from eggs precisely alike. This is proved by the fact that queen raisers transfer worker eggs from worker cells to queen cells, or rather the bases of such cells. What then produces the difference so marked and wonderful? The difference arises from the kind of cell and the quality of food supplied by the nurse bees. The queen cell in hives, naturally formed, is found on the edge of the comb as a rule, but sometimes it may be found in the middle in a hole eaten out of the comb, and is somewhat like an acorn and pointing downward. The food is known as "chyle." This is a thick milky white fluid of the consistency of cream, with an acid flavour, and goes thick quickly when exposed to the air. This food is predigested, and is regurgitated from the second or chyle stomach of the nurses, which are young bees fresh from the cells, and all authorities are agreed that this power to produce chyle gradually diminishes after two weeks from leaving the cell.

When the young queen has been out of the cell about a week she leaves the hive if the weather is suitable to meet the drone or male. For this purpose she soars into the air chased by a host of drones. After an eager chase mating takes place while on the wing, and the victor is generally one of the strongest males, because the weak fall out in the rapid flight. After mating has taken place, and this only happens once in the life of the queen, she returns to the hive and is able to produce fertilised eggs from which workers will hatch, or unfertilised from which come drones, and both of these at her own will. The drone which gained the race and fertilised the queen may return, but has to pay the penalty of death, for he has laid down his life in order to perpetuate his race.

When bad weather prevails and a queen is thus prevented from leaving the hive for a period of about six weeks, she will then be incapable of becoming fertilised, and will lay "unfertile" eggs, and be known as a drone breeder.

Swarming.—In a hive where a young queen has been hatched the ruling queen becomes very excited and jealous, being filled with the keenest desire to kill her rival, and this is only prevented by the workers taking watchful care over the reigning queen. She would even rip open queen cells as the time nears for the young queens to emerge, her sex hatred is so strongly developed. However, a summons is given in some mysterious way, and many of her subjects leave the hive, and she joins them, and after flying wildly about for a short time the bees begin to settle on something—often the bough of a tree in the vicinity of the hive. Here they cluster in the form of a bunch of grapes. To hasten the settling process a syringe may be utilised by driving the water into the air, which will descend as a shower of rain. Sometimes the bees are not disposed to settle near the old hive, unless water is used to hasten the decision to settle, and in this case they follow the queen and settle in the place she chooses. In some instances pioneers have been out some days in advance, and have chosen a new home—either an empty hive or a hollow tree or wall.

The bees are very easily handled at swarming time, because they fill themselves with honey before leaving the hive, so that they can build up a new wax city wherever they are put, or have chosen to make a new home. Wax is formed in the body of the bees from honey—20 lbs. of honey being needed to produce one pound of wax. The wax is passed out of the "wax pockets" of the bees—these are six in number, and are on the under side of the abdomen of the worker.

The time of swarming is generally between the hours of 11 a.m. and 4 p.m.—Greenwich time—although during very hot weather it may be as early as 9 a.m. The first swarm is the largest generally, and those that follow at intervals of eight or nine days are termed "casts" and decrease in size; these small swarms are headed by virgin queens. Have everything in readiness for swarming and take care to keep the hive under observation should swarming be anticipated.

The queen is at her best during her second year, and all successful apiarists take care to have their colonies headed by second year queens only, and these selected from young and proved queens of their own raising in the previous year.

NOTES FROM IRELAND.

Allotment holders around the Milesian Metropolis show no lack of enthusiasm, and their only anxiety at the moment seems that of retaining what they are given to understand is cnly to be regarded as temporary tenure.

It has been hard toil in many instances to convert the most uncongenial of soil and unfavourable sites into what has proved pleasant and profitable work. Here, as elsewhere, plot work has not only proved of value in our political economy, but looks like going a long way towards settling the Irish question. The stimulus given to gardening generally has been very great and the majority of amateur growers may be expected to continue to garden after peace is signed and in other directions than vegetable cultivation.

Widely and well known as was the late Mr. T. Smith, of Newry, wherever the good things of hardy plant life were appreciated, it was perhaps here, in the land of his adoption, he was best known, and by most, sooner or later, respected, for even those who were apt to resent his somewhat dogmatically expressed opinions eventually recognised that his prescient grasp of possibilities invariably proved him right. "Smith o' Newry" was a name to conjure with in his own particular sphere of the great gardening world, while his unpretentious but comprehensive published plant lists were the *vade mecum*, as Daisy Hill Nursery became the Mecca of the many interested in this most fascinating phase of floriculture. Some of the most enjoyable hours the writer of these notes has spent were occasional ones in his company, and the late Mr. F. W. Burbidge in the Botanic Gardens of Trinity College, Dublin.

Less known in the gardening world, but honoured and respected by those privileged to come in touch with him and his beloved alpines, was the late W. Seymour Bird, K.C., some time County Court Judge of Kerry, who died after a lingering illness at his residence, Churchtown House, Dundrum, Dublin, on the 1st inst. He had probably the best private collection of alpines and rock garden plants in the county.

A specimen flowering spike, one of a colony of a dozen similar examples, of Saxifraga longifolia, which he showed at the Council meeting of the Royal Horticultural Society of Ireland, June 13, 1913, was a perfect pyramid eighteen inches high and twenty-seven inches in circumference at the base, with every flower perfectly fresh from top to bottom. The old-fashioned garden which "the Judge" loved was the happy home of many choice and interesting plants. *K. Dublin.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Variability in Plants (pages 251, 285).—When working in the Manchester University greenhouses a Fuchsia plant developed a shoot bearing three leaves at each node. I inserted a cutting of it, but as it is 15 months since I left Manchester, I do not know if the plant still exists. or if it continued its abnormality. *M. E. Edmonds.*

—— The "freakishness" of growth noted by your correspondent in seedling Fuchsias is not uncommon in F. Riccartonii and F. pumila, when they are treated as herbaceous plants. The leaf arrangement of the young shoots is variable, often in 3-4 leaved simultaneous whorls; often irregular, lateral shoots bear the normal, opposite leaves. Of seventy-seven young plants of F. Riccartonii I raised from cuttings, forty-two have been taken from such abnormal growths and have the three-leaved whorl arrangement; one plant only having the four-leaved whorls. The value of this in the number of shoots produced at the first "break" is apparent. A low percentage of tricotyledonous seedlings are produced by Chenopodium album (noted in 1912). Another search gave me five seedlings, each with a three-leaved whorl of ordinary leaves above the tri-cotyledons; the leaf arrangement of this plant is also very variable. Some conifers naturally have 3-5 cotyledons. Departures from the normal appear to be of little biological or horticultural value unless they are fixed. *P. Sargeant, Pirbright.*

Chelsea Floral Fete.—So great has been the response to the appeal for exhibits of flowers for the Floral Fête of the Royal Horticultural Society's War Relief Fund, at the Chelsea Hospital Gardens, on June 24, 25, and 26 next. that the Council of the Society has decided to appoint a deputation of its members to make awards of gold and silver medals and diplomas. The Wigan Cup for the best group of Roses, one of the chief awards in the gift of the Society, will also be in competition. One outstanding feature of the Fête is that the National Sweet Pea Society, the British Carnation Society, and the National Rose Society will be largely represented. Entries should be made to Mr. W. E. Bisset, at the offices of the War Relief Fund, 17, Victoria Street, S.W., on or before June 17. *Herbert Grover, Press Representative.*

SOCIETIES.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

The monthly meeting of this Society was held in the R.H.S. Hall, on Monday, June 2, Mr. Chas. H. Curtis presiding. One new member was elected. The Army Form of one member killed in action was received, and the sum of £10 15s. 11d. was passed for payment to his nominee. The sick pay for the month on the ordinary side amounted to £62 4s. 3d., on the State section £26 7s. 6d., and maternity claims to £4 10s.

BRITISH GARDENERS' ASSOCIATION.

The annual general Council meeting of the British Gardeners' Association was held at Birmingham on Whit Monday. Delegates representing over 5,000 members were present. It was decided to press for a 44-hour working week for horticultural workers and for a minimum wage of £3 per week for adult horticultural workers. Mr. R. Greenfield, Leamington Spa, was elected President for the ensuing year. It was reported that over 2,000 members had been enrolled in a month, and that a working agreement had been arrived at with the National Agricultural and Rural Workers' Union.

The Executive was elected as follows:—Messrs. J. R. Groundwell (Leeds), T. H. Candler (Bournville), F. J. Longmire (Putney), Alex. Duncan (Dundee), V. H. Lucas (Sheffield), J. Young (Chesnunt), A. G. Cann (Chudleigh), and G. Hockney (Reading). Mr. Thos. Winter, (Marylebone), was re-elected Treasurer, and Mr. C. Fletcher (Tottenham), was elected Vice-President.

THE WAKEFIELD AND NORTHERN TULIP.

May 26, 27.—The annual show of the above Society was held in the Club Room of the Brunswick Hotel, Wakefield, on Monday and Tuesday, the 26th and 27th ult. There was a fine display of blooms—about 500 being staged by 14 entrants. Mr. J. W. Bentley, of Stakehill, near Manchester, showed some fine examples of the florist's Tulip, his Flamed Paxton, staged in the class for "pairs," being the finest flower seen at Wakefield for several years. Indeed, all his rectified blooms, which were grown at Llandudno, were big and well marked, the density of colour being remarkable. Mr. Needham, of Hale, Cheshire, followed closely, and he excelled in the Breeder classes. Mr. Needham has officiated as judge at this show for a number of years, and did so again this season with Mr. Bentley, Ald. Wood (of Middleton), and Messrs. J. Netherwood, T. Spurr and W. Garside (of Wakefield).

The prizes were awarded as follows:—Six Rectified Tulips (Open Class)—1st, Mr. Bentley, with Samuel Barlow (Premier flamed), Wm. Annibal, Talisman. Bessie (premier feathered), Mabel and Mrs. Akins. 2nd. Mr. Needham, with Saml. Barlow, Cavendish. Talisman. Bessie, Annie M'Gregor, and Mrs. Collier. 3rd. Mr. H. Gill, with Paxton, William Wilson. Bertha, Stockport, Mabel and Modesty.

In the Local Class for Six Rectified Tulips, Mr. H. Gill was placed 1st; 2nd, Mr. J. Hardwick; 3rd, Mr. W. Blakey.

In the Open Class for Six Breeders Mr. Needham excelled with the varieties S. Barlow, A. Lloyd, Talisman, Columbine, Rose Hill, and Hall's Seedling. 2nd, Mr. Bentley, with S. Barlow, A. Lloyd, Talisman, Seedling, Mabel and Rose Hill. 3rd, Mr. R. Robinson.

In the Local Class for Six Breeders, Mr. R. Robinson was awarded the 1st Prize. 2nd, H. Gill.

Mr. Needham also excelled in the class for Three Breeders, with the varieties A. Lloyd (premier), Julietta, and Columbine. 2nd, Mr. Robinson, with Goldfinder, Bridesmaid, and Rose Hill. 3rd, Mr. Bentley.

In the class for "Pairs," one feathered and one flamed variety, Mr. Bentley showed best, with Paxton flamed, Bessie feathered. 2nd, Mr. Needham, with Hardy flamed, Mrs. Collier feathered. 3rd, Mr. R. Robinson.

CROPS AND STOCK ON THE HOME FARM.

State Aid for Agriculture and Horticulture.

It is pleasing to know that the Government proposes to expend a considerable sum of money on the advancement of both agriculture and horticulture.

It is to be hoped that assistance will be given to the advancement of the practical as well as the scientific aspect of the question. In each county there should be an experimental farm which farmers could turn to when requiring aid on any subject, such as enlightenment on diseases and type of manures to apply for certain soils and crops. The analysis of soils might also be undertaken, for it would be a boon to the farmer if he knew what constituent his soil lacked, and he would also know how to arrange his cropping to the best advantage. The experimental farm should be situated where it would best serve the interests of each individual county. The committee of management should be practical men who know from experience the kind of information required. Men with no first-hand knowledge of agriculture are useless on such committees, and the work should include investigation of diseases of crops and animals. The superintendent of such a farm should have a practical knowledge of farming and be able to reply to questions that are troubling growers about their crops and diseases.

In the horticultural section, the commercial side needs most aid. The selection and retention of the best varieties and types of such crops as Strawberries, Currants, Raspberries, Peas, Beans and Cabbages would form subjects for profitable investigation. One of the greatest of all problems that confronts the horticultural committee is to provide a direct outlet for the produce when grown, whereby the dwellers in towns may have the advantage of the best vegetables and fruit at reasonable prices. It is a common occurrence in rural districts to see acres of such crops as Cabbage and Brussels Sprouts which cannot profitably be marketed under the existing conditions owing to a glut of these particular crops at certain seasons.

What is needed is a system of motor transport by State aid to convey such crops into the towns. Such a step would tend to the increased production of vegetables.

These are some few of the problems such committees should set themselves to solve, and thus be a channel of useful information to those who are commercially engaged and at the same time confer a benefit on town dwellers.

Stimulating Cereal Crops.

The long continued drought is having its effect on the growth of Oats where the land is not in good heart, and especially where sowing was retarded, owing to various causes. The plant is not vigorous, nor is it of good colour, the flag being pale green. Where the soil varies in character in the same field a judicious application of sulphate of ammonia at the rate of 1cwt. per acre will give a fillip to growth, improving the straw and the grain in bulk and quality.

Swedes.

Among root crops the Swede is perhaps the most important of all to the sheep farmer, and valuable also to the cow-keeper. After Turnips in August, September and October, Swedes bridge over the period, until Mangolds are ready for use in December, January and onwards. To the sheep farmer Swedes are a boon from January until the middle of May, as they keep better than Turnips and have greater feeding value. For a flock of 400 ewes and lambs, thirty acres of Swedes is none too much. I sow Rape with the Swedes, as I find lambs appreciate the extra green food

which Rape produces. This plant is hardier, too, than the Swede greens. With a five coulter drill I sow one row of Rape; if this is from the outside coulter the two rows of Rape come together, which the shepherds approve, as it suits their folding better, and it is wise to accommodate the shepherds in their method of working.

If the land has previously carried a straw crop, is free from weeds, was autumn ploughed and any previous root crop did not show any tendency to finger-and-toe disease, the ground, with the application of 4 cwt. 30 per cent. superphosphate, will grow a full crop of Swedes. If there has been the slightest sign of the disease noted, apply 6 cwt. of basic slag per acre in the place of the superphosphate, as previous dressings of the former may have "soured" the land.

In southern counties where Swedes are largely grown for sheep, the middle of June is early enough to sow the seed. As a rule, if the sowing is made earlier and dry weather sets in during July, the Swedes suffer much from mildew, which is fatal to a successful yield of clean, full-sized roots that will keep sound until the middle of May.

Ploughing the land repeatedly before sowing the seed is important. In dry weather it is a good plan to sow the same day as ploughing is done to ensure a quick germination of the seed, which is all important, as the Swede plant should make free, quick growth from the commencement. The Turnip Fly is very troublesome to Swedes, especially if the growth of the plant is slow owing to retarded germination.

It is wise to roll the land in front of the drill to retain the soil moisture, especially if the surface is rough. The seed, too, will be sown at a more even depth as the coulters run more uniformly in preparing the drills for the seed.

Directly the plants in the rows can be seen across the field, stirring the soil about them with the horse-hoe, or even harrows drawn crosswise over the rows before thinning is done will hasten growth. Two pounds of seed per acre is ample and one pound of Rape seed. Dunn's Defiance and Toogood's Purple Top are excellent varieties for general use, although there are probably other sorts that will give a heavier weight per acre. *E. Molyneux.*

Destruction of Charlock.

Charlock (Wild Mustard, Kedlocks) appears to be plentiful this year. In view of the immense number of seeds produced by a single plant and the extraordinary vitality of the seed (which may remain buried in the ground for years without losing its germinating power), it is most important that seeding should be checked as far as possible. If only small numbers of plants are found they may be pulled by hand, but in a badly infested field spraying is the only remedy. Charlock is more easily killed when in full flower than at any other stage. The corn in which it is growing will be damaged a little, but will soon recover. In the eastern counties it is usual to apply 40 or 50 gallons per acre of a 3 per cent. solution of copper sulphate (*i.e.*, 15lb. copper sulphate to 50 gallons of water per acre), but in western districts a 4 per cent. (*i.e.*, 20lbs. to 50 gallons per acre), or even a 5 per cent. solution may be employed.

GARDENING APPOINTMENTS.

Mr. R. P. Scriven, late of R.G.A. and previously Gardener at Brandear House, Alresford, Hampshire, as Gardener to Mrs. Faith, Weyhill Lodge, Andover, Hampshire.

Mr. R. J. Tanner, previous to the war Gardener to the Rt. Hon. Lady Sydenham, The Priory, Lamberhurst, near Tunbridge Wells, Kent, as Gardener to H. Bull, Esq., Wells Bridge House, Ascot, Berkshire.

CATALOGUES RECEIVED.

The Newman-Bates Chemical Co., Dunster House, Mark Lane, London, E.C.3.—Anti-Blightol for Potatos.

Dickson & Robinson, Cathedral Street, Manchester—Bulbs for early forcing.

THE WEATHER.

WEATHER IN SCOTLAND.

May was a relatively dry month, the total rainfall being but 0.97 inch distributed over nine days, with a greatest fall of 0.39 inch on the 6th. There was a shower of hail on the 3rd, and a sharp thunderstorm on the afternoon of the 11th. The number of hours of sunshine was well over the average of the past four years, being 194.5 hours, a daily average of 6.3 hours, and a percentage of 38.6. There were four sunless days. With a mean of 30.09 inches the barometer varied between a highest of 30.34 inches on the 7th and a lowest of 29.365 inches on the 2nd. Temperature varied considerably, the highest maximum being 73° on the 28th, and the lowest minimum being 29° on the 2nd, thus giving an absolute range for the month of 44°. The lowest maximum was 45° on the 6th and 7th, and the highest minimum 48° on the 13th, 28th and 29th. The mean maximum was 58°, and the mean minimum 41°, with a mean temperature of 48.5°, and a mean range of 17°. On three nights the temperature fell below 32°. On the grass the mean minimum was 37°, with a lowest of 20° on the 2nd; there were four nights of ground frost. For the dry bulb thermometer the mean was 51.9°, and for the wet bulb 48.3°, showing a relative humidity of 74 per cent. At one foot deep the soil temperature, with some fluctuations, rose from 45° to 57°. Light winds prevailed during the month, mostly easterly and southerly. *James Malloch, Director of Studies, Training College Gardens, Kirkton of Mains, near Dundee.*

ANSWERS TO CORRESPONDENTS.

Agricultural Wages: *G. W. B. G.* The new rates of wages fixed by the Agricultural Wages Board do not apply to employees in private gardens and pleasure grounds. You can obtain particulars of the Order on application to the Agricultural Wages Board, 80, Pall Mall, London, S.W.1.

Red Spider on Carnations: *L. L.* The simplest method of clearing indoor plants of red spider is to syringe them with clear water. The pest is always troublesome where much fire heat causes a dry, hot atmosphere. In cases of bad attacks, the insects may be destroyed by the use of sulphur, and when the hot water system is employed the sulphur may be painted on the pipes. At this season of the year flowers of sulphur may be mixed with water and the mixture syringed on the foliage, taking care that the under surfaces of the leaves are treated as well as the upper ones. Spraying with clear soot-water is also a good preventive of attacks of red spider.

Character of Soil: *J. S. G.* The ground you describe would not be suitable for Rhododendrons or any of the Ericaceae, but if properly treated it should grow good Roses. Nearly all the commoner flowering shrubs, such as Berberis, Brooms in variety, Spiraeas, Deutzias, Weigelas, etc., will be found to do well in such soil. Deciduous trees, such as Oak, Elm, Ash, Horse-Chestnut, Poplar, Sycamore, and Norway Maple can be planted, but not Birch, Lime, or Beech. Of evergreen trees and shrubs, Holly, Yew, Box, common and Chinese Junipers, Lawson's Cypress, Austrian and Corsican Pines, Cedars, Deodara, and common Spruce are the most useful, but a rough idea of the most suitable trees can be obtained by noticing those which are growing most freely in the locality.

Loss of Peach and Nectarine Leaves: *C. R.* Your description of the leaves which fall from your Peach and Nectarine trees suggests an attack of red spider. This pest is not red in its young state, and is very minute. Leaves should have been sent for examination. Examine through a magnifying glass some of the leaves which have not yet fallen, and if the mites or their eggs are discovered apply one of the advertised remedies for red spider according to the directions given with it. This will also check the mealy bug until the autumn, when stronger applications may be made. Remove the suckers as they appear, and in the autumn lay bare those roots which produce suckers, and cut them away.

Mangetout Peas (French Sugar Peas): *T.C.* The time for picking depends somewhat upon the actual variety. The pods are generally ready for the table when the Peas are about half to two-thirds developed. If too young, the result is rather mushy and the flavour is not fully developed; on the other hand, the Peas should not be hard or bullety. A variety such as P. mangetout à très grande cosse, in which the pods "balloon" up, should be picked just before this occurs. After boiling, if "tossed" in the bacon fat, they make an addition to the ordinary breakfast rasher, as in fact, do shelled out Peas or Beans.

Names of Plants: *Correspondent.* You send more than twelve specimens, which is contrary to our rules. Nos. 1, 4, and 14, Pinus tuberculata; 2 and 6. Pinus austriaca; 3, Cedrus Deodara; 5, Pseudotsuga Douglasii var. glauca; 7, Pinus insignis; 8. Juniperus excelsa var.; 9, Pinus excelsa; 10. Cupressus sempervirens; 11, C. macrocarpa; 12, Berberis vulgaris; 13, Thuya dolabrata; 14, Abies Pinsapo; 15, Cupressus nootkatensis; 16, Pseudotsuga Douglasii; 17, Picea excelsa var.; 18 and 19, Cupressus Lawsoniana vars.; 20, Pinus Laricio; 20, Tsuga canadensis (two specimens were numbered 20); 21, Pinus ponderosa; 22 and 23, Picea excelsa. *A. N.* (1) Tradescantia virginica; (2) Exochorda Giraldii; (3) Nepeta Mussinii; (4) Hemerocallis flava; (5) Veronica gentianoides; (6) Viburnum rhytidophyllum; (7) Trillium sessiliflorum; (8) Olearia stellulata; (9) Tamarix aestivalis; (10) Calycanthus floridus; (11) Lonicera Maackii; (12) Halesia tetraptera. *H. T.* (1) Thuya plicata; (2) Ulmus montana; (3) Acer monspessulanum; (4) Asphodeline lutea; (5) Staphylea colchica; (6) Exochorda Giraldii. *P. G. D.* 1, Rhus Toxicodendron (Poison Ivy, a very dangerous plant); 2, Kerria japonica flore plena; 3, Philadelphus coronarius; 4, Aesculus parviflora; 5, Stachys lanata; 6, Helianthemum vulgare var. cupreum; 7, Heuchera sanguinea var.; 8, Phlomis fruticosa; 9, Diervilla "Eva Rathke"; 10, Spiraea japonica; 11, S. Van Houttii; 12, Choisya ternata.

Rose Beetle on Apple Blossom: *H. E. M.* The handsome beetle sent is an example of the Rose Beetle or Golden Rose Chafer (Cetonia aurata). This beetle sometimes eats away the stamens of Strawberry and other rosaceous blooms, and of Turnips. In the grub state it feeds on the roots of Strawberries and grasses. The beetles should be caught and destroyed; they are sluggish and easily caught with a net. The grubs may remain in the ground for two or three years; therefore the soil should be freely worked during the winter in order to expose the grubs to insectivorous birds.

Scutellaria baicalensis var. coelestina.—*Enquirer.* This is a perennial plant of erect habit, forming a bushy plant from 1 ft. to 2 ft. high. The sessile leaves are narrow and entire, while the blue flowers, about one inch long, are produced in long racemes in August. The plant is quite hardy and will grow in ordinary soil in the herbaceous border. It may be increased by means of seeds, which are produced freely, or the plants may be divided in the autumn or early spring. It is a native of Siberia, and as also known by the name of Scutellaria macrantha.

Wire Worm in Turf: *E. L.* You would be very unwise to use old turf that is infested with wireworms for use as potting soil for Carnations. Wireworm is a very difficult pest to eradicate from soil, but if you can obtain gas lime, that would probably prove effective, placing the gas-lime in layers between the turves as the stack of loam is built. It would not be safe to use such compost until it had been stored for a season, as gas-lime is harmful to plant life until after it has lost its corrosive action by exposure to the atmosphere.

MARKETS.

COVENT GARDEN, June 11.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

Remarks.—The chief flowers on sale last week were white and coloured Pyrethrums, Sweet Peas, white Daisies, white Pinks Mrs. Sinkins. and Paeonies, of which there was a goodly supply. Carnations were only moderately supplied, and best quality blooms sold for 9s. per dozen. Good Roses were also very scarce, and many orders for white blooms could not be executed. A few bunches of white Gladiolus sold freely at 5s. to 6s. per bunch. Richardias (Arums), although fairly plentiful, were only of medium quality, but those sent were soon sold. A few boxes of double white Narcissus arrived from Scotland in fine condition. The supplies this morning were more plentiful, and prices are again normal. Pyrethrums appear to be finishing, owing to the dry weather. White Pinks are sufficient for the demand; there are also abundant supplies of Paeonies and Sweet Peas. Roses grown under glass are still offered for sale: best red and white blooms are still very scarce. Mme. Abel Chatenay is the best variety. The newest subject is Gladiolus Brenchleyensis. Lilium longiflorum is offered at lower prices. The blooms are most welcome by florists, having been absent from the market for several weeks past.

Remarks.—Supplies of Grapes (black and Muscats) are increasing, and Nectarines and Peaches are fairly plentiful. There are some good Melons on offer, and Figs continue in fair supply. Oranges, Californian Sweets or New Valencias, are now on offer. A consignment of South African Pears and Grapes has arrived in the markets, the Pears consisting of the varieties Winter Nelis and Glou Morceau. Cherries and Plums (French) are on offer, and English Gooseberries are more plentiful. Strawberries are now arriving from Southampton, the West of England and Kent. The forced berries are coming to an end. Asparagus crops are finishing, and Cauliflowers are limited in supply. Outdoor Early Peas and Broad Beans are on offer, and fair supplies of forced Peas and Beans (dwarf)) are arriving daily. Supplies of Tomatos are increasing, and English and Dutch Cucumbers are very plentiful. New Potatos are arriving in sufficient quantities, and Mushrooms show an increase in supply.

GROW MORE FERNS!!

EVERYONE can grow Ferns successfully in this country, even in conditions which are totally unsuitable for other plants. If your garden is shaded with trees, and you find it difficult to get anything to flourish,

TRY FERNS!

You can learn all about their cultivation in the little book

FERNS AND FERN CULTURE,

which is to be obtained (price 1/3 post free) from—

London, W.C.2.

THE GARDENERS' CHRONICLE.

The Gardeners' Chronicle is the only gardening paper with nearly eighty years of history behind it. It was founded in the dawn of what is commonly termed the scientific age. It has seen the rise and development of the railway, and its partial supersession by motor road traffic; the discovery of the power of electricity, and its application to a bewildering multiplicity of every-day affairs; the economic emancipation of women, and their entry into industrial life; and, last of all, the discovery of the flying machine—so long believed to be impossible. **The Gardeners' Chronicle** has not remained static through all these marvellous changes. It has grown, developed, expanded. It has remained throughout its whole career completely in sympathy with its readers. It has advanced with them, explored with them the realms of experiment, examined with them in a spirit of intelligent sympathy every new theory of botanic or horticultural science, provided a medium whereby they have been enabled to communicate with each other and make their discoveries known. It is revered for its great age, yet respected for its modernity; it has the experience of years and the elasticity and progressiveness of youth. Through the storm and stress of the past five years it has stood unmoved, and it looks forward in full confidence to the enjoyment of the ampler scope and increased opportunities which the termination of the war will bring.

BACK TO PEACE CONDITIONS.

ALTHOUGH there is not now an acute shortage of paper, still there are few papers which have returned to their pre-war size. For this reason advertising space has to be carefully allocated, and those ordering "special positions" will do well to order them in plenty of time. Advertising ALONE will not build up a business, but advertising, combined with good quality and courteous service, will bring the best results.

SEED TRADE, etc.—Position required as Traveller or Manager; life experience.—Apply BASHAM, Station Road, Bedford.

THE PLANTER'S NOTE BOOK.

By the late ROBERT WOODWARD, of Arley Castle.

This book is indispensable to all foresters, or those whose work includes the planting of trees. It is absolutely necessary, if such work is to be intelligently done, that a complete record be kept of the trees planted, the species and varieties, the exact positions in which they are placed, and their growth and development. For this purpose the

PLANTER'S NOTE BOOK

is admirably fitted. The price is so moderate—only **1/-**, or **1/2** post free—that the plea of expense cannot possibly be urged.

Send for your copy **now** to

Work with ease but—
Use the "ENTERPRISE" CLIP BRACKET.
This bracket is introduced for the purpose of training Vines, Creepers, Tomato Plants, Plants and Cuttings of all varieties.

It does away with the old way of tying with string—often detrimental to the plant. All it is necessary to do is: Place clip on stick at the desired spot and place plant in clip—moving as plant grows.
Made in various sizes for different sized sticks.
Nurserymen, Gardeners, and Amateurs will find this clip bracket most useful and a labour-saving device.
It combines work with ease and comfort.
Per 12/- Gross.
Carriage paid on all orders of £2 to any part of U.K.
Smaller lots at 1/- per dozen and postage 3d. per dozen extra.
SPECIAL TERMS TO AGENTS.
If unable to purchase locally, write to manufacturer mentioning seedsman's or ironmonger's name.
Sole Manufacturer and Patentee: G. H. TONKS, 8, Dartmouth Square, WEST BROMWICH.

Gardeners' Chronicle Horticultural Directory.

There are still a few copies of the *Horticultural Directory* on sale, but the 1919 edition is now nearly exhausted, and those who wish for a copy should write at once.

Gardeners who have surplus fruit for which they desire to find a market should consult the list of SALESMEN in all the largest towns of the United Kingdom, which is to be found on page 275 *et seq.*

Demobilised men who desire information of the whereabouts of their gardener friends will find the list of gardeners' names and addresses invaluable.

Apply, enclosing 2/- for each copy required, to:—

MR. REGINALD FARRER'S SECOND EXPLORATION IN ASIA.

I. THE BURMA-CHINESE ALPS.

On the Road.

ONCE more I am off on track for the hills. But in an unknown land among unknown peoples and conditions, and with no Purdom and no Mafu to show me the ropes and protect my ignorance. However, let us hope good will come of it: and now for the start. This time, though, my whereabout is not hard to tell: but few maps will give its details, and in some of its parts there are no people at all to supply local names, even if I could spell them if they did, or you pronounce them. One other caution, too: undeterred by cold-blooded criticism, I intend to continue describing my plants as I myself see them. Nothing more surprises and pains me, indeed, than to have some plant-portrait of mine alluded to as being "in somewhat enthusiastic terms" when, to my own eyes, its colours have only erred in their rigid, frigid accuracy. At the same time I have discovered that a species in cultivation does not always bear the same brilliancy of hue as it affects in the wild hills: so that those who have read my impressions of it as it was, may fairly think they have occasion to blaspheme when they see it as it is, in their gardens, a pallid weed. A sad case in point is my purple Salvia F. 169. No one who sees its shrunken anaemic blooms in a border could easily help thinking me untruthful for describing its imperial purple glory in the Tibetan hayfields. Yet so it was. Therefore I must here enter a preliminary warning against being too certain that a plant in exile will necessarily be as beautiful as the same plant at home. But it will be the plants at home that I shall be describing; and only, and exactly, as they are at home.

Myitkina is the rail-head and jumping-off place from Upper Burma into the Alps that border on China, a region sparsely and wildly inhabited, and only very recently taken over by Great Britain, in an easy sway that leaves the country pretty well alone, content so long as China does not try to occupy it. Myitkina itself is still tropical—a pleasant settlement, lying along beneath the embankment of the placid Irrawaddy. But cool breezes descend on it from the not far-distant snows, with the result that it gives an impression of a great, homely, green park, with squatting bungalows embowered in verdure and gay with familiar garden-flowers. Never, for instance, have I seen Hollyhocks so brilliant in flower, so neat and refined in habit. But across the Irrawaddy the trail finds itself at once in the wild jungle where tigers prowl; and for a week or so pursues its course through the heavy opulence of that uncharted tangle. At first the bigger trees are curtained with Petrea volubilis, now gone out of bloom, but with the velvety plum-colour of its innumerable developed calyces, producing as beautiful an effect as when with masses of giant Honeysuckle-heads, not a bit more brilliant than its meek diminutive at home; and an Actinidia with little orange trumpets falls in curtains, with bunches of leaf-bracts so vividly white that at first sight one thinks one has come on some snowy multiflora Rose. But the great beauty of these parts is the Bauhinia just now. This forms a graceful tree, so unanimously flowered that on the high slopes of the jungle it stands out like a blooming Cherry-tree on some mountain-side in a Chinese picture. It occupies, too, a very rigidly defined zone, between two and three thousand feet. From such an altitude I dare not hope it will prove hardy, but it shall go badly with me but it must have its chance, for it is a most lovely thing, intensely fragrant like a hyacinth-scented Cattleya, and not unlike a reversed Cattleya,

[*Photograph by H. M. Cox.*

FIG. 149.—THE HOME OF RHODODENDRON INDICUM ON THE NGAW CHANG.

they are lavender-blue, and contrast so finely with the violet-velvet of its flower-stars. (My names must, in nearly all cases, of course be taken as merely tentative).

In due course the Nmai Hka is reached, the great eastern branch of the Irrawaddy, that comes down from the mountains bordering on Tibet. For some days the road continues up and down, and in and out above it through the jungle, circumnavigating the countless spurs and ravines that descend to the river; and occasionally, on lofty suspension-bridges, crossing the tributary torrents that now, at the end of March, still sleep quietly in the depths of their profound gorges, but in the rains of June awake to ravening furies. Though still chiefly tropical, with various Palms and an unbelievable abundance of Banana, the jungle now has a few familiar things. Buddleia asiatica is the most welcome, Lonicera Hildebrandtii drapes tall trees too, in its great flowers (see fig. 151) of tenderest pale shell-pink, with a crimson flame on their upper segment. In the river shingles Rosa bracteata is now opening among the boulders; and all the Scottish-looking lengths of dark granite bluffs and reefs and islets that make the huge Nmai Hka so like a magnified version of some Scotch stream are now aflare with the furious scarlet of Rhododendron indicum, smeared like an interminable bloodstain, just above high-water mark, all along either bank of the river.

But at last the road, long since dwindled to a mule-track, turns away from the Nmai Hka, eastward, and sets itself to mounting a high pass or two, before sinking again into the bed of the Ngaw Chang, a notable tributary of the Nmai Hka, drawing its waters from the Border Alps, now so close that one can see some of their lower ranges dimly through the haze of the many jungle-fires that are clearing strips of

hill-flank for planting. But the passes, though ascending to 7,500 ft., are still in the tropics, though deep and dense now, with the heavy rainfall. Huge-fronded Palms without trunks lurk in the darkest chines, whose steepness is such that their trees have to develop bare boles of gigantic stature; and on tall, stately trunks Tree-ferns expand their sumptuous fronds. By the mossy alpine looking pathside, emerging clots of pink Begonia-blossoms mimic early Hellebores coming up, and the rich blue Gloxinia-blooms of Gesnera make a telling contrast; while on one stretch of the ascent occurred a remarkable Campanulad of graceful arching habit, like a Solomon's Seal, swinging from each axil-meeting a single fruit, large as a round Black Hamburgh Grape, of porcelain-like surface, and rich blue-violet colour. But, though we were now well up in the alpine levels, and above the bare austere magnificence of Mont Cenis, no one could have found a sign of this, in the profound green stillness of that primeval tropic forest, with Magnolias making a carpet of their creamy petals.

Nor were there as yet even any Rhododendrons, until we turned a corner, and there came into view a tall tree with a gaunt, bare bole like a Scotch Fir, but of brilliant lacquered-looking red, carrying a domed crown of solid soft pink*. As this trunk, a foot through and some fifty feet high, offered no foothold, it was necessary to shoot down blossoms of this, our first Rhododendron (for to the gardener, R. indicum is always Azalea), since one never dares pass by a first specimen, for fear of its also being the last. This Rhododendron, however, proves general at about 7,500ft. in the range even ascending to Hpimaw, so that I have fair hopes that it may be hardy, though of course its extreme precocity of blossom may spoil its usefulness in England, unless it can be taught to adopt lazier habits. These blossoms (see Fig. 150) though carried in their best abundance on a naked-trunked tree, are true "Azaleas" in style, rather than Rhododendrons—of a very pale pink, darkening slightly to the edge with a yellowish flush in the throat, and the darker rose of the tube showing through, thus suggesting a deep "eye" to the flower, which is large and of the most ravishing fragrance. Small wonder if we had, then, but scant attention for another Rhododendron that was also there—a true Rhododendron, though out of flower, that may very likely turn out to be R. Kyawi. And of other flowering trees in this high forest there were also a beautiful Cherry of bright pink, and a pure white Styrax that scented the air. The Cherry occurred occasionally, and the Styrax more often as we drew nearer the big mountains. But both of these were trees of such height and nudity that again the shot-gun was our only resource. The echoes clattered, the birds scattered, and a few petals or a torn shoot were all that came fluttering slowly down in the quiet air. *Reginald Farrer.*

FIG. 150.—RHODODENDRON SP. FARRER'S No. 801.

LETTERS FROM SOLDIER GARDENERS.

PALESTINE.

THE first impression a visitor receives of Palestine is scarcely of the best, for the country throughout is lacking in engaging landscape. To describe it as beautiful would convey an inaccurate notion of the features which constitute beauty of scenery. For miles one may journey and not see a sign of life or habitation. Yet it is remarkable how many ruins are met with on the numerous hills, such as fragments of ancient walls, foundations of buildings, and piles of stones, all of which indicate a past habitation and confirm the age which belongs to Palestine. One is inclined to ask if these stony, arid hills, deserted valleys and large stretches of plain are cultivable, yet the answer is decidedly in the affirmative. The country at one time supported a much larger population than now, and could be made independent of food from other countries now that misrule is removed. Steps should be taken speedily to make the plains and valleys seas of grain, which would alleviate the poverty that is evident at the present time and cause the country to be more self-supporting in the near future. At the present time there are remains of terraces that were formed in a past age to hold up the soil on the steep declivities, where, doubtless, the Vine and Fig once flourished. Some of these are still in a good state of preservation, but in many cases the supporting walls are neglected and in ruins.

The country for the most part is bare of forest timber of any commercial value. The humble stature of the Olive trees clothing the hills helps to accentuate, from the appearance of the foliage of these trees, the grey hue peculiar to many parts of the country. There are a few good plantations of Eucalypti, chiefly in the proximity of Jewish colonies, and these trees will, I presume, be planted more largely in future, for they are well suited to the climate.

The fortune of war has made considerable travel possible to me. Few Date Palms were seen, and their rarity over wide tracts of country attracted my attention. Here and there isolated trees of Phoenix occur, but not of the noble dimensions which distinguish them in the Sinai Peninsula. Leaving Palestine proper, and passing into the Anti-Lebanons, one sees pleasant landscape. The villages have extensive orchards of Quince, Apricot, Apple, Plum, and Walnut, with vineyards, encircled or separated by hedges of Hawthorn and Buckthorn freely mixed with Dog Rose and Blackberry. Land cropped extensively with vegetables, chiefly Potatos, Marrows, Turnips, Cabbages, Cauliflowers, Tomatos, Aubergines, Leeks, Onions, Spinach and Radishes, gives the district a distinct European appearance.

Timber trees assume the same proportions as in Europe, and a number of trees familiar in Great Britain may be seen. The climate is much cooler in this zone of Syria than in Palestine, and it is not so arid, as streams and springs abound. Oak trees are met with, but the specimens I saw were very stunted and gnarled, including those of Quercus Ilex. Poplars and Willows appear to be abundant, but Maples and Planes were not so numerous. I did not see any Cedars, but Pines were growing in fair quantity. A few trees of Ash were seen, but I think they may possibly be in greater quantities in other parts of the country. *F. Gooch, Hants Battery, R.H.A., E.E.F.*

PLANT NOTES.

ELAEOCARPUS CYANEUS.

ACCORDING to the *Dictionary of Gardening*, this charming greenhouse plant was introduced from Australia in 1803, where it is known as the pink-flowered, Blue Olive-berry tree, and is a native of Victoria, New South Wales, Queensland and Tasmania. It belongs to the Lime family (Tiliaceae), and, as is the case with some other species, the flowers are remarkably showy. The plant is said to reach a height of 15 feet in its native country, but it will flower freely when much smaller than that; indeed, young plants that have been propagated from cuttings will bloom when but a few inches high. This Elaeocarpus will, if the main shoot is secured to an upright stick, assume a more or less pyramidal form, while the branches will often be disposed in a horizontal manner, or nearly so. This allows the drooping, somewhat bell-shaped flowers to be seen to considerable advantage. They are pure white, with the edges of the petals beautifully fringed. This last feature is so pronounced as to cause a well flowered example to be universally admired. Messrs. James Veitch and Sons showed at the summer meeting of the Royal Horticultural Society on June 4, 1912, a delightful group of this Elaeocarpus, and the plant was awarded a First-class Certificate. While the specific name of cyaneus is regarded as the correct one, the species is sometimes met with in cultivation as E. reticulatus, a name which refers to the veining of the undersides of the oblong leaves. The name of cyaneus is derived from the blue colour of the Cherry-like fruits. The cultural requirements of this Elaeocarpus are simple. It will thrive in a mixture of loam, peat and sand, and, like most hard wooded plants, it requires good drainage and firm potting. Propagation is effected by means of cuttings. These should be formed of the shoots of the current year, taken when in a half ripened condition, that is to say, when they have lost their succulent character and before they become too woody. They should be dibbled firmly in sifted, sandy peat, and placed in a close propagating case in gentle heat. A supplementary illustration of Elaeocarpus cyaneus was published in *The Gardeners' Chronicle*, October 15, 1904, prepared by the late Mr. Worthington Smith, from specimens supplied by Mr. Bedford, Straffan House Gardens, County Kildare, Ireland. *W. T.*

THE ROSARY.

SEASONABLE WORK WITH ROSES.

To carpet the Rose beds with Violas and other lowly plants, or to restrict them to Roses, is a question that has long vexed the mind of amateur rosarians. There is much to be said for and against both practices, but during the present abnormal season the advantages of restricting the beds to Roses have been most apparent.

Drought has been the great enemy, and unless there have been abundant labour and water available the carpeted beds have suffered. With the bare soil it has been a comparatively easy matter to stir the surface frequently, and thus obtain the fine, loose tilth that so effectively conserves the soil moisture. When this desirable state has been obtained it is a good plan to temporarily relinquish the hoe in favour of an iron-toothed rake, for this tool is much more speedy and is equally effective. Weed seedlings are but little bother, and weekly rakings under the broiling sun soon kill those that germinate, though many seeds will remain dormant, waiting for rains and a cooler atmosphere, and then the hoe must again be called into use. While hoeing alone is an excellent practice during droughts, thorough soakings of the soil are also to be recommended when circumstances permit. If the surface soil is bare, watering once in ten days will be sufficient even on light soils, if it is followed the next day by raking over the beds. Too much water, whether artificially applied or by rains, is well known as a fertile source of mildew.

Some object to mulching on account of the somewhat unsightly appearance of the material lying on the soil, but a mulch is such a valuable aid to Rose culture, particularly during periods of drought, that this objection should be quite a secondary consideration. Where a convenient supply of soil exists some gardeners place a layer over the mulch, others rake off two or three inches of soil from the bed, apply the mulch and place the soil over it. Both practices lead to weed troubles, for weeds soon put in an appearance.

With established beds, it is usually necessary to give some manurial assistance at this season, and in this one has the choice of watering with liquid manure, spreading a concentrated fertiliser on the surface, or applying natural manure in the form of a mulch. When artificial manure is used it should be worked into the surface soil and the latter well watered.

Those who require large blooms, for either show purposes or home decoration, must resort to disbudding, removing the side buds as soon as they can be handled; if this work is delayed there is but little advantage in disbudding. For garden display the best results are usually obtained from naturally grown bushes. The need for prompt removal of spent blooms is not so appreciated as one would expect. Most Roses seed freely and, when grown as standards and dwarfs, this seed production is exhausting to the plants. Many varieties will yield a later crop of bloom if the shoots are cut back about two-thirds of their length as soon as all the flowers on them have faded.

Although Roses this season have been exceptionally free from insect and fungus pests, aphides seem to be almost always with us. Forcible spraying does much to check these pests, but in cases of bad infestations other measures may be necessary. When the material is obtainable, nothing is better for the purpose than spraying with a quassia infusion. Next in order probably comes soft-soap wash, made by dissolving 1lb. of soap in 25 gallons of water. Many proprietary mixtures are valuable, but it must always be remembered that the growing Rose is a tender plant and the application of strong, corrosive mixtures may easily have disastrous results to the plant as well as to the pest. At this season the cuckoo-spit insect is often very troublesome and may become more harmful than is generally realised. This insect may be cleared by forcibly spraying with water, applying an insecticide, or by hand picking. Other insect pests, including sawflies, leaf miners and leaf rollers, have not been unduly troublesome as a rule, but at the first signs of injury by them resort should be made to hand picking or spraying. After the first rains a careful search should be made for the first appearance of mildew and rust, and the bushes sprayed with a solution of potassium sulphide, mixing half an ounce to each gallon of water, adding a tablespoonful of liquid glue to make the spray adhesive. *Devonian.*

NEW CHINESE CHERRIES AND PEARS.*

Among the numerous Cherries raised at the Arnold Arboretum from seeds collected by Wilson in Western China there are six which are good additions to the early spring flowering trees which can be successfully grown in the Eastern United States.

The handsomest probably is Prunus serrulata pubescens. This tree is of the same species as the Sargent Cherry (P. serrulata sachalinensis), but is smaller, rarely growing in the forests which are its home to a greater height than fifty feet; the flowers open nearly a week later and are white faintly tinged with rose, and somewhat smaller. The leaves, too, are less deeply tinged with bronze colour as they unfold. As it grows in the Arboretum the branches of this Cherry are ascending and slightly spreading, and form a narrow, open, graceful head. Plants raised from seeds which were gathered on the mountains of China only twelve years ago are seventeen or eighteen feet high, and have been covered this spring with flowers.

[*Photograph by H. M. Cox.*
Fig. 151.—Bauhinia sp. on the high slopes of the jungle (see p. 301).

Prunus serrulata spontanea differs from the last only in the absence of hairs on the young leaves and flower-clusters which are peculiar to that species, although the flowers, at least in some individuals, are slightly more tinged with rose, and the unfolding leaves are of a deeper colour. This tree is almost as widely distributed as the last but does not range as far north in Japan. Prunus canescens is a smaller tree. Its greatest beauty, perhaps, is found in the bark of the trunk which is dark orange-brown, very lustrous, and separates freely into large, persistent, papery scales much curled on the margins. The flowers, which are small and purple-rose colour, cover the leafless branches from end to end and are more fragrant than those of any other Cherry in the collection. Another Cherry which should find a place in collections for the beauty of its dark, lustrous, Birch-like bark is Prunus serrulata thibetica, an inhabitant of the forests which cover the high mountains of the Chinese Thibetan border. It has a low, broad, round-topped head with a trunk unusually large for the height of the tree. This tree has not yet flowered in the Arboretum. Prunus Dielsiana, in habit and colour of its bark, resembles the European Prunus Avium, but the flowers are slightly larger and sometimes faintly tinged with pink. Prunus pilosiuscula is a tree of medium size and is chiefly valuable for the earliness of its flowers which open with those of P. concinna and P. tomentosa; they appear before the leaves and are pink, and solitary or in small two or three-flowered, short-stalked clusters.

Among the Pear trees raised from seeds collected by Wilson in Western China Pyrus Calleryana has created the most interest among American pomologists, who now believe that they have in it a stock on which to graft the garden Pears more resistant to blight than any that has yet been tried; and the seeds now produced in large quantities by the trees in the Arboretum are sought by the Department of Agriculture of the United States and by nurserymen who are anxious to provide the country with a possible remedy for the disease which has destroyed many American Pear orchards. The new Chinese Pears have grown even more rapidly than the Chinese Cherries, and among them are beautiful clean-stemmed specimens from seventeen to twenty feet high, only twelve years old from the seed, and now giving every promise of reaching the height of fifty feet which these trees often attain on their native mountain sides. P. Calleryana is a shapely pyramidal tree more compact in habit than the other Chinese species. The flowers are smaller, and the globose, brown fruit is hardly more than a third of an inch in diameter.

To all students of cultivated fruits Pyrus serotina, another of Wilson's introductions, is of particular interest, for this tree of the mountain forests of Western China is now believed to be the origin of the brown or yellowish, round, hard and gritty Sand Pears which, in many varieties, the Japanese have cultivated from time immemorial and which must have been introduced into Japan probably by the way of Korea. In the early days of Western intercourse with Japan, many varieties of the Sand Pear were brought to the United States and Europe, but except for the beauty of their flowers and fruits they have proved to be of little value, for the fruit is so hard and so full of grit that it is not even worth cooking. It was probably forms of the Sand Pear crossed with one of the cultivated garden Pears which produced the Leconte and Keiffer Pears from which much was at one time expected in America, especially in the Southern States, but which have proved so susceptible to blight that the cultivation of these trees has been now largely abandoned. The flowers of Pyrus serotina are larger than those of P. Calleryana, but there is little beauty in their small brown fruit; and the habit of the tree, with its long spreading branches forming an open irregular head, is not particularly attractive. Of better habit is Pyrus serrulata, a fast growing tree with large flowers which have been only sparingly produced in the Arboretum. The Chinese form of Pyrus pashia raised from Wilson's seeds is also established in the Arboretum, where it has just flowered. The Himalayan form of this tree was first sent to Europe in 1825, but has not been tried in the Arboretum.

In addition to these four Pear trees from Western China there are five other Chinese species in the Arboretum, P. ussuriensis, the wild Pear tree of Korea and Manchuria, and extending into northern China and into Japan; P. Bretschneideri, a northern tree with grey yellow fruit of good flavour; P. ovoidea, another northern species with yellow fruit tapering from a broad base to a narrow apex; and P. betulaefolia and P. phaeocarpa, species with small brown fruit, that of the latter globose on some individuals and pyriform on others. Taken as a whole the Chinese Pear trees make one of the most interesting groups in the Arboretum, and as early spring flowering trees they take rank with the Crab-apples, although the open flowers, which are often tinged with pink while in the bud, are white and so lack the variety of colours which add so much beauty to the flower buds and blossoms of the Asiatic Crab-apples.

* *Arnold Arboretum Bulletin of Popular Information.* New Series, vol. v., No. 3. (Cambridge, Mass, U.S.A.)

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM PLATYCHEILUM.

In the early nineties a few plants of a small-growing Orchid purchased at a sale, without name or habitat, appeared in gardens, and later one of them flowered in Mr. Measures' collection at Camberwell and received an Award of Merit at the Royal Horticultural Society on March 22, 1892, as Odontoglossum platycheilum. The flowers were white with a pale pink tinge on the labellum, which was decorated with purplish red spots, the petals also having a few brownish red markings at the base. On April 28, 1908, O platycheilum superbum, with a darker rose shade, was shown by the late Sir Trevor Lawrence, Bart., and gained a similar award. For some years no definite particulars had been gleaned as to the habitat of the plant, and no importation had been made, but the species was generally considered to be a native of Central America. The plant has since been identified at the Kew Herbarium with dried specimens in the collection of Mr. Oakes Ames, gathered at Chiul, in the Department of Quiché, Guatemala, altitude 2,600 metres, in April, 1892.

With the exception of a few plants imported by Messrs. Sanders, no stock of this pretty little species has been distributed, and its appearance in gardens is rare. So much so that when a good example of it was shown in the group staged by Mr. Harry Dixon, Spencer Park, Wandsworth Common, at the Chelsea show, many orchidists failed to recognise it. O. platycheilum appears not to have been made use of by the hybridist, which is rather an oversight, for its very distinct form and neat habit suggests that it might be a satisfactory parent crossed with other Odontoglossums or Miltonias. Probably its modest proportions may have caused it to be slighted, but when the results of using the small-flowered Cochlioda Noezliana and other species of moderate size as parents are considered, the experiment would be worth making.

FIG. 152.—ODONTOGLOSSUM PLATYCHEILUM: FLOWERS WHITE, WITH PURPLISH BROWN SPOTS.

VERONICA SAXATILIS.

Of the mountain Veronicas, few are greater favourites with Alpine lovers than V. saxatilis, the rock Speedwell. It is an occasional denizen of some of the Scottish mountains, where it inhabits the higher parts, but it grows well in lowland gardens under the treatment generally afforded to other alpine flowers. V. saxatilis will do well on rockwork, and according to a well-known authority it is the "easiest and most thriving of Veronicas." It is also one of the prettiest species, though its flowers are short-lived. Yet they are charming, with their brilliant blue colouring, set off by a basal crimson ring, while they harmonise well with the glossy foliage, which grows near the ground. There are several varieties—one called fruticulosa, which is rose coloured; another named Grievei, of a different shade of rose, and a third called Balfouri, of a deeper blue. This delightful little Speedwell will succeed in the usual compost afforded to other alpines. It grows in peat, but that material is not essential, and loam, leaf-mould soil and sand form a suitable rooting-medium. The plant succeeds both in sun or partial shade, and it must be a cause of regret that it seems to be less in favour than twenty or more years ago. *S. Arnott.*

The Week's Work.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Climbing Roses.—Climbing Roses planted in narrow borders will need copious waterings at the roots. Keep the shoots neatly secured, the leaves free from insect pests and syringe the plants freely late on fine bright afternoons to keep the leaves healthy and clean.

Vases on Terraces.—Plants in vases should receive every attention. Stake and tie the growths and afford abundance of water to the roots to encourage rapid growth and a display of flowers.

Pyrethrum.—For general decoration and for cutting, Pyrethrums are among the best hardy perennials. They thrive in deeply-cultivated, rich soil, and are readily raised from seed or increased by division of the roots. At the present season plants thoroughly established should be well supplied with water and liquid manure, and mulched with decayed manure.

Dahlia.—Support Dahlias to stout stakes and do not train up too many shoots. Retain the stronger and remove the weaker growths. Afford a mulching where the soil is light and water freely in dry weather.

Seasonable Reminders.—June is a very busy month in the flower garden and all labour possible should be utilised to keep pace with the work. The requirements of all kinds of bedding plants should be attended to so as to secure a display quickly. Water should be supplied freely to all bedding plants late in the afternoon. Keep the surface soil over the roots loose, as nothing is more harmful to growth than a hard, baked surface.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Parsley.—To maintain an unbroken supply of Parsley during the winter and spring months, seeds should be sown in well prepared ground. Add lime rubble or burnt earth to the surface of the seed bed if the soil is of a heavy nature, and choose a site with a south or western aspect. In districts where Parsley is a partial failure during the winter, seeds should be sown direct in frames, or even turf pits, where lights can be used during the winter. This latter method should always be adopted where possible. Thin the seedlings to 6 inches apart, hoe between them regularly, and dust with soot at intervals. Sutton's Winter and Perfection are two excellent varieties.

Tomatos.—A sowing of Tomato seeds should be made for ensuring a late autumn and winter supply of fruits. Sow in pots, and place them in a shady part of a greenhouse. The seedlings will soon appear, and they should be potted as necessary until the final 8-inch pot is reached. Grow the plants sturdily until 4 to 5 clusters of blooms have set, when the points of the leading growths should be stopped to assist the fruits to develop. Winter Beauty and Sunrise succeed well under this treatment.

Endive.—Make a liberal sowing of Curled and Batavian Endives to maintain a plentiful supply of salads during the autumn. Always water the drills previous to sowing the seeds, and use finely sifted soil for covering them.

Runner Beans.—Another sowing may still be made to provide a late autumn crop after the earlier rows become exhausted.

Broccoli.—The autumn varieties should be planted out with all possible speed. Plant in firm ground, at 2 feet apart, and afford water until the plants are established. Finish the planting of autumn Cauliflowers.

Lettuce.—Make frequent sowings of Cos and Cabbage Lettuces to supply the demand. The ridges of Celery trenches form an ideal position for these crops.

Mulching.—Perhaps no season can be remembered wherein mulching was more needed than the present. Old Spinach stems may be laid along the rows of Peas and Beans. Stable litter and partially decayed leaves provide a good mulching for heavy soils, whereas heavy and partially decayed manure may be used on light soils. In the absence of manure, ply the hoe freely among the crops, and top dress with the accumulated decayed material from the garden rubbish heap.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Lackey Moth on Apples.—This troublesome pest seems to be very prevalent this year in certain districts, and the hot, dry weather is all in its favour. The caterpillars usually appear in April and May, and form large colonies in a web which is enlarged as required. From this web the pests emerge to feed and return again at night, and in wet weather. They remain for some time in these colonies, but when full grown they separate and make cocoons. To destroy the caterpillars a cloth should be spread under the trees, and the latter shaken vigorously; the pests will fall on to the cloth, and may then be gathered and killed. Where the attack is very bad the nests of webs and caterpillars should be cut off, dropped into a pail, and then burnt. The best remedy is continual cleanliness, *i.e.*, the removal of loose bark and rubbish from the trees in winter, and winter spraying. Spraying the trees with Paris green at the rate of one ounce to 18 gallons of water before the blooms expand, is a good remedy, but when this material is used care should be taken to see that none of it comes into contact with anything likely to be eaten raw.

Gathering Strawberries for Dessert.—Too much care cannot be taken in gathering Strawberries for dessert as over-ripe, under-ripe or otherwise defective fruits spoil the dish. The best time for gathering is in the morning, as soon as the dew has gone, as the fruits are then cool, and in the best condition. They should be gathered with sufficient stalk by which to hold them. Mice are sometimes troublesome, as they are fond of Strawberries, and will soon do a lot of damage by nipping off the fruits. Where cats are kept in the garden they generally look after mice, but where they are not permitted it is necessary to use traps, and the best of these I know is the break-back Little Nipper, baited with cheese or bacon. It is a good plan to trap mice before the fruits ripen.

Suckers on Fruit Trees.—Many fruit trees, and particularly Plums, produce sucker growths, and these, if not removed, tend to weaken the trees. Suckering is often the fault of the stocks that are used. To remove them the soil should be carefully taken away from the roots and a sharp knife used to cut them out. If pulled off or broken near the surface new sucker growths will appear.

Thinning Plums.—This work should now be done where necessary. It is a mistake to allow a very heavy crop as this exhausts the trees for the following year. It is rarely that Plum trees carry heavy crops two years in succession. Trees which have not been watered during the recent hot weather will cast many fruits, therefore it is necessary to see that the fruits are properly set before thinning is done.

Watering.—All kinds of fruit trees should receive copious supplies of water; if allowed to become dry now, many trees will cast their fruits. Liquid manure should be given occasionally.

Protecting Fruits from Birds.—Raspberries and Currants planted against south walls for the production of early crops, should be netted as soon as the fruits show signs of colouring. The very dry weather and scarcity of fruit will render the crops liable to the attacks of birds if not protected early.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Autumn and Winter-flowering Plants.—Cyclamens, Heliotropes, Celosias, Cockscombs, and Balsams should be repotted before they become pot-bound, and during the warm weather they may be grown in unheated pits or frames, arranging them so that they are near the glass. Close the frames early to obtain the full benefit of sun-heat, and give the plants an occasional spraying with quassia extract to keep them clean.

Salvia splendens.—This is a most useful autumn-flowering plant. Cuttings rooted early in the season, treated liberally and potted as necessary in a rich compost, will make good specimens by the autumn. During the warm weather the pots should be plunged in a bed of ashes, in a shaded spot out of doors. When established in the new soil, they should be fed liberally with liquid manure. As they are subject to attacks of red spider, syringe them frequently with clear soot water.

Bouvardia.—Young plants rooted this spring should be potted into larger pots as required, in a compost of good, turfy loam, leaf-mould, and sand. Grow them in a house with a medium temperature and moist atmosphere. Pinch out the points of the shoots to induce the formation of bushy specimens. Spraying the plants twice daily will keep them sufficiently moist at the roots for the time being.

Herbaceous Calceolaria.—Calceolarias are most serviceable at this season of the year in the conservatory, and they should be kept shaded from bright sunshine. Fumigate them occasionally to check green fly, and remove any growths that have finished flowering. Add a little artificial manure to the water when supplying water. To raise plants for flowering next season, sow the seeds in July, in pans, on the surface of light soil made thoroughly moist previously. Place the pans in a cold frame in a shady position, and cover them with a sheet of glass until the seeds have germinated.

Primula.—Greenhouse Primulas raised from seeds sown in the early spring and afterwards grown in boxes in favourable conditions, should be potted in a compost of two parts turfy loam, one part leaf-mould, and some sharp sand; place them in a cold frame or cool greenhouse, and give shade and water as necessary.

Campanula pyramidalis.—Seeds should be sown now to provide plants for flowering next season. One year old plants, showing flower spikes and growing in pots, should be kept out of doors in a shady place until the flowers begin to open. Feed them liberally until they are placed in the flowering house or conservatory.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Epidendrum prismatocarpum.—This species is now flowering, and it is a fine Orchid for exhibition purposes. If properly grown it is robust, free-flowering, and remarkable for the lasting qualities of its flowers. Frequent root disturbance is resented by this species, but when really in need of fresh material the plants should be turned out of their pots directly they have done flowering. Remove decayed roots, bulbs and rhizomes, also sour compost, and pot the plants in larger or smaller pots, according to their condition. The roots should not be too much restricted, but to prevent sourness in the compost add plenty of hard, porous material and drain the pots thoroughly. The usual mixture of Osmunda or A1 fibre and Sphagnum-moss in a rough condition, suits this species well. Make the material firm about the roots and keep the bases of the pseudo-bulbs about on a level with the rim of the pot. Being a strictly evergreen plant the water supply must be regular so long as growth is active, and even when at rest water must not be withheld entirely. A position in the Cattleya house or similar structure, where plenty of light and air is secured, with shade from bright sunshine, is suitable for this Orchid. Insects seldom trouble plants thus grown, but should scale or red spider put in an appearance they must at once be destroyed, or the fine healthy appearance of the foliage will soon be marred.

E. vitellinum majus.—This very ornamental and easily grown Orchid usually flowers during the summer months. If kept in a shady position its flowers will last two to three months in perfection, but it is not wise to allow the spikes to remain for so long on the plants, or the latter will not have sufficient time or strength to develop flowering pseudo-bulbs for another season. The cultural requirements of this species are like those of E. prismatocarpum, except that it should be afforded a cool, moist temperature all the year round. The plants are easily cultivated, and being of dwarf habit, they may be grown in shallow pans suspended from the roof rafters close to a ventilator, as they delight in abundance of fresh air.

E. radicans.—This species, and its hybrids E. O'Brienianum and E. Boundii, are beautiful Orchids flowering now, and it is astonishing the length of time the individual spikes will continue in perfection, for as fast as the lower blossoms fade, fresh flowers open at the top. As these reed-like Epidendrums produce aerial roots freely, propagation is easily effected by removing a portion of the growth with roots attached. Given a cool-intermediate temperature, and a position where the plants receive plenty of light and air at all times, and frequently syringing the plants during bright weather in summer, their cultivation is easy. Desirable specimens may be had by planting a number of stems together in well-drained pots and training the stems round neat stakes. All through the summer and while these plants are in full growth afford them plenty of moisture at the roots and in the atmosphere.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Mid-Season Grapes.—Grapes intended to ripen in succession to the earliest crop are colouring. They should receive plenty of air on every favourable occasion, and less atmospheric moisture will be necessary, but the structural conditions of the house must be taken into consideration with regard to the supply of moisture in the atmosphere. In lofty, well ventilated houses damping should be more frequently done than in a low, badly ventilated house. Admit a little air during the night through the top ventilators, but maintain a little warmth in the hot-water pipes to ensure a circulation of air. This will prevent condensation of moisture on the berries and tend to prevent the berries from cracking and splitting. The foliage should be frequently examined, and on the first signs of red spider sponge the affected leaves with a suitable insecticide. Where the vines are growing close to the glass, a slight shade may be necessary to prevent injury to the leaves from the sun's rays. Summer cloud lightly sprayed on the glass answers the purpose admirably.

Strawberries.—As the end of the forcing season has arrived, the necessary preparation for next year's supply of plants for forcing will need attention. For very early forcing an early start is essential to secure strong, healthy plants. The best runners are obtained from plantations made the previous year, and which have not been allowed to flower. The plants set apart for the production of runners should receive plenty of water during dry weather. King George and Royal Sovereign are excellent varieties for forcing. For the earliest batch I prefer to layer the runners into small 60-sized pots. These pots are soon filled with roots and the plants are quickly ready for transferring to their fruiting pots after removal from the parent plants. The later batches may be layered direct into their fruiting receptacles. In all cases use clean pots, afford good drainage, and take means to keep the pots free from worms after the final potting. The later batches of forced Strawberries grown under cool treatment may be turned to good use in forming an early fruiting plantation out of doors.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JUNE 24—
Floral Fête and Exhibition in aid of the Royal Horticultural War Relief Fund, Royal Hospital, Chelsea (3 days).
Royal Agricultural Society's Show, Cardiff (4 days).

WEDNESDAY, JUNE 25—
Croydon Horticultural Society's Rose Show at Park Hill Recreation Ground, Croydon.

FRIDAY, JUNE 27—
City of London Rose Show at Cannon Street Hotel.

SATURDAY, JUNE 28—
Windsor Rose and Horticultural Show.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 61.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, June 18, 10 a.m.: Bar., 30.1; temp., 69°. Weather—Dull.

The Drought. Although it is always dangerous to generalise with respect to the crops of a country so little uniform in soil and climate as Great Britain, it is probably as safe as it is sad to say that the weather conditions culminating in the prolonged droughts have spoiled all chances of a bounteous harvest. Even under the relatively intensive cultivation which obtains in gardens there are reports of many failures, and in the light soils early crops—as, for example, Peas—are very small indeed. If this be so in the case of land which can be cultivated continuously and mulched, the disappointments experienced on land under less intensive cultivation are bound to be severe. For these disappointments the drought, though the chief, is not the only cause. The prolonged period in the early part of the year during which work on all but the lighter soils was impeded caused an accumulation of arrears which the shortage of labour has made it impossible to overtake. After that period of waiting the sudden arrival of summery weather led many people to entertain high hopes that, after all, Nature intended to be kind to us, though the wise gave the warm weather of late spring only a dubious welcome. Yet, who could help being hopeful when the fruit trees put forth such a marvellous wealth of blossom? As the dry weather continued it became evident, however, that the fruit crops could not be other than light, if only because any condition which tends to check natural growth acts automatically in favour of plant enemies. And so it has come to pass. Insect pests are ravaging the orchards of the country, and the general public, unaware of the difficulties with which growers have to contend, and childishly credulous of the value of improvised remedies for evils of origin long anterior to their manifestation are wondering what steps we might now take to stop the ravages of the pests which are spoiling our crops. The experienced grower, whilst doing all he can with the labour at his disposal, knows full well that when weather conditions are so against him, as is the case this year, remedial measures applied at the eleventh hour are very costly and must, if they are to repay their cost, be persisted in with expensive thoroughness. These measures, moreover, increase the costs of production, which is a serious matter, particularly at the present time, when they are already high, and what is no less unfortunate, extremely difficult to compute.

Although it is not to be doubted that the first crops will be disappointing, it is even now very difficult to form an estimate of these crops. So far as may be learned, the Gooseberry crop, which is so important to the jam boiler, and was of such excellent promise, will not be better than that of last year. Strawberries are bound to be a light crop. Plums are, apparently, still uncertain, though Pershores, famous for their consistency of cropping, are said to be below the average. This year should be a Damson year, but it seems likely that this fruit will also be a partial failure. Pears are said still to promise a good crop, but the prospects of a satisfactory yield of Apples are diminishing rapidly

Here and there, however, occasional rains have fallen, and where that has been the case these gloomy prognostications will not hold. Growers in these districts will probably do well, but it is to be feared that, in general, they will have little chance of recouping themselves for the losses which last year's scarcity and controlled prices imposed upon them. For one thing, at all events, the commercial fruit growers may be thankful, and that is the abolition of controlled prices. One of the necessary evils which had to be accepted during the war, their continuation in peace or quasi-peace time, could not be defended. It is a relief to turn away from this tale of misfortune to the garden which, in spite of drought, has been, and remains wonderful in its wealth of blossom, evanescent perhaps, but brilliant beyond the usual: for the high temperature and bright sunshine, which are unkindly to fruit growers, are friendly to the first stage thereof—that of the formation of flowers — and well-established garden plants are enjoying a season of exceptional floral beauty.

Royal Horticultural Society's War Horticultural Relief Exhibition.—The Royal Horticultural Society, in establishing the War Relief Fund to supply our Allies with seeds, plants and implements to restore their gardens and orchards, has not only done a most commendable charitable act, but has fulfilled a national duty. With the object of bringing home to the masses of the people the reality of the necessity for adequately sustaining this movement, the committee of the War Relief Fund is holding a Floral Fête at Chelsea Hospital Gardens on June 24, 25 and 26. All the resources of the Royal Horticultural Society are being used to help to make the Fête a great success. Leading horticulturists, both amateur and professional, are sending gifts of flowers. The National Sweet Pea Society, the British Carnation Society, and the National Rose Society are all contributing exhibits, and awards, including the Wigan Cup, the "blue riband" of the Rose world, will be bestowed just as at the regular meetings of the society. There will be plenty of other popular attractions at the Fête, which is designed to draw attention to the real work of the fund as well as provide a splendid round of intellectual entertainment. The admission has been fixed at one shilling, except during the first part of the opening day. Mr. Reginald Cory, Duffryn, Cardiff, has contributed £1,000 to the fund in connection with this Floral Fête. The Queen, who has displayed the deepest interest in the War Relief Fund of the Royal Horticultural Society, has intimated her intention of sending a special assortment of flowers and fruit from the conservatories and grounds of Windsor Castle, for sale at the Fête, and the royal gifts will be sold at the stall presided over by Mrs. James Lowther.

Women Gardeners at Kew.—As the journeymen gardeners return from the war, or suitable new men apply for admission, they are taking the places of the women gardeners at Kew. A year ago upwards of forty women were employed in the greenhouses, herbaceous ground, and flower garden. Less than a dozen now remain.

Royal Society of Arts.—The One Hundred and Sixty-fifth Annual General Meeting of the Royal Society of Arts will be held on Wednesday, June 25th, at 4 p.m. The Council attended at Clarence House on Friday, the 6th inst., when His Royal Highness the Duke of Connaught and Strathearn, K.G., President of the Society, presented the Albert Medal to Sir Oliver Joseph Lodge, D.Sc., LL.D., F.R.S., "in recognition of his work as the pioneer of wireless telegraphy."

War Cultivation in the Royal Parks.—The report published by the First Commissioner of Works on the financial results of planting food crops in the Royal Parks shows that that essay in food production proved eminently satisfactory. The profits range from £655 at Bushey to £11 8s. 5d. at Greenwich. The utilisation of vacant glass-houses in Hyde Park resulted in a profit of £425 2s. 7d., and at Regent's Park food crops grown in the vine-house brought in £152 11s. 2d. In one case only, that of Richmond Park, was there an adverse balance, and it amounted to £120 18s. 1d. The net profit derived from all the cultivations—after deducting this loss—was £1,638 6s. 9d. Besides this profitable side of the movement the model allotments established in Kensington Gardens were a means of instructing many beginners and many allotment-holders in the art of vegetable gardening.

St. Dunstan's Flower Show.—The splendid work of St. Dunstan's Institute for Blinded Soldiers ensures that any well-devised scheme having for its object the augmentation of the Institution's funds will appeal strongly to everyone. The flower show, which is to be held on behalf of the funds in the Royal Hospital Gardens, Chelsea, on July 2, 3, 1919, will have the support of both traders and amateurs. Classes are provided for both indoor and outdoor flowers, fruits and vegetables in a manner that should enable every owner of a garden to show something. Floral art will also be a great feature, and there will be exhibits of horticultural sundries. Over 200 silver cups and pieces of plate, ranging in value from £2 10s. to £50, are offered, as well as 100 silver and 100 gold medals. Schedules and particulars may be obtained of the Organising Secretary, Mr. T. Geoffrey W. Henslow, 306, Regent Street, W.1.

Visitors to Kew.—On Whit Monday, the 9th inst., 48,000 people paid for admission to Kew Gardens, the receipts exceeding £200. This constitutes a record attendance since a charge for admission was instituted in January, 1916. Picnic parties were much in evidence, and the National Kitchen Department of the Ministry of Food, which now controls the refreshment pavilion, was very hard pressed during the teatime rush.

Victory Loan Demonstration in Trafalgar Square.—The demonstration in Trafalgar Square arranged for the Victory Loan has now been fixed for Thursday, June 26th, and two following days in order to avoid clashing with the Floral Fête of the Royal Horticultural Society War Relief Fund at Chelsea Hospital Gardens, which is fixed for the 24th, 25th, and 26th. The Trafalgar Square function was originally designed as a floral fête, but the scope and even the title will be broadened to include many other attractions, including a huge choir. The Committee of the Royal Horticultural Society is now co-operating with the Victory Loan Committee by sending

y surplus flowers left over from their Fête to falgar Square. It was realised that the ught has had a serious effect upon the output flowers, to the extent of rendering the supply both functions precarious. By the re-arrangent the best interest of two of the most tstanding efforts in reconstruction have been died and over-lapping avoided.

Kew Post Office.—All Kewites will learn with terest and some measure of regret that the old at office at Kew Green is likely to be closed. fact a notice has been posted on the door ating that the office would be closed on June 14 st. This step was due to the inability of the thorities to find a successor to the present postistress, the small remuneration of £140 not ing tempting enough. On Monday last we found hat the office was still open, and on inquiry ere informed that the present postmistress had een requested over the 'phone early that morng by the G.P.O. to temporarily continue, so it ems probable that a successor has been found. therwise there will be no office or public telene facilities nearer than Kew Gardens station. e Kew Green office has been in existence for

society, which he subsequently sent to the society. It was impossible to guess how the seal had left the custody of the society to be now found in possession of an "illiterate" man; the only entry in the minutes was in March, 1789, "Ordered, that the seal exhibited be engraved." The seal itself was in use until the granting of the Patent of Arms in 1802, for there was an Order in January, 1803, for the immediate engraving of the present seal, "with the arms of the society." The exhibitor put forward a possible explanation as to why the original seal was suffered to leave the custody of the society, to which it had now been returned after more than a century's absence.

Phaius grandifolius in the Botanic Gardens, Hongkong.—The illustration kindly sent by Mr. W. J. Tutcher, Botanic Gardens, Hongkong, of between forty and fifty pots of Phaius grandifolius, reproduced in Fig. 153, gives an idea of how this Orchid grows in Hongkong. Mr. Tutcher gives the following particulars. The plants are growing in 10-inch pots filled with a mixture of equal parts ordinary garden soil,

day. The challenge cup and trophies won at the show will be presented at the conversazione.

Cabbage Lettuces at Wisley.—Visitors to Wisley will find the trial of 284 Cabbage Lettuces, raised from seed sown on April 7, exceptionally interesting. All types of the Cabbage Lettuce are represented, from the large, loose, non-hearting kinds to those of the small, Tom Thumb section. As is to be expected in such a large collection, many of the sorts are synonymous. There are two long rows of each variety, one of plants growing where they were sown, and the other of those transplanted. The difference between the two rows in every case is most marked, those growing where they were sown being, on an average, almost double the size of the transplanted ones, and, moreover, the latter in many cases show indications of bolting, which are absent from the others. Members of the Fruit and Vegetable Committee of the R.H.S. inspected the trial on Friday, the 13th inst., and it was the unanimous opinion of those present that it was the finest trial of vegetables they had seen.

Fig. 153.—PHAIUS GRANDIFOLIUS IN THE BOTANIC GARDENS, HONGKONG.

ver 150 years, and has been controlled by the rrey family for 106 years.

Linnean Society.—At the meeting of the innean Society held on the 5th inst., the general ecretary exhibited a medallion portrait in ronze of Carl von Linné, hitherto unknown, nd wanting in Professor T. Tullberg's *Linné-ortrātt*, the comprehensive catalogue of Linnean ortraits. The base of the head showed the ame "G. Wallis." George Wallis (1811-91) was n art teacher in London, Manchester and Birmingam, and became Keeper of the Art Collections, outh Kensington, in 1858, a position he etained till the year before his death. Like early all plastic representations of Linné, it as made from portraits, as the period of the rtist declares. The medallion has been kindly ent for exhibition by Mr. W. J. Wintle, secreary of the Malacological Society. The secretary lso exhibited the original seal of the society, hich had been lost since the beginning of the ast century. A month previously he received letter from Mr. John Slade, of Worthing, tating that on winding up the estate of an old entleman of more than 90 years of age, he ound in a deed-box the original seal of the

Canton mud leaf-soil, and old stable manure. After the plants have finished flowering they are divided and repotted. As soon as they have become established in their new pots, a small quantity of Clay's fertiliser is given them every week up to the time they begin to open their flowers. They grow best in a somewhat shady situation. Most of the pseudo-bulbs send up two scapes of flowers, and occasionally there are three scapes to a pseudo-bulb. In Hongkong the plants grow wild on the banks of streams, but they are never such fine examples as those shown in the photograph.

National Sweet Pea Society.—The annual exhibition of the National Sweet Pea Society will be held, in conjunction with the Royal Horticultural Society's Meeting, on July 1, 1919, in the London Scottish Drill Hall, Buckingham Gate, Westminster. The Secretary, Mr. Henry D. Tigwell, asks us to announce that entries for the competition classes must be sent to him on or before the 24th inst., at Harrow View, Greenford, Middlesex. The Society will hold a dinner and conversazione at the Holborn Restaurant, at 7.30 in the evening of the same

They congratulated the Superintendent, Mr. S. T. Wright, and the Fruit and Vegetable Foreman, Mr. J. Wilson, on the superb condition of the plants. As most readers are aware, the soil at Wisley is very sandy, and the trial was a splendid object lesson of how well plants succeed in light soil in a dry season when the hoe is used freely to promote a fine tilth. At the R.H.S. meeting on Tuesday last the Committee recommended the Council to give Awards of Merit to several varieties and highly commend others.

Registration of Novelties.—At the Horticultural Congress, held in Paris at the beginning of June, one of the principal questions discussed was that of the registration of novelties and the protection of the rights of the raisers. To many, the problem seems insoluble, and there appears no means of securing the rights of a producer in a plant, in the same way as they are secured to the producer of a work of art or literature. The Congress recalled what had already been attempted, namely, the registration of novelties in a list, national or international, with the description of the plant, and the issue of a certificate to the

raiser, and thought the matter might well be studied by a special commission. The demand was formulated that the names of plants submitted for award should in every case be followed by the name of the raiser or introducer. On the proposition of Monsieur Rivoire, of Lyons, the Congress resolved that a national bureau for the study of novelties should be created, with a sufficiency of funds for the purpose.

Gift of Reed Mats to Belgian Horticulturists.—The Gardeners' Company is endeavouring to raise a fund of £12,250 in order to supply reed mats to Belgian horticulturists. The company has already telegraphed to Belgium an order for 29,000 mats as a first instalment. It was stated at a meeting held by the company on the 11th inst. that, in 1913, Belgian horticultural exports exceeded £610,000, and the whole volume of trade has now to be rebuilt. The most pressing need is for reed mats to replace those commandeered by the Germans. The Clerk (Mr. E. A. Ebblewhite), in announcing subscriptions to the fund, said that all the glass-houses of Belgium were exposed to the elements, the glass being destroyed, and the plants required protection. Each mat would cost about 1s., and the gift would be doubly beneficial, as the mats would be made by Belgians otherwise out of employment. The company had that day voted £200. Sir Charles Wakefield had given £1,000, and among other contributors were: Mr. Joseph Francis, £250; Mr. Renter Warden Agar, £250; Mr. Julius Weil (Master-elect), 100 guineas; Capt. Sir Rowland Blades, M.P., 50 guineas;; and Mr. C. G. Ashdown, Capt. Hansford, C.B., and Mr. E. A. Ebblewhite, 25 guineas each. The grand total was £2,560.

Onion Smut in Great Britain.—This disease, due to the fungus Urocystis cepulae, Frost, which causes serious losses to Onion growers in the United States and in Europe, is probably new to this country. At all events no authenticated record of its occurrence in England previous to this year is to be found, although it is known to have appeared in Edinburgh about seven years ago. In any case, as recorded in the *Journal of the Board of Agriculture*, Onion Smut has now appeared, and every means must be taken to prevent it from establishing itself. It is probable that it was introduced with foreign seed. Attempts were made in the case of an outbreak at Northampton to trace the origin of the seed, but, beyond the fact "that it was purchased locally," no information could be obtained. As a result of the publicity given by the Board of Agriculture to the occurrence or recurrence of this disease, it was pointed out by Mr. S. P. Mercer that an outbreak had occurred in 1914 in Northumberland, when Leeks —which are very susceptible to the disease—were attacked. Onion Smut may be recognised in its early stage by the presence of dark opaque spots or streaks on the leaves. At first, covered by the skin of the leaf, the streaks soon become ruptured and expose a sooty mass of spores. The liberated spore masses contaminate the soil. The plants are only attacked in the very young stage, infection occurring below the ground level, probably in the first leaf. Hence, at least so far as gardeners are concerned, it is easy to prevent the disease by raising seedlings in sterilised or uninfected soil and transplanting them, for by the time they are ready for transplanting, all risk of infection is past. The spores retain their power of infection for years, and records in America indicate that even after twelve years an infected field may still produce the disease. In case of an outbreak it is of great importance that diseased plants should be pulled up and burned, if possible before the spores have been shed.

Price of Vegetable Seeds in Lille during the War.—In the course of an interesting article in *Jardinage*, May, 1919, on horticulture in Lille during the war, Dr. Ad. van der Heede mentions that the price of vegetable seeds in Lille rose to enormous heights. For example, Leek seed cost £18 per pound, Carrots over £1 per pound. The seed was smuggled at the risk of the smugglers' lives—all importation being forbidden.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Reconstruction.—For many years past there has existed among a small section of young English gardeners a desire to improve and extend their knowledge of their profession and learn a foreign language by a visit abroad. There have been some notable cases in which these men have reaped substantial reward for their voluntary exile. The number of them has, however, been far smaller than that of young foreigners who have come to England for a like purpose. Thirty years ago a few French gardeners, resident in London, recognising the advantage of united effort in this direction, founded the Société Française d'Horticulture de Londres. Under the benign influence of its highly respected president, George Schneider, a Frenchman long resident in this country, the society flourished and did invaluable work. It placed young French and Belgian gardeners in suitable situations in this country, not, be it observed, as competitors, and to a very much more limited extent because of the smaller demand, it found places on the Continent for those young Englishmen who desired to gain a continental experience and acquire a foreign tongue. But George Schneider is dead, and, alas! there appears to be no one competent to fill the vacant place. Philippe de Vilmorin, the honorary president whose influence was far-reaching, is dead also, and the society for four years and a half has been absolutely dormant because all its active members in this country were obliged to return home and fight in the defence of their native land. The society, however, does not consist wholly of foreign members —many prominent English nurserymen, gardeners and others who have, from an international point of view, almost as great an interest in the revival and maintenance of the society as those on the other side, were in pre-war days active supporters of it. I do not hesitate to say that if English horticulture is to preserve and extend the excellent relations that have always existed between it and continental horticulture, more necessary perhaps after peace than ever before, it will soon be time for somebody to make a move in the awakening of the society. Young English gardeners, the sons of nurserymen, seedsmen and others in the trade who desire to perfect themselves in their calling, ought not to be debarred from the facilities for doing so. Continental ones, too, will also require the means of reciprocal interchange, and it needs no great business acumen to say that the revival of the active working of such a society will be as productive of substantial benefit to English as it will to French, Belgian, Swiss and other French-speaking horticulturists. *C. H. P.*

The Garden Chafer (Phyllopertha horticola).—This insect is causing serious damage to the Apple crop in the Leatherhead and Dorking district of Surrey. In some gardens the chafers are so numerous that three of them may be seen feeding on one fruit; they also devour the leaves, and in many instances this would seem to be their usual food, as none of our standard works on gardening mention the fact that young fruits are eaten, with the exception of *Johnson's Gardeners' Dictionary* (2nd ed.). The attack appears to be rather local at present and is said to occur chiefly where the soil is sandy. Some people have not seen the pests until this season, and there are those who say it is a new pest from California, which shows that its numbers are increasing. In colour it is brown, with a dark purple head, and the under wings are pale brown; its shape is very similar to that of the common May Bug or Cock Chafer (Melolontha vulgaris), but it is only about a quarter of the size, and flies more swiftly. It lays its eggs in the ground or in heaps of manure; these soon hatch, and live about three years in the grub or maggot stage under ground before developing into the perfect chafer. During this time they feed on the roots of grasses and other plants. Birds are said to destroy them when they can find them. In the beetle or chafer stage, spraying the trees with arsenate of lead stops their ravages, and they may be shaken off the trees on to a cloth and burnt. Where they become plentiful the destruction of young fruits and foliage is terrible, and every means should be taken to stop their increase. The insect bears the common names of Bracken Cleek or June Bug, and is known to anglers by its old Welsh name of Coch-y-bondhu, often corrupted by them into Cockerbundy. *W. H. Divers, V.M.H.*

Variability in Plants (see pp. 251, 285, 299).—I am much obliged for the exceedingly interesting contributions from *W. T.* and *J. F.* Since first writing, my attention has been called to a Fuchsia with a whorl of four leaves, and also to a case the opposite of the specimen of Fuchsia Riccartonii mentioned by *W. T.*, in which the main stem of the plant had opposite leaves, and the minor stems leaves in whorls of three. But what does it all mean? May I suggest one line of explanation, which, whatever it may be worth in itself, may perhaps set other minds thinking? Evidently, with tricotyledons appearing so commonly as seems to be the case, the Fuchsia, at any rate, cannot be regarded as a dicotyledonous plant, pure and simple. A three-fold arrangement appears to spring from within its nature, as well as a two-fold, while a four-fold has also been observed. Are varieties, then, to be considered as being intravolutionarily included within the nature of the species? But, in that case, how is the nature of the plant to be considered? The least common multiple of two, three and four is twelve. Is the Fuchsia to be considered in some way as of a duodecimal nature? And are the many others, in which the five-fold arrangement appears—in sepals, petals, etc.—as of a decimal nature? And is there a common universal plant nature, characterised by the least common multiple, the factors of which are continually recurring in the numerical arrangements of the specimens observed by botanists? If such a view can be established and help in elucidating problems of classification, etc., it might be known as a theory of intravolution, rather than of evolution. For the appearance of a variety, which is such a stumbling block to the theory of evolution, would be seen then to be the outcropping of an element or factor in the nature, which previously had remained latent. I offer the suggestion quite tentatively. Perhaps others, besides myself, may at least be interested in the facts of variability as regards Fuchsias, established by your correspondents. They certainly do not seem to me explainable along the line of the accepted theory of evolution, whatever the true explanation of them may be. *E. Judson Sage, A.R.C.Sc., Exeter.*

Potentilla fruticosa.—Mention of the pretty little Potentilla nitida in *Gard. Chron.*, June 14, p. 292, suggests a shrubby member of the genus which is worth more attention than it usually receives. This is Potentilla fruticosa, a small-growing shrub of wide geographical distribution throughout the northern hemisphere both in the old and new worlds. It occurs in the north of England and in Ireland. This Potentilla forms a somewhat upright-growing bush, usually from two to four feet in height. The leaves, which are pinnate in shape, are markedly hoary underneath. The flowers are fully one inch across, and in some cases more. Of a rich yellow colour, their value is chiefly from an ornamental standpoint, and is greatly enhanced by the fact that they are borne from July until early autumn, when few flowering shrubs are at their best. This Potentilla in its varied forms is not particular as to soil. It will flourish even in comparatively dry, warm situations. As may be expected of a plant which is so widely distributed, there are several well-marked varieties, which differ from the type and from each other. One particularly striking form is Veitchii, which has been by some regarded as a distinct species. It was sent home by Wilson from Hupeh, China, when he was travelling there on behalf of Messrs. James Veitch and Sons. The leaves of this plant are hoary, while the comparatively large flowers are pure white. Other varieties include grandiflora, with large flowers; ochroleuca, pale yellow; and Vilmoriniana, resembling a creamy-coloured form of Veitchii. *W. T.*

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 17.—A comparatively small exhibition was provided for the Fellows and others who attended the R.H.S. meeting at Westminster on Tuesday last, and the attendance, like the display, was small. The most prominent features were Paeonies, Irises, Flowering Shrubs and Orchids. The Floral Committee's awards consisted of nine medals and five awards of merit; the Fruit and Vegetable Committee made no awards; the Orchid Committee recommended four awards of merit to novelties and awarded two medals to groups.

Floral Committee.

Present: Messrs. H. B. May (in the chair), John Green, J. W. Barr, Sydney Morris, G. Reuthe, John Heal, J. W. Moorman, A. Ireland, Thos. Stevenson, W. Howe, C. Dixon, Chas. E. Pearson, W. P. Thomson, Jas. Hudson, E. H. Jenkins, H. R. Darlington, J. F. McLeod, C. R. Fielder, A. G. Jackman, R. C. Notcutt and E. A. Bowles.

NOVELTIES.

AWARDS OF MERIT.

Cheiranthus Pamela Pershouse.—A perennial Wallflower obtained by crossing Cheiranthus alpinus with C. Allionii. The rich yellow flowers are large and freely produced in long spikes. The blooms shown on this occasion were not so fine as those exhibited on May 27 (see R.H.S. report, May 31, p. 272). Shown by Mr. E. MARSDEN JONES, Tilston, Malpas.

Cistus Silver Pink.—A pretty and free flowering shrub which carries large numbers of bright pink flowers. The leaves are thick, broadly lanceolate, one to three inches long, deep green above and grey green beneath; they are opposite and closely set on the grey stems. C. Silver Pink is a choice seedling and probably a hybrid between C. villosus and C. cyprius. Shown by Messrs. HILLIER AND SONS, Winchester.

Paeonia Lord Cavan.—A strong growing single variety with broad petals that make up a flower of large size. The colour is violet rose, with a large central mass of narrow petaloid stamens, which are violet-rose coloured, with pale yellow margins, and a creamy under surface. Shown by Messrs. J. KELWAY AND SON.

Lonicera ciliosa.—A handsome Honeysuckle with clusters of elongated orange scarlet flowers, yellow on the inside. The two upper leaves are united at the base around the stem. Shown by Lady GURNEY.

Sweet Pea Royal Scot.—This showy variety bears large and regularly placed flowers. The colour is rich salmon cerise, with a little touch of purple at the bases of the segments, and a light shading of this colour on the pale keel. Shown by Messrs. DOBBIE AND Co.

GROUPS.

A very large group exhibited by Messrs. KELWAY AND SON filled almost the whole of the tabling along one side of the hall. Paeonies were the chief feature, but Delphiniums occupied a central position. The large-petalled single Paeonies, with their big bosses of yellow stamens, were particularly attractive, and notable varieties of this section were British Empire, rose red; Lena Ashwell, rosy crimson; Victoria, pink; Millais, crimson-scarlet; Queen Alexandra, white; and Sea Shell, pale pink. The Delphiniums were scarcely at their best. (Silver-gilt Banksian Medal.)

Paeonies and Delphiniums, with golden Spanish Irises, were grouped effectively by Messrs. R. H. BATH. Delphiniums Moerheimii, Humboldt, Lamartine, and Mrs. Creighton were good. Very many of the Paeonies were charming seedlings, shown under numbers only (Silver Flora Medal).

The bearded Irises shown by Messrs. R. WALLACE AND Co. were very bright, but the spikes showed the effects of the recent hot weather. The dwarf, free flowering, rich purple Tomtit (see Fig. 154); Marsh Mallow, gold and crimson; Blue Lagoon, light and dark blue; Rodney, soft blue, free; and Knysna, deep yellow and crimson, were all shown well (Silver Banksian Medal). Mr. G. REUTHE exhibited Paeonies as a background for numerous choice and interesting plants, such as Halesia tetraptera, Roscoea cautiloides, Allium pedemontanum, Aciphylla squarrosa, in bloom; Crinodendron Hookeri, Magnolia Soulangeana nigra, and a flowering specimen of Beschorneria yuccoides, with a yard high pink-stemmed spike furnished with large pink bracts (Silver Banksian Medal).

In the group of Roses contributed by the Rev. J. H. PEMBERTON, the new pillar variety Star of Persia, semi-double, occasionally single, and deep golden yellow, was the outstanding variety. It has neat foliage, is free flowering, and scented—but by no means pleasantly. Pax, Miriam and Moonlight were other varieties in the group (Silver Flora Medal). A handsome group of Roses, arranged by Mr. ELISHA HICKS, included fine sheaves of bloom of Rosa Moyesii, Cupid, Trier, the lovely White Una, Léontine Gervais, Princess Mary, and Joanna Bridge (Silver Gilt Banksian Medal).

A delightful little exhibit of Carnations from Messrs. ALLWOOD BROTHERS included clean flowers of Triumph, Mary Allwood, May Day, White Wonder and Beacon (Bronze Flora Medal). Standard Fuchsias and Heliotropes, with dwarf Pelargoniums, Hydrangeas and Verbenas were grouped with palms and ferns by Messrs. H. B. MAY AND SONS (Silver Flora Medal).

Early flowers of Star Dahlias made a bright patch of colour in Messrs. J. CHEAL AND SONS' group, but the shrubs were even more interesting, especially the flowering branches of Olearia Gunniana, Kalmia angustifolia, the beautiful Leptospermum scoparium var. Boscawenii, Lonicera flava nana, Robinia hispida, and Philadelphus Bouquet Blanc (Silver Banksian Medal). Messrs. HILLIER AND SONS exhibited flowering branches of Solanum crispum, Lonicera tragophylla, Rosa Moyesii and Lavatera Olbia. Miss WILLMOTT sent large branches of Pyracantha crenulata var. Warley, clothed in small, cream white flowers; Paeonia Woodwardii, pink; Deutzia longifolia var. Warley, with large rosy-pink blooms; and Helichrysum frigidum, a dwarf, grey-leaved and white-flowered alpine.

Mr. C. ELLIOTT massed Nepeta Mussinii with Lychnis viscaria splendens plena, and showed a few interesting alpines. Mr. G. W. MILLER sent a few Pinks, and Messrs. PIPERS showed the elegant Silene Armeria pallida, the bright Pentstemon isophylla, and Dianthus Napoleon III.

FIG. 154.—IRIS TOMTIT: COLOUR, RICH PURPLE.

Orchid Committee.

PRESENT: Sir Jeremiah Colman, Bart. (in the Chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. Secretary), W. Bolton, Arthur Dye, Frederick J. Hanbury, W. H. White, C. J. Lucas, Fred Sander, W. J. Kaye, S. W. Flory, T. Armstrong, Chas. H. Curtis, Walter Cobb, Richard G. Thwaites, Pantia Ralli, and R. A. Rolfe.

AWARDS OF MERIT.

Odontioda West Point Beauty var. Exquisita (*Oda. Bradshawiae* × *Odm. eximium*) from Sir JEREMIAH COLMAN, Bart., Gatton Park (gr., Mr. J. Collier). A very richly-coloured hybrid of large size, and still retaining the bright red of Cochlioda Noezliana, but deepened in tint. Colour deep red, with blush white markings on the tips of the petals and front of the lip.

Odontoglossum Miguelito (*Dora* × *Doris*) from Dr. MIGUEL LACROZE, Bryndir, Roehampton (Orchid grower, Miss Robertson). A fine form, which had previously secured a Preliminary Commendation when shown with its first flower.

The flowers on the plant now shown were large and of perfect form. The colour is bright claret red, with whitish markings at the tips and bases of the sepals and petals. The lip is well developed—blush white in front, blotched claret red at the base; crest yellow.

Sobralia Lyoth (*macrantha* × *Charlesworthii*) from Messrs. CHARLESWORTH AND Co., Haywards Heath. A great improvement on the S. Charlesworthii, although the latter in its dwarf habit and richly-coloured flowers is a distinct advance on its ally S. Ruckeri. The flowers are bright rosy mauve, the lip deep reddish crimson, with yellow base.

Laelio-Cattleya San Juan var. Victory (*C. Mendelii* × *L.-C. Aphrodite*) from Mr. C. F. WATERS, Deanlands Nursery, Balcombe. The flowers are large and showy, adhering most nearly to the Laelio-Cattleya parent, but of firmer substance. The sepals and petals are white tinged with lavender blue; the lip broad, of deep purple color, with yellow base.

PRELIMINARY COMMENDATION.

To *Odontoglossum Fabia* (*eximium* × *Aglaon majesticum*) from C. J. LUCAS, Esq., Warnham Court, Horsham. A perfect flower, of large size, white, with groups of violet blotches on the inner parts of the segments, and a surrounding band of violet markings on each.

CULTURAL COMMENDATION.

To Mr. J. COLLIER, gr. to Sir Jeremiah Colman, Bart., for a fine plant of the Philippine Dendrobium acuminatum, with five strong spikes of pink and red flowers.

To Mr. THURGOOD, gr. to H. T. Pitt, Esq., for a very fine plant of the curious Bulbophyllum Balfourianum, with fourteen large fleshy flowers closely arranged on three short spikes. The ground colour is cream white, densely spotted with purple.

OTHER EXHIBITS.

Sir JEREMIAH COLMAN, Bart. (gr. Mr. Collier), staged a fine selection of rare Orchids, including three specimens of Dendrobium Dalhousieanum luteum; the handsome D. illustre Florence Bartels, for which he had previously received an Award of Merit; the rich violet Odontoglossum Gatton Emperor; and Dendrobium acuminatum, with five spikes.

Messrs. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver Flora Medal for a group of Miltonias, Odontoglossums, and other hybrids. A very interesting exhibit was the new Charlesworthеara Alpha (Miltonioda Ajax × Oncidioda Cooksonia), with flowers uniformly orange scarlet. It was recommended to the Scientific Committee for a Certificate of Appreciation. Other novelties noted were Odontioda Hilda (Odm. Dora × Oda. Royal Gem), with showy flowers and promising Odontoglossum seedlings.

Messrs. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group in which the best plants were Odontioda Bradshawiae Cookson's variety, fine in shape and bright in colour; Oda. Thwaitesii, Oda. Diana, and some good Laelio-Cattleyas, the best being L.-C. Isabel Sander, with white sepals and petals veined with purple and deep purple lip.

Messrs. FLORY AND BLACK, Slough, showed a selection of hybrid Odontoglossums and other Orchids. The best was the new Brasso-Cattleya grandis (B.-C. Thorntonii × C. Mendelii), with large blush white flowers, with yellow disc to the lip, which has a few purple markings in front; and the profusely-flowering Sophro-Laelio-Cattleya Nerissa.

OTTO BEIT, Esq., Tewin Water, Welwyn, Herts (gr. Mr. H. Lloyd), sent the brightly-coloured Vuylstekeara Thera var. Tewin, with an elegant branched spike of dark scarlet flowers with blush white front to the lip. It was raised between Miltonia Warscewiczii and Odontioda Cooksoniae.

Fruit and Vegetable Committee.

Present: Messrs. W. Poupart (in the chair), O. Thomas, W. Bates, E. Beckett, J. C. Allgrove, A. R. Allan, H. Markham, F. Jordan, A. Bullock, W. J. Jefferies, F. Perkins, G. P. Berry, W. H. Divers, H. S. Rivers, G. F. Tinley, and Rev. W. Wilks.

FIG. 155.—MESSRS. DOBBIE AND CO.'S EXHIBIT AT THE PARIS EXHIBITION.

The only exhibit submitted for award was a new Strawberry named Crimson Beauty. It was exhibited by John Chivers, Esq., Wyctfield, Cambridge (gr. Mr. F. J. Sage), who described it as a seedling, mid-season variety of strong, vigorous habit and mildew-proof. The Committee recommended the variety be sent for trial at the Wisley Gardens.

Mr. EDWIN BECKETT brought two fruits of a small, unnamed Melon for the Committee's inspection. The fruits were of small size, about 6 or 8 inches long and elongated somewhat like the shape of a small Marrow. The flavour was considered very fair and, as the fruits come to maturity quickly, it would possibly be a useful addition to existing varieties.

Mr. S. T. WRIGHT showed specimens of the June Bug referred to by Mr. Divers on p. 308. Mr. Wright stated that the pest was doing enormous damage in the gardens and was especially troublesome to the Apple trees. It had spread to gardens and farms all round the neighbourhood of Wisley, and was even attacking the Wheat in some places.

SOCIETIE NATIONALE D'HORTICULTURE DE FRANCE.

JUNE 5-9.—The very interesting and creditable exhibition organised by the above Society at Cours-la-Reine on the dates given was the first show—worthy of that name—to be held in Paris since the exhibition of 1914. It really attained, in spite of adverse circumstances, to a degree of equality with pre-war shows.

In spite of the numerous losses due to the war, all the usual exhibitors were present, glad to meet again after the last terrible five years, and to feast their eyes on the beautiful fruit trees of NOMBLOT, the Rhododendrons of CROUX, the Roses of NONIN, the Begonias of VALLERAND, the Orchids of MARON and of VACHEROT, the vegetables of VILMORIN, and all the other horticultural products grown with such loving skill, and arranged with all the grace native to the country. We may also mention an interesting exhibition of "indoor" rock gardens—pretty little boulders, small enough to carry about, decorated with dwarf Campanulas, Saxifrages, Sempervivums and young Ferns.

The Sweet Peas brought from Edinburgh by DOBBIE & Co. made a fine display (see Fig. 155). The flowers stood the long journey well, and looked as fresh as if they had been grown in France. The more delicate shades, such as Mrs. A. Hitchcock, Mrs. Tom Jones, and Old Rose appealed most to the Parisian taste. The exhibit covered a space of over 150 square feet. Another notable exhibit was that of the Orleans Railway Company, who staged an excellent collection of fruits and vegetables grown in the districts served by the railway.

Among new or interesting plants, we may mention a few, including some new Hydrangeas shown by M. MOUILLIERE—Maréchal Foch, a beautiful bright rose shade (Certificate of Merit); Paris 1919, with large pink festooned petals (Certificate of Merit). Then there were some very beautiful seedlings from M. CAYEUX, Head Gardener of the town of Havre, including Madeleine le Clerc (Cert. Merit), Suzanne Cayeux (Cert. Merit), and Beauté Hâvraise (Cert. Merit), all three of a lovely shade of pink. New Rex Begonias were shown by M. CHANTRIER, including Le Resplendimant (Cert. Merit), Mme. Chantrier Mère (Cert. Merit), Maréchal Foch, La Perle de Mortefontaine with pink petals, and others. Roses were excellently shown by M. NONIN, including Paul's Scarlet Climber (said to be a hybrid of Wichuraiana, with flowers of an attractive red something like those of Rosa Moyesii), Louise Crète (a pure white flower, very like the celebrated Frau Karl Druschki), Château de Clos Vougeot (a curious vivid red), and Joseph Guy (a large-flowered Polyantha Rose, said to be very free-flowering, and the petals firmly attached). It received a Certificate at Bagatelle in 1918. From Monsieur VALLERAND came a very fine tuberous Begonia with deep red flowers, called Verdun (Certificate of Merit). Monsieur MARON showed one of the best varieties of the series of Iris Ricardii obtained by M. DENIS, at Balaruc, named Madame Durrand. The flowers are very large, but the colour is, unfortunately, a little dull. Messieurs VILMORIN, ANDRIEUX & CIE showed specimens of their new varieties of Iris germanica, including Magnifica, Opéra, Ambassador, Eldorado, Grévin, Ambigü and Ballerine. They also showed a dazzling display of annuals, the colour scheme representing the tri-colour of France. Altogether the exhibit was a very fine one, and covered a space of about 1,000 square feet. Messieurs CAYEUX & LE CLERC showed a number of pretty varieties of Paeonies with single flowers, such as Akaku, Cendrillon, Scioba and Rinokino. The exhibit of MM. CROUX ET FILS consisted chiefly of a fine series of Rhododendrons, not named; and the celebrated firm of MARON showed Orchids in fine display, including some new Odontioda hybrids.

Among the exhibits of the Orleans Railway Co. were noticed some baskets of Strawberry Alphonse XIII., which was raised some time ago by VILMORIN, ANDRIEUX & Co. It is now extensively cultivated in the Orleans district, and is the variety chiefly grown for export to England. The great "Prix d'Honneur," given by the President of the Republic, was accorded to the last-mentioned firm.

As was the custom before the war, the holding of the Annual Horticultural Congress coincided with the date of the exhibition. Many topical questions were discussed, notably that of the restoration, from the horticultural point of view, of the regions devastated by the war. The subject of horticultural labour was also considered, and the future part which the horticultural societies should play. Last, but not least, the important question came up, how to obtain for the raiser the benefit of the new plants he obtains. This was the subject of an interesting paper read by M. Ducomet, of the Rennes National Agricultural College. It was followed by an interesting discussion, in which MM. LEMOINE (Nancy), RIVOIRE (Lyons), and CAYEUX (Paris) took part.

The weather was very fine during the whole period of the exhibition; indeed, on some of the days it was exceedingly warm, the thermometer registering over 90° in the shade. The usual large tent was not employed, but for the principal exhibits a wooden structure was provided, with a roof of white canvas, which was very much more suitable, and might with advantage be adopted at other similar exhibitions. The show was opened by the President of the Republic, and there were many notable visitors, including Marshal Foch and Mr. Lloyd George.

ROYAL HORTICULTURAL AND ARBORICULTURAL OF IRELAND.

JUNE 11, 12.—A successful show was held by the above society, in conjunction with the Royal Dublin Society's Agricultural Summer Exhibition, Ballsbridge, Dublin, on the 11th and 12th inst. The somewhat belated issue of the schedule, combined with transit and labour troubles, confined entries to narrow limits, but a few classes for large groups, in which liberal prizes were offered brought a good response and added considerably to the very interesting function of the Royal Dublin Society. In the Open Champion class for a group of foliage, flowering, and decorative plants and cut blooms, staged on a space of 400 square feet, prizes of £15, £10 and £5 were offered. There were three competitors, and the awards were made in the following order:—1st, Messrs. CHAS. RAMSAY AND SON, Royal Nurseries, Ballsbridge; 2nd, the DONARD NURSERY Co., Newcastle, Co. Down; and 3rd, B. H. BARTON, Esq., D.L., Straffan, Co. Kildare (gardener, Mr. F. Streeter). In a similar class for a group staged on a space of 200 square feet, traders excluded, the first prize was won by Mrs. STEPHENSON, Cranford, Dublin; 2nd, Major KELLY, Montrose, Donnybrook. Prizes were offered for flowering and ornamental shrubs and trees, shown as cut sprays or plants, on a space of 150 sq. ft., but only one entry was forthcoming, for which the second prize was awarded. In a similar class, staged on a space of 75 sq. ft., Capt. RIALL, D.L., Old Conna, Bray (gardener, Mr. T. Webster), was awarded the first prize; Mrs. STEPHENSON was a close second. Following the groups came classes for collections, in which the outstanding feature was a collection of hardy flowers shown on a space 20 x 4 ft., in which Messrs. WM. WATSON, LTD., Clontarf Nurseries, and Killiney Nurseries, made a brilliant display. Apparently it was too early for Sweet Peas and Roses, although the class for a collection of the first-named flowers, staged on a space 12 x 3 ft., resulted in a fine exhibit from Viscount POWERSCOURT'S gardens (gardener, Mr. W. H. Lee); 2nd, Miss OSBORNE. Mr. E. D'OLIER showed the best Roses, and was placed 1st in the class for 24 blooms. Mr. S. A. JONES, nurseryman, Kilkenny, showed excellent Pansies, for which he was awarded 1st prize; and he also showed an interesting exhibit of Violas not for competition. In the Viola class Mr. ED. KELLY, Kingstown, and Canon KINGSMILL MOORE, D.D., were placed first and second respectively, and Canon KINGSMILL MOORE had a fine exhibit of British Ferns, gaining the first prize.

Vegetables were well shown, especially by Viscount POWERSCOURT, who won in the champion class for a collection staged on a space 12 x 4 ft., with produce of outstanding merit. Single dishes displayed good quality generally. Messrs. BAKERS, Wolverhampton, showed alpines and hardy flowers, for which a silver medal was awarded. A silver medal was also awarded to a group of foliage and flowering plants from Trinity College Botanic Gardens, Dublin, set up by Mr. S. G. WILD, who succeeded the late Mr. F. W. Burbidge in charge of these noted gardens. Messrs. ALEX. DICKSON AND SONS, Newtownards, were awarded a Gold Medal for Sweet Peas. Messrs. HOGG AND ROBERTSON, Dublin, and Rush, Co. Dublin, set up a magnificent exhibit of Spanish Irises, which provided a feature of the show, and received a Gold Medal. A Silver Medal was awarded to Messrs. CHAS. RAMSAY AND SON, for a table of decorative plants and floral designs.

GRAND YORKSHIRE GALA.

JUNE 18, 19 AND 20.—After a break in its long series of shows, due to the war, the Council of the Grand Yorkshire Flower Show and Gala resumed business in Bootham Park, York, on the above dates, and held its 57th Show. Many circumstances combined to make a resumption of the Show a very difficult matter but these were all overcome in a greater or less degree, with the result that although the exhibition was by no means so extensive as so many the present reporter has seen during a period of twenty-one years previous to the war, it was unquestionably a fine display. The trade groups were excellent, and both the gala authorities and the trade are to be congratulated upon their mutual enterprise in face of great labour and transport difficulties. Hardy flowers, ever a great feature at York, were exceptionally good, and the Roses were far ahead of the displays of some previous years, though perhaps a trifle behind the very best we have seen in this ancient and walled city.

The Gala Council suffered many disappointments after they agreed to resume operations, and the worst of these was the wholesale requests from exhibitors, a month before the Show, to be excused. However, energy and initiative won through, and even at the last moment, when railway difficulties rendered it impossible for some thirty exhibitors to bring their goods to York, the Council turned to account what would otherwise have been vacant space by turning one tent into a suitably-floored dancing hall, and another into a place for holding cinema entertainments. Of course, the usual outside attractions were present, including a large pleasure fair.

Notably absent features were the huge trained Pelargoniums, for which York is famous, as in few other places have these been seen during recent times. The large groups arranged for effect, the giant specimen stove and greenhouse plants, and the many fine competitive exhibits of fruits and vegetables that were a source of wonder and delight to thousands, were wanting on this occasion. Nevertheless it was a great Show, and an entirely new feature was provided by the educational exhibits sent by the Royal Horticultural Society, the Board of Agriculture, and the garden designs from Messrs. J. Cheal and Sons and Messrs Milner, Son and White.

Major Dent, the President; Sir J. Sykes Rymer, Treasurer; Mr. H. W. Pulleyn, the new Secretary; and Mr. T. E. Hodgson, Chairman of the Floral Committee, and all the other officers, are to be congratulated upon the success which attended their almost superhuman efforts on behalf of horticulture in the northern province.

Orchids.

The premier award for a dozen Orchids was won by Messrs. J. CYPHER AND SONS, Cheltenham, who showed admirable examples of Thunia Magoniana with eight spikes; Cypripedium niveum, Cattleya gigas Sanderiana with six grand flowers, C. Whitei, Cypripedium Lawrenceanum, Laelio-Cattleya Fascinator with ten blooms, and Masdevallia Harryana.

Messrs. J. CYPHER AND SONS were also first for six Orchids, and here they showed good examples of Thunia Magoniana, Laelio-Cattleya Fascinator splendens, L.-C. Aphrodite, Cattleya gigas, Laelic Pacavia and Brasso-Cattleya Cliftonii. Mr. JAS. SUNLEY second with small specimens. The same firm also excelled for three Orchids, with a blotched Odontoglossum crispum, Laelio-Cattleya Aphrodite, and L.-C. Canhamiana. Mr. JAS. SUNLEY, Wighill, Tadcaster, second. For a specimen Orchid Messrs. J. CYPHER AND SONS were placed first, with the lovely white Cattleya Queen Mary.

Mr. JAS. HARTLEY, The Knowle, Morley, led in the amateur class for half a dozen Orchids, and his Miltonia Bleuana aurea and Odontoglossum Vulturia were his best specimens; Mr. J. SUNLEY, second. Mr. HARTLEY was first, and Mr. SUNLEY second, for three Orchids.

Roses.

Three competitors came forward in the large class for seventy-two Roses in not fewer than thirty-six varieties, and Messrs. D. PRIOR, Colchester, won first prize with a series of very fresh, clean and good-sized blooms, among which the varieties J. B. Clarke, Mildred Grant, Mélanie Soupert, Mme. Jules Gravereaux, Bessie Brown, Nita Weldon, Capt. Hayward, and Mrs. Dudley Cross were particularly good. Mr. ELISHA HICKS, Twyford, was second, and Messrs. JARMAN AND CO., Chard, third.

Messrs. D. PRIOR AND SON led in the class for forty-eight Roses in not fewer than two dozen varieties, and in their stand they had fine examples of J. B. Clarke and Souv. de Pierre Notting; Mr. ELISHA HICKS second. In the class for thirty-six Roses in not fewer than eighteen varieties Messrs. PRIOR AND SON and Messrs. JARMAN AND CO. were the first and second respectively, with Mr. ELISHA HICKS third. Messrs. PRIOR'S Roses were again to the front in the class for twenty-four distinct varieties; Mr. ELISHA HICKS came second. For eighteen Roses, distinct, it was the same story.—Messrs. PRIOR first and Mr. E. HICKS second.

In an amateurs' class for eighteen Roses the Misses F. and S. SPICER, Rack Close, Chard, were first, and Mr. R. PARK, Aiskew, Bedale, second; while Mr. G. W. READER, Naburn Ferry, York, led for twelve Roses, with Mr. R. PARK second.

Mr. ELISHA HICKS was first prize-winner for a group of Roses, but his pillars of bloom were too formal to make the display a good one. Mr. W. LANGSTAFFE, Garth Terrace, York, was awarded a second prize for a group of Roses in pots.

Groups and Plants.

In the principal class for a group of miscellaneous plants arranged for effect—a class which has on other occasions provided the great feature of a York Gala—there were but two exhibitors. Mr. W. A. HOLMES, Chesterfield, was awarded first prize for a handsome arrangement that consisted very largely of Codiaeums, Alocasias, Marantas, Dracaenas, Palms, and Ferns, with a few Orchids and Clarkias. The general arrangement, with a wide central arch, was quite good, but it was practically a group of ornamental foliaged plants. Messrs. R. SIMPSON & SON, Selby, second with a poor display of Schizanthus, Marguerites, Coleus, Pelargoniums, and foliage plants.

For the best collection of flowering and foliage plants arranged effectively on a semi-circular space 10 ft. by 6 ft. Messrs. J. CYPHER & SONS secured first prize, with a charming group of Orchids, Anthuriums, Crotons, and Aralias, put up with their usual taste. Mr. W. A. HOLMES was awarded second prize for a group in which bright Crotons figured largely. Mr. T. M. PETCH, Bridlington, came third with a bright but rather crowded exhibit of Carnations, Sweet Peas, Statice, Astilbes, Hydrangeas, and Standard Roses. There were five competitors in this class.

Mr. W. ATKINSON, Middlethorpe Lodge Gardens, Dringhouses, York, contributed a group of Carnations in pots, and was awarded first prize. It was a rather dense group of perpetual and Malmaison varieties, and there was an abundance of bloom. Mr. W. LANGSTAFFE second. A second prize was awarded Mr. PETCH for a group of bedding plants in a class that might prove interesting in future years.

Messrs. C. E. SIMPSON, LTD., Spurrier Gate, York, were awarded first prize for the only group of Calceolarias staged; they showed bedding varieties around a central massing of C. Clibranii. Dr. MACDONALD, Ouse Lea, York, showed a fine set of eight well-grown herbaceous Calceolarias, and was deservedly awarded a first prize.

Hardy Flowers.

Hardy flowers were exhibited largely and in fine style, as is always the case at York.

For two dozen bunches of hardy flowers Messrs. GEO. LONGSTER AND SONS, Malton, secured first prize with boldly and legibly-labelled vases of Inula grandulosa, Geum Mrs. Bradshaw, Nepeta Mussinii, Erigeron B. Ladhams, Achillea serrata grandiflora, and Verbascum Caledonia, with Lupins, Irises, Paeonies and Pyrethrums; Messrs. HARKNESS AND SON, Bedale, were a close second, and they showed Papaver Mrs. Perry, P. Perry's White, and P. Sir Douglas Haig (clear scarlet), in fine condition.

The glorious group of cut hardy flowers which won a first prize for Messrs. HARKNESS AND SON was fine alike in quality and effect, and consequently was greatly admired. It contained

great sheaves of the Oriental Poppies Joyce, Nancy, Perry's White, Oriflamme, Mrs. Perry, Sir Douglas Haig, and Oriental King, with Pyrethrums in variety, Anchusas, Liliums, Verbascums, and Lupins, but the Poppies were the outstanding feature of a first-rate group.

Two large pear-shaped groups of hardy herbaceous perennials, cut flowers, created a fine effect. Each competitor was allowed a space not exceeding 350 sq. feet, and was requested to produce a natural effect thereon. Messrs. W. ARTINDALE AND SON, Sheffield, were awarded the £15 first prize for a display that was very effective but lacked something in "finish." Verbascums, Delphiniums, Erigerons, Campanulas, Liliums, Astilbes, Tritomas, Pyrethrums, and Paeonies, were capitally shown. Messrs. HARKNESS AND SON, Bedale, filled their space with Lupins of the polyphyllus type, a harmonious blend of various shades of blue, rose, pink, and cream, with a low margin of Oriental Poppies. The margin was the weakest part of a novel and bold exhibit.

Sweet Peas and Other Classes.

Messrs. E. W. KING AND CO., Coggeshall, led in the class for a group of Sweet Peas, their more artistic arrangements helping them to score over Messrs. BIDE AND SON, Farnham, who were placed second. Gladys, pale lavender blue, and Doris, light salmon cerise, were two good new varieties in Messrs. KING's display, while Gladys Bide and Victory were conspicuous in Messrs. BIDE's stand.

Mr. E. HICKS showed the best epergne of flowers, and won with a dainty arrangement of Irish Elegance Roses; Mrs. JEFFERSON, Acaster Malbis, York, second; and Mr. T. M. PETCH, third, each with Sweet Peas.

Educational Exhibits.

The Royal Horticultural Society filled a large space with their Food Production Exhibit, as they were allowed ample room for setting out the charts of food-values; nozzles and diagrams showing the density and spread of spray fluids; cases showing the life histories of insect pests, grouped according to the kind of fruit or group of vegetables on which the pests prey; diagrams of pruning, budding, and grafting; models of digging and trenching; a set of the Society's medals; Haricot Beans and notes of their productiveness; photographs showing the effects of Eelworm disease in Daffodils and methods of treatment; and photographs of the Wisley Laboratory and Gardens. Messrs. SUTTON AND SONS lent their interesting series of models of vegetables, and Mr. V. Banks, representing the Food Preserving section of the Board of Agriculture, put up about 200 bottles of fruits and vegetables. The whole of this educational display proved greatly interesting to visitors, and enhanced the reputations of the R.H.S. and the Board of Agriculture. Messrs. J. CHEAL AND SONS, Crawley, and Messrs. MILNER, SON AND WHITE, Westminster, exhibited plans of gardens showing a great variety of designs.

Trade Exhibits.

A large and elegantly arranged group of perpetual Carnations from Messrs. ALLWOOD BROTHEXS, Wivelsfield, attracted a great deal of attention. The disposition of the flowers in vases of various heights and in hanging baskets was good. The varieties Lady Meyer, Wivelsfield Beauty, Wivelsfield White, Destiny, Triumph, Beacon, and Mary Allwood were handsomely represented. Mr. C. H. TAUDEVIN, Willaston, showed Carnations and Paeonies, arranged over a groundwork of green moss. Kenneth, Saffron, Enchantress, Robin Clover (yellow ground fancy, a robust eedling from Sunstar), Lady Northcliffe, and Peerless were the leading varieties of Carnations. Messrs. STUART LOW AND CO., Enfield, were exhibitors of Carnations, and their best blooms were of Triumph, Beacon, Saffron, and White Enchantress.

Messrs. MANSELL AND HATCHER, Rawdon, set up a charming group of Orchids, in which every plant was seen to full advantage in a setting of moss and ferns. The centre piece was a fine specimen of Coelogyne pandurata; in front was a colony of Cypripedium niveum, and on either side and at the back were Miltonias and forms of Laelio-Cattleya Fascinator. This part of the group was flanked by high mounds of Miltonias with handsome Odontoglossum spikes rising therefrom. The white Cattleya Holdenii was a notable plant in this group.

Messrs. JAS. BACKHOUSE AND SON, LTD., York, had a grouping of Carnations, blue Hydrangeas, Astilbes, Lilium candidum, Sweet Peas in pots and a capital assortment of elegant foliaged plants. Messrs. BACKHOUSE had also a rock garden exhibit with a little moraine. This was a daintily-gay arrangement, wherein Primulas, Dianthuses, Saxifrages, Mimulus Brilliant, Edelweiss, Veronicas and small ferns nestled between the grey stones in front of a background of Pines.

Messrs. S. BROADHEAD AND SON, Thongsbridge, Huddersfield, arranged a rock garden on a very solid wooden staging. The Yorkshire stone was most naturally disposed, and little Pines were used as a background. In such a narrow arrangement it was only possible to use dwarf plants, and these, such as Sedums, Veronicas, Thymus, Dianthus, Linaria, Campanula, and Cistus were grouped in pretty little colonies. Some small plants of Juniperus communis aurea were delightful, and so was a group of Sempervivum Moggridgei.

A fairly large rock garden was arranged by Messrs. KENT AND BRYDON, Darlington, and here the natural grey stone was used artistically, and a background cf Pines and Japanese Maples was provided. There were delightful groupings of Saxifraga cochlearis minor, Hieracium villosum, Aster alpinus albus, Campanula Miss Willmott, Allium pedemontanum, Linum arboreum, Erigeron Asa Gray, and Hypericum gracile. The same firm contributed a water garden, with Irises and Liliums around a Waterlily pool.

Very interesting was the group of hybrid and cross-bred Irises and Hemerocallis shown by Mr. GEORGE YELD, Burton Lane, York, who is continuing the work he began at least a score of years ago. Irises Sunshine, Asia, Lord of June, and Neptune, all of which have received the R.H.S. Award of Merit, were shown in superb condition, as also were Hemerocallis Corona, Darius, Miranda, Melissa, and Marigold. H. Melissa, with its faint orange flushing on a gold ground, is very fine in form and colour. A beautiful semi-circular group of Kalmia latifolia, grandly flowered, was contributed by Messrs. JOHN WATERER, SONS AND CRISP, Bagshot. Very rarely, if ever, have such finely flowered specimens, and in such quantity, been seen at a flower show.

Messrs. G. GIBSON & SON, Leeming Bar, were represented by a large bank of cut hardy flowers; the arrangement was good, but rather formal, and the group included Paeonies, Poppies, Irises, and other popular subjects in great variety. Mr. E. J. PARSONS, Wocester, staged Canterbury Bells in fine form, with Roses and large specimens of Nephrolepis. Messrs. C. E. SIMPSON, LTD., York, filled a large table with seasonable fruits and decorated it with a large variety of cut flowers.

The beautiful Pyrethrum, Queen Mary, was a conspicuous feature in the group of hardy flowers shown by Mr. G. W. MILLER, Wisbech; other good things were Erigeron B. Ladhams, Pink Gladys Cranfield, Campanula Miss Willmott, Sidalcea Rosy Gem, Paeonies, Irises, and a series of Heucheras.

AWARDS TO NON-COMPETITIVE EXHIBITS.

President's Prize for best exhibit in the Show.—To Messrs. ALLWOOD BROTHERS.

Large Gold Medal.—To Messrs. ALLWOOD BROTHERS, Messrs. MANSELL AND HATCHER, Messrs. KENT AND BRYDON, Messrs. I. CHEAL AND SONS (for garden designs), and Messrs. MILNER, SON AND WHITE (for garden designs).

Gold Medal.—To Messrs. JAS. BACKHOUSE AND SON, LTD.; Messrs. S. BROADHEAD AND SONS, LTD.; Mr. G. W. MILLER; Mr. CHAS. E. SIMPSON; Messrs. STUART LOW AND CO.; Mr. C. H. TAUDEVIN; Messrs. JOHN WATERER, SONS AND CRISP; and Mr. GEORGE YELD (for hybrid Iris and Hemerocallis).

Silver-Gilt Medal.—To Messrs. G. GIBSON AND CO.; and Messrs. G. and W. BURCH.

Silver Medal.—To Messrs. PADGETT AND WATSON; and Mr. E. J. PARSONS.

Special Certificate of Merit.—To the Royal Horticultural Society for an educational horticultural exhibit; and to the Board of Agriculture for bottled and dried fruits and vegetables.

CROPS AND STOCK ON THE HOME FARM.

THE DROUGHT.

IN the South of England we are experiencing an unprecedented spell of dry weather at a very critical period of the year, and this is likely to have a damaging effect on the various crops. During the month of May only 0.66 inch of rain was registered, and but 0.07 during the present month. Couple this absence of rain with hot sun and parching winds, and the result to many crops can easily be imagined. In the month of April we had only 2.59 inches of rain. Spring-sown Oats in land well cultivated are looking wonderfully well in colour, but exceptionally short in the straw. The winter-sown varieties are heading well, but are very short. Barley, where sown early in good ground, has a promising appearance, but where the conditions of sowing were unfavourable the plant has a doleful look and needs rain very much.

No farm with a sufficiency of horse or tractor power should have foul land after this spell of drought. The value of motor ploughs and tractor power for the cleaning of land is a boon to the farmer. All too often during the busy hay season, where some hundreds of acres of grass have to be made into hay, the arable land is of necessity neglected for a time, but with the aid of a tractor the cleaning of the land can proceed at the same time. As an example of what can be done, my tractor and the two men ploughed 18 acres in three days, and this, with the ordinary two-horse teams ploughing an acre daily, would have occupied twelve horses for three days, probably more, as it is not every team that will plough an acre daily. After ploughing a field with the tractor and a four-furrow plough I use a Ransome thirteen-tine cultivator, crosswise of the ploughing, which loosens the soil, pulls up the weeds, and exposes their roots to the sun and wind. Following this treatment, and within a few days, heavy drags or harrows are drawn over the land, still further exposing the roots of couch or other weeds.

TEMPORARY LEY FOR WHEAT.

Where a field of Broad Clover or a mixture of Clover and Italian Rye Grass has recently been cleared of its hay crop, to be followed by Wheat in the autumn, the inexperienced will be puzzled to know how to treat the field in the meantime. In the ordinary course of management, where a regular flock of penned sheep are kept, the Clover and Grass would be retained for a second crop, which the sheep would eat off during September and the early part of October, and then the land would be ploughed and dressed ready for the Wheat crop; but where sheep are not kept the best method of procedure is to plough as soon after the hay crop is taken as possible, and summer fallow. Sow with Mustard early in August—which is a good substitute for the sheep dressing—and supplement the ploughing-in of the Mustard with basic slag at the rate of 4 or 6 cwt. per acre. When sowing the Wheat, this method of dealing with the field has the advantage of eliminating patches of couch which would remain when ploughed after sheep have fed off the second growth, and interfere with the Wheat crop, and also the Oats which usually succeed the Wheat.

POTATOS.

The early varieties of Potatos, such as Epicure, Sharpe's Express, Midlothian Early, and Mills's Seedling, where "sprouted" and planted from boxes, are looking remarkably well. Repeated hoeing during dry weather will aid growth before finally earthing up the haulm. Late planted Potatos are not yet showing through the soil, especially where the land was rough at planting time. *E. Molyneux.*

Obituary.

Mrs. Wray Hunt.—We learn with deep regret that Mrs. Wray Hunt, the youngest daughter of Sir Joseph Paxton, died at her home, Ruddington Manor, Nottinghamshire, aged 77. Her remains were laid to rest in Edensor Churchyard on the Chatsworth Estate (according to her expressed desire), near to the famous gardens which her father created for the Duke of Devonshire. As little Annie Paxton, she was probably the first person in this country to be photographed sitting on a leaf of Victoria regia some 70 years ago. Her love of everything pertaining to gardens and her great interest in gardeners fostered in early life continued to the end.

Her charming way of recounting incidents and impressions of famous gardens and gardeners caused her conversation to be both interesting and educative, and added to this charm of personality was her fixed resolve to help any who sought her assistance on the subjects so dear to her.

She was held in high esteem by the members of the Ruddington Garden Society.

John Wallis.—We regret to report the death of Mr. John Wallis, for many years gardener at Orwell Park, Ipswich, Suffolk. His length of service at Orwell Park, firstly under Colonel Tomline and afterwards under the Rt. Hon. E. G. Pretyman, M.P., covered a period of 44 years, and during that time many extensive alterations and improvements were successfully carried out under his directions. He was a clever all-round gardener, but specially good in the management of Bambusa, Arundinaria and Phyllostachys, of Strawberry British Queen (both inside and out), and of Epiphyllums. Mr. Wallis retired about ten years ago and went to live at Trimley, near Felixstowe, where for some time he enjoyed good health, but latterly he suffered greatly and, after a lingering illness, passed away on the 8th inst., in his 86th year. He was interred in Nacton Churchyard, which is situated within a short distance of Orwell Park, the place he loved and tended so long.

TRADE NOTES.

In view of the difficulties imposed on importers of Dutch bulbs by the recent licence notice, the Chamber of Horticulture requested the Department to consider the possibility of a revision. In reply to this enquiry, the following letter has been received:—

Board of Trade,
Department of Import Restrictions,
22, Carlisle Place, S.W.1.
June 14, 1919.

SIR,

In reply to your letter of 10th June, respecting the import of bulbs, I have to inform you that the position is as follows:—

I am prepared to issue licences to importers on application for the importation of certain varieties of bulbs only, viz., Hyacinths, early single and double Tulips, Crocus, Spanish Iris, Gladiolus, Chionodoxa, and Scilla sibirica.

Applications should show the number of packages of bulbs of the varieties named above which the importer anticipates being in a position to import before September 1.

With regard to Belgium, licences will be issued for all bulbs and plants on receipt of the number of packages with marks and numbers of same, for each consignment.

(Sd.) JOHN B. KARSLAKE,
Deputy Controller.

The Board of Agriculture and Fisheries have issued an Order which allows Gooseberries free from American Gooseberry Mildew to be imported under licence into this country for jam making purposes. Such licences will only be issued on condition that the Gooseberries are free from American Gooseberry Mildew and consigned to a jam factory.

Reports received recently by the Board of Agriculture and Fisheries show that in certain Continental exporting countries American Gooseberry Mildew is prevalent, and importers should therefore exercise great care in purchasing; as only those consignments which are passed as "free from American Gooseberry Mildew" by the Board's Inspectors at the port of entry will be permitted to be forwarded to their destination.

Application for licences, which should be made to the Secretary, Board of Agriculture and Fisheries, 72, Victoria Street, S.W.1, should state quantity of fruit to be imported, name and address of importer, name and address of jam manufacturer. The port of entry must also be stated so that arrangements may be made for the necessary inspection.

The Sevenoaks Farmers' Union Auction Mart, Ltd., has decided to open a stand and office in Covent Garden Market for the disposal of the members' produce. A salesman and staff have been appointed, and it is proposed to commence trading at an early date.

MARKETS.

COVENT GARDEN, June 18.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Plants in Pots, &c.: Average Wholesale Prices.

		—Dbl. Mauve ...	12 0–15 0
		—Dbl. Purple ...	12 0–15 0
		Violas, per doz. bun.	3 0– 4 0

REMARKS.—All Pyrethrums are finishing up quickly, owing to the dry weather. White and coloured Stocks are taking the place of the above; there is also a good supply of white Pinks. Lilium longiflorum is getting more plentiful and prices are gradually lowering. Lily of the Valley is unobtainable at the present time. The best sorts of indoor Roses are Mme. Abel Chatenay, Ophelia, Melody, Sunburst, and Molly Sharman Crawford. Outdoor varieties are now more attractive, these chiefly consist of Général Jacqueminot, Mrs. John Laing, General McArthur, and Frau Karl Druschki. Carnations are again sufficient for the demand, and have dropped considerably in price since last week. Choice white flowers chiefly consist of Gardenias, Lapagerias, Pancratiums, White Gladiolus, and Stephanotis. The coloured Gladioli now on offer consists of Brenchleyensis Fairy Queen, Ne Plus Ultra, and Blushing Bride. Gypsophila elegans is arriving in excellent condition, and Gaillardias are now being offered. There is an abundant supply of Sweet Peas, Cornflowers, Iceland Poppies, and Spanish Iris.

REMARKS.—Fruits now on offer include Grapes (Muscats and Black), Melons, Strawberries, Peaches, Nectarines, Figs, Cherries, Black Currants (French), Apricots (Spanish), Canteloupe Melons (French), and Green Gooseberries. These are all obtainable in fairly large quantities. Consignments of Cape fruits to hand this week, consist chiefly of Pears. Strawberries are now yielding a full supply from all sources, packed in punnets, chips, and pecks. There are increased quantities of Asparagus to hand this week. Peas and Broad Beans are now plentiful, but supplies of Cauliflowers and Cabbages are somewhat limited. Dwarf Beans are more plentiful, and so are Cucumbers (English and Dutch). Supplies of Tomatos are increasing daily.

GARDENING APPOINTMENTS.

Mr. Henry Charman, as gardener to Sir PHILLIP SASSOON, at Beleaire, Lampsea, near Hythe, Kent.

Mr. N. Nash, as gardener to Sir ARTHUR MAYS-ROBSON, at Seale, Farnham, Surrey.

Mr. J. Gilbert, recently gardener to Lady COWELL, Clifton Castle, Bedale, Yorkshire, as gardener to Rt. Hon. LORD MASHAM, Godmersham Park, Canterbury, Kent.

Mr E. T. Kirtland, for 12 years gardener to ARTHUR BRAY, Esq., Walton Heath, Surrey, and for some time temporary gardener to the Lady MARGARET RYDER, High Ashurst, Dorking, as gardener to COLONEL WARDE, Barham Court, near Maidstone, Kent.

Mr. E. G. Jones, for the past 5½ years gardener to Mrs. TAYLOR, Stoney Ware, Marlow, Bucks, and previously 14½ years gardener, Homestall, Barley, Herts, as gardener to W. C. BOND, Esq., Shalesbrooke, Forest Row, Sussex. [Thanks for 2s. for R.G.O.F. Box.—EDS.]

CATALOGUE RECEIVED.

ELISHA J. HICKS, Twyford, Berks.—Roses.

SCHEDULES RECEIVED.

National Chrysanthemum Society.—Exhibition to be held in conjunction with Royal Horticultural Society's meeting on November 4, 1919. Secretary, Chas. H. Curtis, 35, Wellington Street, Covent Garden.

City of London Rose Society.—Book of arrangements and schedule of prizes for the Fifth Annual Exhibition, to be held at the Cannon Street Hotel, Cannon Street, London, E.C., on Friday, June 27, 1919.

Answers to Correspondents

Abelia floribunda: *J. B.* Your plant of Abelia floribunda making abundant growth and flowering sparsely suggests that it is in a somewhat shaded situation in the unheated greenhouse. The best plants in the London district are usually seen growing on south or south-west walls, where the shoots get well ripened. Pruning may be done now. If your specimen is too large to move, root a few cuttings and try growing the plants against a sunny fence or wall.

Apples Injured by Grubs: *H. M.* The leaves were shrivelled when they reached us, but from their appearance and the presence of a Syrphid fly larva they were probably attacked by the Rosy Apple Aphis—A. malifoliae. As aphides only suck the juice of the leaf and do not eat the leaf tissue, spraying with lead arsenate is useless. A contact wash is necessary, but, owing to the extensive curling of the foliage caused by this insect, spraying must be done early in the season; the best time is in the spring when the petals are showing pink but not open. Paraffin emulsion or any good proprietary contact wash is then effective. The trees should be thoroughly wetted until they just begin to drip, and the specific should be applied with as much force as possible. The worst of the attack is probably over.

Arsenate of Lead: *D. S. S.* During the past two or three years large numbers of complaints have been made alleging failure on the part of arsenate of lead. This may have been due to the fact that during the war there has been a very serious shortage of lead. It is quite possible that the users have been dealing with very inferior preparations. It is sometimes a common practice to mix arsenate of lead with soft soap, which tends to render the arsenate very harmful to the foliage of the trees. Messrs. Voss and Co., Ltd., 8a, Millwall, E.14, supply a very fine quality of arsenate of lead in the paste form, which requires mixing with water only. One pound of this preparation is sufficient to make about 30 gallons of spray. It is now very late in the season to apply arsenate of lead, the best time being when the buds on the trees are just beginning to open. It is far more economical to spray at that time of the year, as considerably less fluid is required to cover the trees. However, much may be done to control such pests as the caterpillars of the lackey moth and vapourer moth on Apple trees now. Arsenate of lead may also be used against the attacks of the codlin moth, Gooseberry and Currant moth, Raspberry moth, winter moth, Pear and Cherry sawfly and Raspberry beetle. It would be advisable to pick the Gooseberries and Currants before spraying your trees, otherwise you run the risk of poisoning when the fruits are eaten. With regard to vegetables growing under trees, provided they will not be required for use for at least a month, there would be no danger from the spray fluid coming in contact with them.

Box Hedge: *Enquirer.* June is the most suitable month in which to clip the young shoots of Box, for the work must not be done until all danger from frost is over.

Bush Apple Tree Failing to Fruit: *F. W. M.* The tree probably failed to fruit because it was growing too freely and required root pruning. Seeing that you root-pruned it in January last, it would receive a check, and that would account for the fruit not setting this season. Doubtless next year, when the roots are re-established, the fruits will set satisfactorily.

Diseased Lilies: *T. S. C.* Your Lilies are affected with a species of Botrytis. The fungus attacks all kinds of Lilium without any exception, either wild or cultivated, and may appear at any stage of their growth. In its first stages it usually forms buff coloured spots on the leaves or buds and finally becomes covered with a greyish mould. As soon as the disease appears all affected parts should be cut off and burned, while the healthy plants in close proximity should be sprayed with Bordeaux mixture. If the disease persists in spreading take up the plants and bulbs and burn them.

Diseased Tomatos: *F. W. B.* The Tomatos are suffering form a disease commonly known as "Sleepy Disease," which is caused by the fungus Fusarium lycopersici. The disease can always be identified by the brownish ring just within the bark at the base of the stem. The fungus flourishes in the soil and enters the plant by the root. With regard to treatment, it is useless trying to save plants which are diseased and, as the organism is inside the plant, it is useless to spray. All diseased plants should be uprooted immediately the disease appears and burned. The soil in which the plants grow should be either cleared out of the house and fresh compost used, or the affected soil may be rendered free from infection by sterilising by heat at a temperature of 180° to 200° F. for half an hour. In the winter every part of the greenhouse should be washed with a solution of carbolic acid and water (1 of the acid to 20 parts of water). Every care should be taken in growing the plants; allow them ample room, for they need plenty of air, and light.

Insects: *C. F.* The insects are probably sawfly larvae, but when they reached us they had pupated, and it will be necessary to wait a few days for the perfect insects to emerge before they can be identified.

Land for Ex-Soldiers: *A. E. A.* There is every prospect of an energetic man succeeding on a small holding conducted on proper lines, and probably the best method of cropping is that which may be described as "semi-intensive" cultivation. For further particulars write for copies of guides to small holders supplied by the Board of Agriculture and Fisheries. The guides deal with the following subjects:—1, Market Garden Crops; 2, Potato Growing; 3, Fruit Growing; 4, Pig Keeping. All enquiries should be addressed to the Estates Management Branch, Board of Agriculture, 72, Victoria Street, London, S.W.1.

Names of Plants.—*A. N.* 1, Potentilla fruticosa; 2, Funkia ovata marginata; 3, Inula orientalis; 4, Clematis recta; 5, Phlomis fruticosa; 6, Chrysogonum virginianum; 7, Rhazya orientalis; 8, Buddleia globosa; 9, Deutzia scabra fl. pl.; 10, Periploca graeca; 11, Poterium Sanguisorba; 12, Ononis rotundifolia.—*L. H.* 1, Missing; 2, Amelanchier canadensis; 3, Pyrus Aria (White Beam Tree); 4, Tilia platyphyllos var. asplenifolia; 5, Salix purpurea.—*T. E. N.* 1, Laburnum Adamii; 2, Cupressus Lawsoniana var.; 3, Laburnum Parksii; 4, Lonicera alpigena; 5, Cupressus pisifera var. plumosa aurea; 6, Spiraea canescens; 7, Crataegus Carrièrei.—*R. C. W.* Aegopodium Podagraria (Gout Weed). The best method of eradicating the weed is to dig up the root-stocks and burn them.—*W. E. P.* So far as can be determined by the faded and imperfectly developed flowers sent, they are:—1, Laelia-Cattleya Gottoiana (C. Warneri × L. tenebrosa); 2, 3 and 4 varieties of Laelia purpurata.—*E. L. L.* We do not recognise the variety of Rose; send a bloom to some nurseryman who can compare it with those in his collection.—*C. K.* Populus trichocarpa.—*D. G. P.* 1, Spiraea van Houttei; 2, Azalea pontica; 3, Syringa persica; 12, Azalea calendulacea var.; 22, Spiraea canescens.—*T. A. L.* Crataegus Douglasii.

Raspberries Attacked by Insects: *O'B., Reading:* The insects you send are Raspberry Beetles, Byturus tomentosus. They attack the Loganberry also, and are found in Apple flowers, but appear to do no damage to that fruit. There is no satisfactory method of control. The insects are sometimes shaken or pulled out into receptacles (*e.g.*, household dustpans) covered with tree grease, but deep cultivation of the soil from May to September gives the best results.

Rose Conrad F. Meyer Unhealthy: *L. D.* There is no evidence of any attack by fungus or insect pests on the parts of the tree sent. The dark "canker"-like marks on the surface of the stem do not appear to have been caused by a fungus. The unhealthy condition of the plants must be due to some unfavourable condition, such as unsuitable soil, drought or imperfect drainage, which only those on the spot could determine.

Tennis Court: *J. F. R.* The dimensions of a tennis court, with a diagram, were given in *Gard. Chron.*, April 19, 1919.

Tenant Removing Trees: *J. H. B.* The trees were your property and the tenant had no right to cut them down without your sanction. In any case, the wood belonged to you, and in using it as firewood for his own purposes, the tenant has rendered himself liable to you in damages. In the case of trees destroyed to prevent the spread of incurable disease, the amount of damages payable by a tenant would be limited to the value of the wood which he used for his own purposes. If, however, this act was unnecessary, he would be liable, in addition, for the general damage to the garden, including loss of shade. In our opinion, silver leaf is not curable by means other than total destruction.

Tented Caterpillars on Privet: *Miss E. S.* The best methods of destroying the Tented Caterpillars on Privet are: (1) by hand picking, (2) by flaming with a plumber's blow lamp, (3) by spraying with a mixture of composed of soft soap (20lbs.), paraffin (2 gallons), nicotine (½lb.), water (101 gallons). Emulsify the paraffin and soft soap, dissolved in 10 gallons of hot water, by means of a garden syringe with rose attached, add the nicotine and make up with the rest of the water. Sub-multiples of the formula may be taken. Please send fresh specimens packed in a tin box.

Vine Leaves Turning Yellow: *A. B.* The leaves of your Muscat of Alexandria vines are not diseased, but they show a great lack of substance and are more or less etiolated. These conditions may arise from sourness of the border, which sometimes occurs when light and air are excluded, or when the damping of the paths and other bare spaces is carried out to excess. If you have reason to suspect that sourness of the soil is the cause, a handful of newly slaked lime to the yard, and watered immediately, should counteract the sourness. Old lime is useless for this purpose, it must be fresh from the kiln. Two or three days afterwards apply sulphate of iron, at the rate of ¼oz. dissolved in one gallon of water, to every square yard of border, using a water pot with a rose for the purpose. This application should be followed by ½oz. of sulphate of ammonia or nitrate of soda, in a finely powdered state, spread evenly over the same place and lightly watered in. Saltpetre (nitrate of potash) would answer the same purpose. Stir the surface of the border frequently when the soil is fairly dry, to the depth of one inch, and do not allow the temperature to rise too high by sun heat before the leaves show the normal colour or they will burn. When applying the lime if the border is inside the vinery, do not allow it to come in contact with fresh nitrogenous manure. In any case it would be safer to open the ventilators a little for an hour or two in the morning.

PRIVATE.

BRITISH GARDENERS' ASSOCIATION. (Reg. No. 1666 T.).

THE Standard of Wages and Hours adopted in January last is now withdrawn and a new Standard is under the consideration of the Executive Council. When this is published, an announcement will be made in these columns.—CYRIL HARDING, General Secretary, 22, Buckingham Street, Strand, W.C.2.

WANTED, HEAD WORKING GARDENER, must be capable and experienced in flowers, fruit, vegetables and lawns, three under, cottage found.—State wages required, with experience and all particulars to, A. TAYLOR, The Warren House Gardens, Stanmore, Middlesex.

WANTED, experienced GARDENER (SINGLE-HANDED), married; with good knowledge of herbaceous gardens; willing to clean and attend to motor-car and make himself generally useful in house and outside; small greenhouse; good all-round man essential; highest references required; wages 35s. to 40s. a week and cottage.—Apply, giving references and stating experience, age, and number in family, to CLAUDE BARTON, Clapham, Yorkshire.

WANTED, GARDENER (used to Vines), with wife, but no family, to live in and caretake and clean offices.—Apply, MESSRS. HYDES, Solicitors, Worcester.

GARDENER (single), to live in, 12 miles from London. Good wages; splendid home (cottage). Testimonial.—67, Wigmore Street, W.

GARDENER (SECOND) for Pleasure and Rock Garden; married; state wages required, with house, etc.—H. HALES, Thornhaugh Hall, near Peterborough.

WANTED, SECOND GARDENER able to take charge of Vines and Peaches, Pot Plants, etc.; state wages required with bothy.—S. HAYES, The Gardens, Plymyard, Eastham, Cheshire.

WANTED, an UNDER-GARDENER, age about 20; good wages.—Write or call to the Gardener, J. HUTSON, The Bungalow, Chartfield Avenue, Putney.

WANTED, ASSISTANT GARDENER for Outside work, and glass when necessary; good wages and cottage to suitable man.—Apply with refs., to JOHN S. DOIG, Nettleton Lodge, Caistor, Lincolnshire.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

THEY'RE NOT STICKY.

Beacon Oilskins are quite free from any stickiness, and, what is more important, they never fail to keep out the hardest rain or sleet. Hundreds of farmers, gamekeepers, and other outdoor men, women and children wear them, because they bring weather comfort. You ought to wear them if you want to keep dry in any deluge. The Beacon Booklet will help you to choose the style you need. Children's Coats from 16s. 6d., Men's from 25s., Ladies' Smart Oilskins, 2[illegible]. Long Leggings from 5s. Sou'westers, from 3s. Your money back if they don't satisfy you entirely. Send postcard to-day for our Free Booklet of "Weather Comfort." — Send now—before you forget—to BARBOUR'S, LTD., 66, BEACON BUILDINGS, SOUTH SHIELDS.

HOW MANY PEOPLE

in this country who eat dried Dates ever think of these fruits growing on trees, succulent and fresh?

Probably not one in a hundred. Yet the subject of Date-growing is one which has interest for all, and especial interest for those who are intending to take up fruit-growing in a tropical or sub-tropical colony. They should at once procure and read the excellent work by Mr. Paul Popenoe,

DATE GROWING IN THE OLD WORLD AND THE NEW

in which they will find every sort of information necessary to the Date cultivator. The price is 9/6 post free, and it can be obtained from

FERNS AND FERN CULTURE

By J. BIRKENHEAD. Revised by F. PARSONS.

THIS little work contains all that the Fern-lover needs to know about the raising and cultivation of Ferns. It tells him where the different classes of Ferns are to be found growing wild; the modes of growth of the different species; the sort of treatment each kind of Fern requires; how to tend the plants in sickness and in health; how to eradicate the pests, both insect and fungous, which threaten their well-being. It is freely illustrated, and all the illustrations serve a definite purpose. The book is excellently printed, on clear, good quality paper; it is well bound in pale green cloth, and this is protected by a second cover of transparent, grease-proof paper. Although so reasonable in price, it is worth almost any money, for it is quite unique.

Send 1/3 for a copy, post free, from

GARDENERS' CHRONICLE, Ltd., 41, Wellington St., Strand, W.C.2.

Dry Spray IS THE BETTER WAY.

Easier! Quicker! Cheaper!

Potatoes must be Sprayed to prevent disease. STRAWSONITE (with its highest copper percentage) is the best possible powder, and the ECLIPSE SYRINGE is made on purpose to make the operation as simple and easy as possible. A child can use it, and anything from five rods up to ten acres is easily sprayed by the ECLIPSE.

WHAT A SATISFIED USER SAYS.

Gables Farm, Rotherfield, Sussex, March 12, 1919.

"I am entirely in favour of dry spraying, chiefly for the reason that it gets down where the wet does not."—ALFRED HICKS.

MR. REGINALD FARRER'S SECOND EXPLORATION IN ASIA.

No. 2.—THE VALLEY OF THE NGAW CHANG.

EVEN from the wooded passes that cut across the divide between the Nmai Hka and the Ngaw Chang one still gets no hint of any great alpine range coming near to hand. High and higher, indeed, rise the chains of hills that tortuously envelop the winding courses of the river far below; but the whole scene is one vast crumpled verdure of forest, except where a burnt hillside has sprung up again in coppice more vividly green than the rest. But, though the tropics even here subsist, in Gesnera and Begonia, signs begin to appear of homelier things. Anemone obtusiloba springs to light, charming and delicate in its young stage, though ultimately the universal plague of alpine Asia; and all the Wilsonian brambles wave riotously about in every direction. They are truly an amazing crew, vast and violent weeds that inspire one anew with sympathy for the cataloguers that had to try and discover some saleable beauty in each. Some, indeed, do have a single point of attractiveness—a stem of burnished mahogany brown, or milky whitewash; one has a really fine white flower, and another a really handsome vine-like leaf. But in no case is this single attraction enough to redeem the plant's terrific habit, or give it any shadow of claim for admission to the garden, or to anything except the wildest woodland, where, as a matter of fact, they would make only too successful covert, defeating any beater who was not armed from head to foot in coat of mail. So far one only, the hugest and most hideous of all, has shown me signs of fruit. This, in appearance suggesting a gigantic mounded-up Blackberry, produces in riotous abundance very heavily-laden terminal bunches of fruit, ripening sporadically in the clusters, and resembling rather small Raspberries of a golden-orange colour. But these are really delicious, and not unlike Raspberries in their crisp sweetness; a garden hybrid between this and Rubus Idaeus or R. fruticosus, might well produce something of market value, if the size of the fruit can be thus improved, and the overwhelming crop maintained. But who can tell me if this particular Wilsonian treasure has even condescended to fruit with us at all? In any case, let those interested be warned: even if I myself am tempted to send any of these plants, I shall consider the minutest quantity of each as quite sufficient to burden any gardener with.

Afar, in a bend and junction of rivers, the military post of Htawgaw rears its proud head to something over 4,000 feet. On this eminence, accordingly, two new Rhododendrons at once appear, sparsely, amid the sun-baked coppice beneath an aromatic canopy of a thin, tessellated-trunked Pine, whose fine green and hot scent translate one immediately to the Italian Riviera and P. maritima. Of the Rhododendrons one, R. quinquefolium, is here very rare, forming a bush of six feet or so, with small Azaleas of magenta lilac; the other is, I fancy, a lapponicum, stunted here, on this lonely outpost, but becoming a tall pillar of 12 or 14 feet in the half-open, half-shady places up the wooded banks of the Ngaw Chang, as far as the foot of Hpimaw Hill. Though its tiny scentless flowers are so pale as to be almost white, with minute carmine frecklings, and they have preposterously far-exserted white stamens, their multitude is so lavish as to give the plant definite value as a solid mass of pale colour. These two are the advance-guards of the Alps; for, from Htawgaw Fort, looking north-east, high alpine jags of snow and dark rock at last appear over the distance, looming above the far windings of the river, and the crumpled enormous chaos of the wooded ranges. But the road now descends to the depths of the Ngaw Chang vale again, on the other side of Htawgaw, and for three more days continues its course circuitously, round and about the innumerable sharp spurs that sink so steeply to the river that only very occasionally are there a few narrow stretches or bays of flatness sufficient to grow Rice. The forest is thinner now, though not so tall and tropical; there are great stretches of the road like an English park, with an Oak of vivid green dotted up and down the arduous slopes of grass and Bracken. But even here the tropics persist; on Htawgaw Hill there is still a Derris like a rose-pink Wistaria; and a horrible magenta Lasiandra thing that luxuriated in the hottest jungle long before the railway reached Myitkina; to say nothing of Orchids, Coelogynes and Dendrobiums on the trees, and great black boulders in the green twilight of the way; though, indeed, these had hitherto rather surprised me by their scarcity.

Meanwhile the Ngaw Chang flows very deep in its bouldered bed, under a heavy tangle of dense growth on either side. In the opener places the little Htawgaw Rhododendron makes blots of pallor on the sombre weight of green, and there is another beautiful one, a taller, thinner bush with medium-sized Azalead flowers of vividest pure cherry-rose, conspicuous from afar, where it juts from some shady precipice in the woodland. But in the close sheltered atmosphere of that gorge the warmth must be such that I can have scant hope of hardiness for the most beautiful of the Ngaw Chang's early Rhododendrons—a magnificent evergreen white-trumpet, which overhangs only the darkest, deepest, and most difficult cliffs in these deep and difficult chines. March- and April-flowering Rhododendrons from the warm gullies down in these ranges are not particularly likely to bring their blossoms to perfection in an English March or April, even though the plant itself may very well be hardy. In both respects I have my doubts of the Ngaw Chang beauty, with its lovely big white blossoms, flushed in the bud with rose, and at the base with yellow, and possessing a delicious fragrance. I did, indeed, at last secure a specimen growing in open light on a sunny boulder. But even this did its best to prove the plant's proclivities by being sickly and stunted and starved. The best beauty of that particular gorge was a very fine Iris of the tectorum type, that occurred copiously among the scrub at the mouth, and was a magnificent sight, with three-foot candelabras of golden-crested, lavender blossoms, with purple-velvet mottlings round the crest. I cannot remember ever having seen I. Milesii represented as having such fine flowers—fully the equal of I. tectorum, allowing for their much greater number; but, if not I. Milesii, this looks like another and a better member of the same group—and possibly, of the same unsatisfactoriness in our climate.

But now, though the vegetation in the valley shows little change, the high alps are heading into sight at the top of the distance, in a great barrier of austere brown-and-black pyramids whose dumpy lines reveal, alas, the absence of limestone, and whose forested flanks are riven and corrugated by innumerable corries that look mere wrinkles, but are, in fact, huge rifts disguised in unnegotiable forest, converging to deeper gullies, yet at the foot of the peaks, concealed in forest more unnegotiable still. And, in front, far above us, on a bared high spur projecting from the alpine amphitheatre behind, appears a tin-roofed settlement of long, low wooden shanties; that is Hpimaw Fort, the last outpost of Britain in this remote no man's land (that ceased to be Burma long ago, even before we reached Myitkina), existing only to guard the pass, up behind, from a steady influx from China, which might otherwise make good its footing and establish the ancient claim of China to this uncharted wilderness of barely populated alps which, however valueless in itself, would serve as too wide a gate into Burma. *Reginald Farrer.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM OERSTEDII.

In his fine group at the R.H.S. Chelsea Show on May 20-22, Sir Jeremiah Colman, Bart., included in a very interesting selection of rare species the pretty dwarf Odontoglossum Oerstedii, which has been rarer in gardens for some years past, and threatens to become lost to cultivation unless again imported. No use has been made of the species by the hybridist, but attempts should be made to cross it with others, also to raise plants true from seed, and thus to some extent secure independence of native collections.

The plant was discovered in 1848 by Warscewicz on the highest slopes of Irazu and Turrialba in Costa Rica, ranging from 7,000 to 9,000 feet elevation. It was described by Reichenbach in *Gard. Chron.*, March 10, 1877, p. 302.

Odontoglossum Oerstedii is one of the dwarfest, most compact and freest-flowering species. The pure white flowers with yellow base to the lip, are borne generally two or three on a spike, arising very effectively above the closely-tufted plant with its rounded pseudobulbs, each furnished with a stalked elliptic-lanceolate leaf of very dark green colour. The plant thrives in the Odontoglossum house in suspended Orchid pans.

A fine specimen, shown by Mr. Lee at the meeting of the Royal Horticultural Society on March 25, 1884, was awarded a First-class Certificate.

THE ALPINE GARDEN.

PRIMULA HARROVIANA.

THE charming little Primula illustrated in Fig. 156 gained an Award of Merit when shown by Mr. A. K. Bulley at the meeting of the Royal Horticultural Society on May 27 last. Seeds of it were collected on his behalf by Mr. Cooper in Bhotan in 1915, and on flowering the plant was determined to be a new species by Prof. Bayley Balfour, who named it in compliment to Mr. Harrow, of Edinburgh Botanic Garden.

The species bears a great resemblance to the Western Himalayan P. Reidii, but the leaves are not so thickly covered with white silky hairs, so characteristic of the latter species. Owing to this fact, it has proved an easier plant to manage, for it is not so liable to damp off as P. Reidii.

P. Harroviana is a low-growing plant with tufts of bright green leaves having crenate margins. The flower stems, about four inches high, are covered with a white meal and bear a closely-packed head of pure white flowers. The blooms are about half an inch in diameter with the edges of the corolla fimbriated.

The plant has proved quite hardy at Neston, and has been propagated both by means of seeds and division. *W. I.*

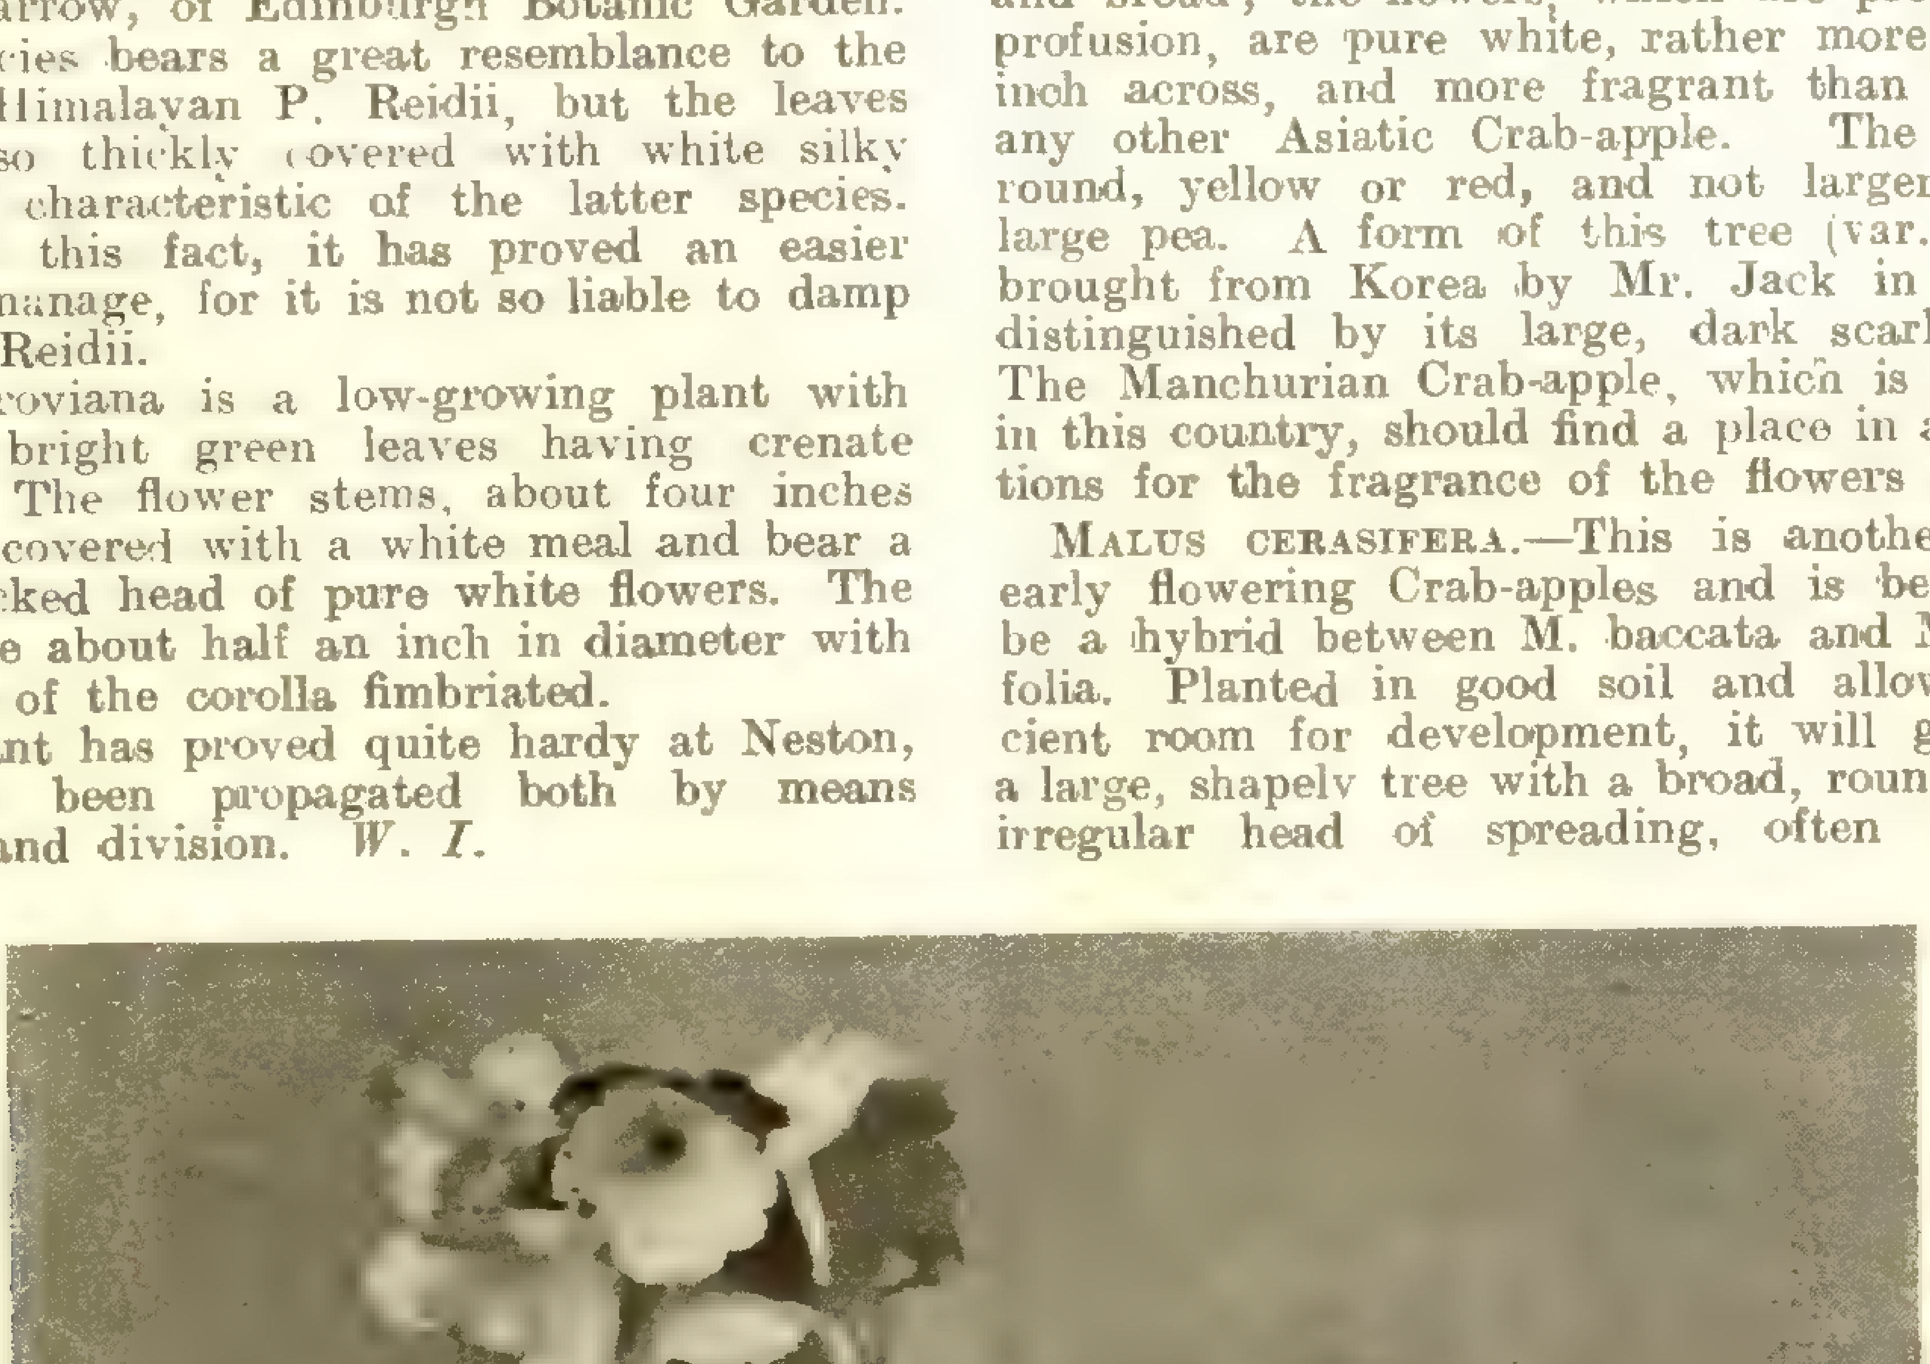

FIG. 156.—PRIMULA HARROVIANA; FLOWERS WHITE (R.H.S. AWARD OF MERIT, MAY 27, 1919).

TREES AND SHRUBS.

ASIATIC CRAB-APPLES.

WE gather from a Bulletin issued recently from the Arnold Arboretum, Harvard University, Jamaica Plain, Mass., U.S.A., that the flowering of the Asiatic Crab-apples makes one of the principal spectacular displays of the year in the Arboretum; and of these displays only that made by the Lilacs attracts a larger number of visitors. It will be seen that the Arboretum authorities retain the old generic name of Malus for these Crabs. Among these Crab-apples are numbers of small trees which should find a place in every northern garden, for few trees which are hardy in New England are more beautiful when covered in May with their white, pink or rose-coloured flowers, or in autumn when the branches are loaded with their brilliant red, scarlet or yellow fruits.

MALUS BACCATA MANDSHURICA is the earliest of these Crab-apples to open its flower-buds in the Arboretum. A native of Manchuria, Korea and northern Japan, it is the eastern form of the better known Malus baccata, the Siberian Crab-apple, which reached Europe more than a century ago and for a long time was one of only two Asiatic Crab-apples known in western gardens. The Manchurian form as it grows in the Arboretum is a tree twelve or fifteen feet tall and broad; the flowers, which are produced in profusion, are pure white, rather more than an inch across, and more fragrant than those of any other Asiatic Crab-apple. The fruit is round, yellow or red, and not larger than a large pea. A form of this tree (var. Jackii), brought from Korea by Mr. Jack in 1905, is distinguished by its large, dark scarlet fruit. The Manchurian Crab-apple, which is still rare in this country, should find a place in all collections for the fragrance of the flowers alone.

MALUS CERASIFERA.—This is another of the early flowering Crab-apples and is believed to be a hybrid between M. baccata and M. prunifolia. Planted in good soil and allowed sufficient room for development, it will grow into a large, shapely tree with a broad, round-topped, irregular head of spreading, often drooping, branches. The flowers are fragrant and larger than those of the other Asiatic Crab-apples, with pure white or occasionally greenish petals; and the fruit, which varies in size on different plants, is globose and dull red.

MALUS MICROMALUS, which is also an early flowering plant, is one of the least known of the Crab-apples. It was first sent to Europe from Japan by Von Siebold in 1856 under the name of "Kaido," a name which in Japan belongs to Malus Halliana. In Japan this tree is rare and known only in gardens, and by Japanese botanists is believed to have been introduced into their country from China and to be a hybrid possibly of M. baccata with M. spectabilis. The habit of this plant is more pyramidal than that of other Crab-apples, and this habit makes the plants conspicuous in the collection. The largest plants are covered this year with their small, pale pink, delicate flowers which will be followed by light yellow fruit, often rose colour on one cheek. A plant of Malus micromalus first came to the Arboretum from the Paris Museum in 1888, and the plants now growing here are descendants of that plant. It is still one of the rarest of the Asiatic Crab-apples in western gardens.

MALUS HALLIANA, with its form Parkmanii which has double flowers, is perhaps the most distinct of all Crab-apples in the colour of its rose-red flowers. It is a shapely small tree, with erect and spreading stem forming a narrow vase-like head, and dark green leaves. The globose reddish fruit is not larger than a small pea. The Parkman Crab was among the first Japanese trees to reach this country direct, having been sent by Dr. George R. Hall in 1862 to Boston, where it was first planted in Mr. Francis Parkman's garden on the shores of Jamiaca Pond. This Crab-apple is a favourite in Japanese gardens, where it is known as "Kaido," but has not been found in a wild state. Whatever its origin, the Parkman Crab is one of the most distinct and beautiful of the small trees which flower here during the early days of May.

MALUS THEIFERA, from central and western China, is closely related to Hall's Crab. It is one of Wilson's introductions through seeds sent to Veitch in 1900, and in 1907 to the Arboretum, where it is now twelve feet high. It has upright, spreading, rather zigzag branches, which are densely studded with short spurs which bear numerous clusters of flowers rose-red in the bud, becoming pale and almost white when fully expanded. In central China the peasants collect the leaves and from them prepare the palatable beverage which they call red tea. From this fact the specific name is derived.

MALUS FLORIBUNDA, by many persons considered the most beautiful of Crab-apples, was introduced into Holland by Von Siebold in 1853 from Nagasaki, Japan. The place where it grows wild still remains unknown, although probably it is one of the high mountains of Kyushu. Japanese botanists and nurserymen confuse it with the Parkman Crab, and Wilson has not seen it in Japanese gardens. It is a broad, round-topped tree-like shrub sometimes twenty-five feet tall with stout branches and slender arching and pendant branchlets. The clustered flowers are white when fully expanded, rose-red in the bud, and as they open in succession the two colours make a beautiful contrast. The fruit is about the size of a pea, yellowish or yellowish brown; from some plants it falls in the early autumn, on others it remains on the branches during the winter or until devoured by birds, who are particularly fond of it. Several plants with persistent fruit are growing close to the Administration Building in the Arboretum, and during the winter are filled with numerous species of birds, including pheasants, which are fond of these Crab-apples. A hybrid between M. floribunda and perhaps M. cerasifera appeared in the Arboretum among a lot of seedlings of M. floribunda in 1883 and has been named M. Arnoldiana. It has the habit and abundant flowers of M. floribunda, but the flowers and fruit are nearly twice as large. It is a handsomer plant than M. floribunda and one of the most beautiful of the Crab-apples in the Arboretum.

MALUS SIEBOLDII is another of the species introduced from the gardens of Japan into Europe by Von Siebold in 1853. It is a low, dense shrub of spreading habit with the leaves on vigorous branchlets three-lobbed, small flowers white tinged with rose in colour, and small yellow fruits. A good specimen may be seen on the left-hand side of the Forest Hills Road. Von Siebold's Crab is really a dwarf form of a species common on the Korean Island of Quelpaert, and on the mountains of central Japan and Hokkaido, to which the name var. arborescens has been given. This is a tree often thirty feet or more tall, with ascending, wide-spreading branches, twiggy branchlets and minute fruit yellow on some and red on other individuals. Although the flowers are small, they are produced in immense quantities, and this species has the advantage of flowering later than the other Asiatic Crab-apples. Another variety of Von Siebold's Crab (var. calocarpa), raised in the Arboretum from seed sent in 1890

from the Nikko mountains of Japan by Dr. W. Sturgis Bigelow of Boston, has bright red fruits each half an inch in diameter. When in fruit this is the handsomest of the Japanese Crab-apples.

MALUS SARGENTII, from salt marshes in the neighbourhood of Mororan in northern Japan where it was discovered by Professor Sargent in 1892, has qualities which give it a distinct individuality, perhaps its own. This species is a dwarf with rigid and spreading branches, the lower branches flat on the ground; it is well suited for covering slopes and banks. The flowers are in umbels, the petals saucer-shaped, round and of the purest white, and are followed by masses of wine-coloured fruit which is covered by a bright bloom and, unless eaten by birds, remains on the plant well into the spring.

MALUS SPECTABILIS, cultivated by the Chinese from time immemorial and introduced from Canton in 1780, was the first of the Asiatic Crab-apples cultivated in Europe. Like several other species, it is not yet known in a wild state, but is probably of hybrid origin. It is a tree from twenty-five to thirty feet high, with a wide vase-shaped crown made of numerous spreading and ascending branches and short branchlets. The flowers are pale pink, more or less semi-double and very fragrant, and the fruits are pale yellow, nearly globose, and about three-quarters of an inch in diameter.

MALUS SCHEIDECKERI is supposed to be a hybrid between M. spectabilis and some unknown species, possibly M. micromalus. It is a small pyramidal tree with small flowers produced in great abundance and is well worth a place in every collection of these trees.

MALUS PRUNIFOLIA var. RINKII, the Apple cultivated in Japan for its fruit before the advent of foreigners and of Chinese origin, has been mentioned in former Bulletins, notably that of May 15, 1916. The wild type of this Apple was discovered by Wilson in Central China in 1907. From seeds sent to the Arboretum plants were raised and one of them is now blooming for the first time; it is on Bussey Hill, in the collection of Chinese Apples, Pears and Cherries. This is now a small tree, about ten feet high, with flowers like those of the common Apple and fully an inch and a half across. The fruit of Rinkii is longer than broad, yellow with a reddish cheek or entirely red, and the persistent calyx is raised, and not depressed as in the common Apple. This is the wild parent of the races of Apples long cultivated in the Orient, and since it fruits freely in the hot moist valleys of central China equally as well as in the cold regions of northern Korea it may prove of value to pomologists in breeding new races of Apples.

Space does not permit even a brief mention of all the species and hybrids of all the Asiatic Crab-apples in the Arboretum collection. Among them, however, are trees suitable for the avenue, park or garden, shrubs for lawn borders and slopes of banks, all absolutely hardy in the coldest parts of New England, and all to be depended upon to produce in spring blossoms in profusion. The plants grow quickly in good soil, love to have the breezes blow freely through their branches, and many of them begin to flower and produce fruit when only a few years old. In collections like that of the Arboretum they hybridize freely, and the species can only be propagated by grafting or budding.

NEW OR NOTEWORTHY PLANTS.

RHODODENDRON OLEIFOLIUM, FRANCHET.

BOTANICALLY and as a decorative plant in the garden, Rhododendron oleifolium (see Fig. 157) is a very distinct Chinese species. Its nearest ally is R. racemosum, which is one of the most beautiful and valuable species in cultivation.

R. oleifolium was first introduced by the Abbé Delavay about 1885. More recently Mr. George Forrest collected seeds at the eastern end of the Tali Range in Yunnan at 8,000 to 10,000 feet elevation. His numbers 4132, 4133, 4169, 4170 and 6770, collected about the year 1906, represent this species, and suggest that it is a fairly common plant. R. oleifolium is also included among the numbers of 1910.

In habit, this species is an elegant, loosely-branched evergreen shrub, specimens in this country being at present up to $2\frac{1}{2}$ feet in height, but doubtless they will grow taller. Seedlings flower at an early stage when about 6 inches high. The leaves are narrowly lanceolate, averaging $1\frac{1}{2}$ to 2 inches long, distinctly glaucous and scaly beneath. The arrangement of the flowers is the most distinct character. They are both terminal and axillary, one or two, rarely three, blooms developing in the axils of the upper leaves. The bell-shaped corolla is white, more or less flushed with rose. Besides providing a useful plant for the pleasure grounds, R. oleifolium is a distinct addition to the rock garden. *A. O.*

FIG. 157.—RHODODENDRON OLEIFOLIUM; A NEW CHINESE SPECIES WITH ROSE-COLOURED FLOWERS.

THE BULB GARDEN.

COLCHICUM BORNMUELLERI.

APART from its name, the Meadow Saffron of this name is one of the most desirable of all the Colchicums, and July is perhaps the best time for planting it, if the bulb dealers can supply it, as some of them can. August is not too late even for blooming this autumn, and I have planted it in September or October, but in that case a season's flower is lost. One may have flowers, but they are not so good, as top-growth has generally commenced by that time and the root-growth is absent until later, if the plants have been kept out of the ground. If planted in July or August, root-growth takes place at the proper time and the flowers appear in their natural season. This is in September. The blooms of C. Bornmuelleri are large, nearly white, when they first come through the ground, passing off gradually to purple. A nice clump of this Meadow Saffron is charming in the border during the autumn months. Some have considered Bornmueller's Meadow Saffron a form of C. speciosum, but the present writer is not of that opinion. It is of different form and has other points of difference. *S. Arnott.*

The Week's Work.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Cucumbers.—The long spell of bright weather has helped the plants to make rapid growth. Those fruiting freely will require a considerable amount of nutriment, otherwise they will quickly become exhausted. Where space permits, top-dressings of rich compost should be applied at frequent intervals to encourage quick root action; if space is lacking, apply a good mulch of old mushroom-bed manure, or well-rotted cow-dung. The stopping and tying of the shoots will require constant attention; all weakly and exhausted growths should be promptly removed to prevent overcrowding. Certain varieties often show three or four fruits at a joint, and in such cases a certain amount of thinning is advisable to prevent undue strain on the plants.

The Muscat Vinery.—On vines which were started in the early part of the year, the Grapes will now be colouring and it is at this stage they are apt to scald from sun-heat or when exposed suddenly to bright sunshine. Later, when colouring is well advanced, more sunlight will be helpful in securing that rich golden tint so generally admired in Muscat Grapes. If specially required, colouring may be hastened by tying back any leaves which shade the bunch, and then placing over, and well clear of, the bunch, a sheet of white tissue paper, tying it securely in position. Muscat Grapes will perfect their colour under the shade of the foliage without any special aid if allowed to advance steadily and remain on the vine until they are ripe. A slight coat of shading applied with a syringe, or a fish-net doubled, and drawn over the roof-glass will prevent scalding of the foliage or berries. Air should be freely admitted when the weather is favourable, though, unlike black Grapes, Muscats do not benefit to the same extent from the ventilators being opened at night. With the exception of the latest Muscat Grapes it will be easy to see at this date which of the berries are stoneless, and as these disfigure the bunches by their small size, they should be removed. If hot weather continues, damp the paths and walls frequently and keep the borders moist. If the borders are well filled with roots, apply a dressing of a suitable artificial manure or give liquid manure when supplying moisture.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Pansies and Violas.—Young plants raised from seeds sown some weeks ago will require every care and attention to keep them growing sturdily and free from mildew. Place a liberal mulching amongst the plants, and afford ample supplies of water during dry weather. Seeds may still be sown in the open to provide a further stock of plants. Sow thinly in shallow drills on good soil that has been previously well watered. As soon as the seedlings are large enough, thin them out, and transplant the thinnings in well-prepared beds, allowing a distance of nine inches between the rows and six inches between the plants.

Lily of the Valley.—To ensure the production of large spikes do not neglect the requirements of Lily of the Valley. Thoroughly soak the plot with liquid manure at intervals, especially if the soil is light, and keep the beds free from weeds.

Hollyhocks.—These plants may be raised from seeds sown in the open, and from a sowing made now sturdy young plants should develop by the end of the season. Prepare drills two inches deep and twelve inches apart, on a south border. Sow rather thinly, and if the weather is dry water the drills before sowing the seed and also the bed

after sowing. Thin the seedlings early and encourage the plants to make robust growth. Both single and double varieties provide a good display as back row plants in borders, and are useful in any spot where tall plants are required.

Briars.—Remove superfluous shoots, water the roots thoroughly, and afford a mulch if the weather keeps dry so that the bark may part freely from the wood when the work of budding is being carried out.

Ferneries.—In most gardens there are sites on which hardy ferneries could be constructed. A good collection of suitable hardy kinds and varieties of Ferns forms a very interesting feature. Shady sites should be chosen, and every preparation made prior to planting. Old established plants will need attention and abundant supplies of water in dry weather.

Malope trifida grandiflora.—The rose and white forms of this Malope are very useful, both for planting in borders, or in beds for supplying cut flowers. They need plenty of water at the roots, and an occasional supply of liquid manure.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Thinning Gooseberries.—Gooseberry bushes often carry more fruit than they can properly mature, therefore the crops should be thinned as soon as the berries are large enough, and the thinnings made use of either for cooking at once or for bottling. The thinnings also make excellent wine. The berries should be crushed; eight gallons of Gooseberries and six gallons of water will make twelve gallons of wine. Allow the liquid to ferment for a fortnight, strain it off and add 16 lb. of sugar and 1 oz. of citric acid. Brandy may be added, but this is not necessary. After the sugar is dissolved the liquid should be put into a barrel, filling it to the bung-hole but not corking it down until fermentation ceases.

Red Spider on Fruit Trees.—As a consequence of the hot, dry weather experienced, red spider has become a troublesome pest. The remedy for it lies in heavy waterings, forcible syringings and a free use of fertilisers. I also find that syringing with weak and clear liquid manure keeps the pest in check, but it must not be strong enough to harm the foliage. Red spider cannot thrive on plants that are syringed or hosed regularly.

Hoeing in Fruit Plantations.—The hot weather has been very helpful in clearing plantations of weeds where hoeing has been practised. Hoeing is also valuable in keeping the ground from cracking and preventing the escape of moisture.

Raspberries.—Where extra fine fruits are required only the strongest and best Raspberry canes should be allowed to remain; cut back the others, and as soon as the fruits have set they should be thinned. To obtain berries of the largest size, the plants should be well fed and watered. Raspberries should also be well mulched and watered with weak liquid manure.

Outdoor Vines.—The shoots of vines grown out-of-doors should be tied as they develop. Remove superfluous growths and stop all shoots not required to fill vacant spaces at three or four joints behind the bunches.

Earwigs.—These pests are very destructive to fruits, especially Apricots and Peaches, and they often spoil them by eating the skin whilst it is green. The recent hot weather has been favourable to earwigs as they like dry conditions and will harbour in any dry place. They generally hide in the daytime and feed at night, but they may be easily trapped by means of hollow canes or hollow stalks of any kind cut into 6-inch or 10-inch lengths and placed flat amongst the tree branches. These traps should be examined every morning and the insects shaken out into hot water or insecticide. Another method is to lay small flower pots, with a little dry moss or hay inside, on their sides near the trees.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Vanda teres.—This is a lovely Orchid, and one that flowers freely at this time of the year when well managed. During the growing season, which follows as soon as the flowering period is over, the plants revel in abundance of sun-heat, light and moisture. They should be shaded only during the very brightest part of the day, and then but very slightly. The work of repotting, or surfacing, should receive attention soon after flowering is over. It is a good practice to grow the plants on long upright rafts of teak rods, plunging the base of the raft in clean crocks surfaced to the depth of two or three inches with chopped, live Sphagnum-moss. If the rod-like stems are placed in the moss the plants will soon attach themselves to the rafts, as they make aerial roots freely. Vanda teres should be grown close up to the roof glass, and be frequently syringed to encourage free, rapid growth. When the growing season is over, the temperature of the Cattleya house is best for the plants, and they should then be kept quite dry at the roots.

Bulbophyllum. — The Bulbophyllums are mostly kept as curiosities. The majority of the species are easily grown in teak baskets or small, shallow, well-drained pans. The plants should be placed on a cone of rooting material, consisting of good Osmunda fibre and fresh Sphagnum-moss, chopped and well mixed. They should be grown near the roof glass and be shaded from bright sunshine, but should have plenty of light. Liberal supplies of water will be necessary during the season of growth, and at no period should the roots be entirely deprived of moisture. Plenty of heat and moisture is requisite for them, but during winter, when the plants are at rest, slightly cooler conditions should prevail, though they should at no time be subjected to a very low temperature.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Winter Greens.—Large breadths of the various kinds of winter greens should be planted out before they become too hard in the stem. Choose several positions, planting the later and hardier kinds and varieties in the more exposed parts of the garden. If rain does not follow the planting give the plots a thorough watering immediately. The distance apart at which to plant must be governed by the kinds planted, the large-growing Borecoles should be planted two feet apart each way, Savoys 18 inches apart, and the various Broccolis 2 feet. Plant firmly.

Coleworts.—Make a sowing of Coleworts. The seedlings will make satisfactory progress provided they are firmly planted out so soon as ready. By that time good ground will be vacant and available for this indispensable vegetable.

Chicory.—Make a sowing in light and well pulverised soil in drills, 15 inches apart. Water freely if necessary and ply the Dutch hoe frequently between the rows. Thin the seedlings to 9 inches apart.

Spinach.—To maintain a constant supply of Spinach make sowings every ten days in well watered drills in shady parts of the garden.

French Beans.—As the weather has been so very hot and dry extra sowings of French Beans will be necessary, to maintain an unbroken supply of tender pods. Sow the seeds in well manured ground in drills 18 inches apart, and thin the plants to 1 foot apart. Keep the roots moist and damp the foliage daily, during the evening. Superlative, Canadian Wonder and the Dwarf Butter Bean are useful varieties.

Peas.—Make further sowings of Peas in trenches, as previously advised. Stake and mulch the plants as they need these operations, and encourage free growth by regular waterings and overhead sprayings during the evenings. The haulm from the early crops of Peas should be cleared off to prevent mildew appearing and to make room for the planting of Cabbages and early Savoys. All the preparation needed for these later crops is hoeing the surface soil and a dressing of burnt earth or wood ash.

Potatos.—All Potatos should have been earthed up by this date; but deficiency in the ridges should be made good, and rogues, or sickly-looking plants pulled up and burnt.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Zonal Pelargonium.—Early rooted plants will now be ready for shifting into 7-inch pots. Use clean, well-drained pots, and a compost of three parts turfy loam, one part leaf-mould, and a 6-inch potful of a plant fertiliser to each barrowful of soil. Water the roots before repotting, pot firmly, and then there will be no necessity to afford water for several days afterwards. Place the plants in a cool, airy house, or in a cold frame, on an ash base, where they may be fully exposed to sunshine. In preparing Zonal Pelargoniums for winter blooming, the plants require special treatment; after being potted, they should be plunged in ashes to the pot rim, out of doors, in a position fully exposed to the sun. This will cause the growth to be short jointed. Remove all flowers for the present.

Carnations.—Malmaison and other large flowering Carnations growing in 7-inch pots should be shifted into 10-inch pots, with the view, as two-year-old plants, of furnishing a large quantity of flowers. Select for this purpose plants furnished with a number of strong growths, and to prevent them being broken in the process of potting, tie them securely to stakes before the work is commenced. The soil for this potting should consist of a mixture of three parts rich loam, and one part each of leaf-mould, coarse sand, and wood ash, adding a 7-inch potful of Carnation manure to each barrowful of the mixture. Pot firmly, place the plants in a cool house, and shade them from bright sunshine. Give the roots a good soaking with water and keep the path and walls damp. When the plants have rooted well in the fresh soil, give abundance of air, and spray the growths occasionally with an insecticide.

Chrysanthemums.—The nature and preparation of the soil for the final potting of Chrysanthemums are important details. Heavy and retentive soil should be passed through a sieve, and the fibrous portions retained for potting; add to this material some charcoal, wood ash and sharp sand. A soil of medium texture is best mixed with leaf-mould, charcoal and a 7-inch potful of plant fertiliser to each barrowful of the mixture. Use clean pots, well drained, and place rough pieces of the soil over the drainage. Stake the plants securely. If the soil is light it is difficult to pot the plants too firmly. Select a piece of ground where the whole of the Chrysanthemums may be placed together, cover the site with a sprinkling of coal ashes, and erect posts and wires to which the plants can be safely secured. Watering should be done carefully. To destroy aphis dust the foliage with tobacco powder.

Coleus thyrsoideus.—This is a useful blue, winter-flowering plant. Cuttings inserted now will produce the strongest and best plants for next winter. Insert the shoots in pots filled with sandy soil and place them under hand lights or in a propagating frame. As soon as they have rooted afford more air, and when sufficiently rooted pot them singly into small pots, and place them on a shelf near the roof-glass, subsequently shifting them into 4-inch pots, and finally into 6-inch pots, using a compost of good loam, some peat, sand and a little artificial manure. Grow them in a warm house, but admit plenty of air on hot days, closing the house and affording plenty of atmospheric moisture in the afternoon. Keep them sufficiently watered at the roots, and when fully established in their flowering pots feed them with liquid manure.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, JULY 1:—

Royal Horticultural Society's Committee meeting; lecture at 3 p.m. by Dr. E. J. Russell on "Soil Sickness and Soil Sterilisation." (Lantern slides.) National Sweet Pea Society's Exhibition at the London Scottish Drill Hall, Westminster, to be followed in the evening by the Annual Dinner at the Holborn Restaurant, London, W.C.

Meeting to be held at the Caxton Hall, Westminster, on the "System of Cheap Transport," at 8.30 p.m.

WEDNESDAY, July 2:—

Exhibition at Chelsea Hospital Gardens, on behalf of St. Dunstan's Institution for Blinded Soldiers (two days).

National Rose Society's Metropolitan Exhibition, at the Royal Botanic Gardens, Regent's Park, N.W.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 61.7°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, June 25, 10 a.m.: Bar., 30.1; temp., 63°. Weather—Dull.

Versailles. At this moment the dénouement of the world's great war drama is being reached at Versailles. No place could have been better chosen, for apart from historical consideration, its gardens are a fit setting for Peace. For as Mr. Truffaut reminds his readers* the gardens at Versailles represent the triumph of the peaceful arts over the savagery of Nature. We have it on the testimony of Saint Simon that before the site was transformed into a garden it was one of the saddest and most desolate of places —with no view, no woods, no lakes and no soil except sand or marsh.

Under successive monarchs—Louis XIV., Louis XV., and Louis XVI., the estate of 30,000 acres was acquired and developed at a cost of upwards of two million pounds. So long ago as 1624, the first little chateau was built by Louis XIII. as a hunting box, and part of it still remains in the marble court of the present chateau.

It was in 1669 that Le Nôtre, the great French gardener, began his work on the park and gardens, and from 1679 to 1688 their construction proceeded apace under his direction and with the aid of 36,000 workmen. For the planting, trees were brought from all parts—Limes and Elms from Flanders, Pines from the Dauphiné, pyramidal Yews from the forests of Normandy, and no fewer than 25,000 trees of various kinds were transported by road to Versailles from Arras. Whilst this work was in progress the first "garden city" was laid out at Versailles, and its three great avenues planted with Elms. Nearly 100 years later—in 1775—many of the trees planted by Le Nôtre had become so overgrown and decayed that they had to be cut down and the ground freshly planted, which was done under the influence of the English style then becoming fashionable in France. The Bains d'Apollon, for example, date from this period. In its turn, this later planting of the latter part of the 18th century suffered the inevitable fate which attends old age, and again, in 1860-1875, Versailles was replanted with trees, so that the specimens now ornamenting the park are generally only 40 or 50 years old. The Trianon Gardens, which date from 1688, were planted with specimens from all parts of the world; from Constantinople and Persia, Narcissus, Hyacinths, and Irises were brought. Under Louis XV. and the Marquise de Pompadour the Trianon became a home of intensive agriculture and horticulture—model dairying, poultry keeping, and market gardening. At this time also—in or about 1755, Claude Richard built at Trianon hothouses, until then very rare in France. In 1758 the celebrated Botanic Garden was established for the study of the plants. In it, Bernard de Jussieu developed his classification of plants in natural families, a work which, perfected by his nephew, Antonie-Laurent de Jussieu, resulted in the immortal work, *Genera Plantarum*, published in 1789. Of Claude Richard, Linnaeus said that he was the ablest gardener in Europe.

A large part of the Botanic Garden was destroyed by Marie Antoinette in order to make room for the "English Garden" of the Petit Trianon. Richard, however, found places in Versailles for most of the valuable plants, and, moreover, all kinds of new plants were introduced — Sophoras, Cedars, Weymouth Pines, Larches, Golden Cypress from Louisiana, American Oaks, Tulip trees and Gingko from China were all planted at Trianon.

Under the Revolution, when the caprice of monarchs gave place to that of democracies, the parks of Versailles and Trianon were saved from destruction by Richard, who showed his resource and adaptability by deferring to the utilitarian spirit of the time and planting Potatos and fruit trees in the borders most exposed to public view—a pioneer work of cultural camouflage! Yet later, in 1917, the garden of kings became again a place of Cabbages, which, with Leeks and other vegetables were distributed for planting the French Army gardens. Once again, after the Revolution, neglect fell upon Versailles. Napoleon did not love it, but again the gardens won, and in 1850 they were restored and their reinauguration celebrated by a fête attended by Her Majesty Queen Victoria. It is to be hoped that with peace may come the determination to restore the gardens of Versailles once again to their former state of beauty. They have survived the vicissitudes of centuries, they are associated with the grandeur and tragedy and progress and reaction of a great nation; they are, as it were, a mirror in which not only the present, but the past also is reflected. May they become once again rivals of their own proudest epochs, and in their renewed beauty become a symbol of the triumph of peace over war.

* *Jardinage*, May, 1919.

New Parks' Superintendent at Burnley.—The Parks Committee of the Burnley Corporation have appointed Mr. E. C. Paiton as Parks Superintendent, in succession to the late Mr. Murray. Previously, Mr. Paiton was for eleven years in charge of Scott Park, where he rendered valuable service to the Burnley Corporation, in whose employ he has been for over twenty-five years. He has a wide and varied experience in the laying-out of parks, bowling greens, tennis courts and private gardens, and an unique knowledge of carpet bedding and display work. Scott Park, during the summer months, having always been an excellent testimonial to his abilities in these directions.

National Rose Society's Metropolitan Exhibition.—The summer show of the National Rose Society will be again held this year in the Royal Botanic Gardens, Regent's Park, the date fixed for the Exhibition being Wednesday, July 2.

French Horticulture and the War.—At the meeting of the Association of Old Scholars of the Versailles National Horticultural College, held at the beginning of June, the names were read out of those scholars or old scholars who had been killed in the war. The names numbered one hundred and eleven.

Eastern Counties Commercial Fruit Show Committee.—At a meeting of the Committee of the Eastern Counties Commercial Fruit Show, Mr. F. Glenny was elected chairman and Mr. G. W. Leak vice-chairman. It was decided to hold the Show at Cambridge, in the Corn Exchange, on November 5th and 6th. The schedule of prizes is a long one, and includes classes for most types of packing. There is also an interesting class for the different associations in the Eastern Counties. This class consists of 12 market packages composed of 6 varieties of Apples. It is proposed to hold a Conference in conjunction with the Show, but the details are not yet decided upon. Schedules may be had from the Secretary, Mr. Charles Wright, 2, Huntingdon Road, Cambridge.

Allotments at Lewisham.—The Lewisham allotment holders are seriously perturbed over the proposal of the Borough Council to take over an 11-acre field of allotments, which have been held for thirty years, for the purpose of a housing scheme. A protest meeting, held on Sunday, June 1st, was attended by about 500 plot-holders and was addressed by the President, Chairman, Secretary and Treasurer of the Lewisham Horticultural Society, and by Mr. Alfred Smith. Resolutions were passed urging the Council to build in the Southend part of the borough, where there is an extensive area of agricultural land, and thus leave this solitary field as a "lung" for an already populous district.

Kew Gardeners and the War.—We are informed that fifty journeymen gardeners enlisted in the services from Kew, and that of this number ten were killed during the war. Their names are C. H. Anderson, J. C. Beswick, C. H. Brown, W. Clark, J. Divers, G. Farries, J. K. Jackson, H. J. Longhurst, A. J. Meads and J. N. Winn. Of those who survived, eighteen have returned to their old posts at Kew, the others having either found employment elsewhere or have not been demobilised. We are also informed that the pre-war conditions for journeyman gardeners with respect to lectures, etc., are again in operation, and that the hours are now from 6 a.m. to 5 p.m. in summer, and from 8 a.m. to 4.30 p.m. in winter, with two out of every three Saturday afternoons free. The wages have been increased to 53s. per week, and payment for Sunday duty is at the rate of 1s. 8d. per hour. An important concession has been made with respect to the age limit (19 to 24) for fresh applicants, the period of War Service being deducted from age, so that a gardener who is 27 and who served four years in the Army would be eligible for employment at Kew.

Sale of Orchids in U.S.A.—A sale of Orchids belonging to the late Mr. Charles G. Roebling, in the United States of America, realised the equivalent of £5,700. Mr. Roebling was president of the company that built Brooklyn Bridge, and he made a hobby of growing Orchids. His collection was particularly rich in species and varieties from the Samoan Mountains, though he also sent collectors to various other places in search of novelties. Altogether, he cultivated more than 700 distinct species and varieties, which were said to have cost him several hundred thousand dollars.

Mr. C. F. McNab.—The many horticultural friends of Mr. Jas. McNab, for a considerable number of years representative of Messrs. Sanders, St. Alban's, and now of Messrs. Armstrong and Brown of Tunbridge Wells, will regret to learn that his wife died on June 18 at their residence, Upper Grosvenor Road, Tunbridge Wells. Mrs. McNab was the elder daughter of Mr. W. Orrin, of St. Alban's.

French Chrysanthemum Society.—It is nearly five years since the above Society ceased active operations. A meeting of the Executive recently held in Lyons decided to revive the Society which, if possible, will organise an annual congress as in days gone by. This will be held, it is hoped, in the month of November next in conjunction with the Paris Autumn

FIG. 158.—VIEW IN THE PARK OF THE LITTLE TRIANON, VERSAILLES (see page 319).

Exhibition. The Society's monthly publication, *Le Chrysanthème*, the last issue of which was dated July-August, 1914, will reappear as from the present month. Various changes in the executive, due to death, have unfortunately taken place, but M. Ph. Rivoire, 16, Rue d'Algerie, Lyons, still holds the office of Secretary.

Potato Spraying.—Growers of Potatos are advised by the Board of Agriculture to make provision at once for the spraying of their crops. The hot, dry weather, though it may have checked further growth, is bound to hasten the maturing of Potatos, hence it is probable that blight will make its appearance in the main-crop varieties earlier than in normal years, the more so if moist weather follows. Should the late summer be wet, the disease is likely to prove even more serious than usual. An approximation to the following dates for the first spraying of second early and main crop Potatos will probably be found satisfactory. June 15 to end of June: Cornwall, Devon, Dorset, Isle of Wight and Hampshire, Somerset, and S.W. Wales. July 1 to July 8: Glamorganshire, Gloucestershire, Monmouthshire, N.W. Wales, Sussex, and Wiltshire. July 8 to July 15: Berkshire, Herefordshire, Kent, Oxfordshire, Surrey, and Worcestershire. July 15 to July 31: remainder of the country. In the North-Eastern counties spraying should usually be deferred until the last week of July. The second spraying should be done about three weeks after the first. This will serve to cover the new foliage and to protect more completely that already sprayed. In the South-West of England it will often be found advisable to spray a third time; and this applies also to other districts in wet seasons when heavy rains are frequent.

Conducted Tours at Kew.—In September, 1914, the officially conducted tours of Kew Gardens, Plant Houses, and Museums, were discontinued; on Monday, the 23rd inst., they were resumed. The conductor is Mr. Ryan, who has for some time past worked in the Kew Herbarium, and was previously in the Indian Forestry Department. Two tours are made daily, Sundays excepted, commencing in the morning at 11.30 a.m., and in the afternoon at 3 p.m., except during June, July and August, when the afternoon tour commences at 5 p.m. The charges are 6d. in the mornings, and 3d. in the afternoons. Applications, in writing to the Director, to be included in a tour on a particular day, have priority, if the authorised number for a party is exceeded. Visitors meet in the garden of Cambridge Cottage shortly before the time at which the tour is advertised to commence.

Eelworm Disease in Daffodil Bulbs.—We learn on the authority of Mr. J. K. Ramsbottom that if Daffodil bulbs are immersed in water warmed to 110°F. for five hours (see page 270), the eelworms will be killed, but the bulbs may be killed also, under such prolonged treatment. Three hours appears to be the proper period of immersion for effectually disposing of the eelworms without damaging the bulbs.

Presentation to Mr. James Hudson, V.M.H.—On the occasion of his retirement from the charge of Gunnersbury House Gardens, Mr. James Hudson was, on the 21st inst., the recipient of two handsome presents, one from Mrs. Leopold de Rothschild, inscribed "As a remembrance of many years," the other from Mrs. Arthur D. Sassoon as "A souvenir, with her best wishes." Mr. Hudson carries with him into his retirement from active service the best wishes of horticulturists everywhere, and the esteem and pride of his fellow craftsmen, for the good work he has done, not only in ennobling the profession of gardening by his abilities and example, but for the interest he has shown in gardening charities and other good works with which he has been so long and honourably associated.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Variability in Plants (see pp. 251, 285, 299, 308).—Since I wrote my previous notes on this subject I find an old record of the occurrence of three cotyledons on dicotyledonous plants. When making the record I had found three cotyledons in Lime, Sycamore, common Ash, Streptocarpus Rexii floribunda, S. pauciflorus, Chirita acuminata, Mimulus luteus, M. cupreus, Orphium frutescens, Oenothera bistorta, O. tenella, O. quadrivulnera, O. Sellowii, O. rosea, Trichosanthes Anguina. Limonia acidissima, Melilotus leucantha, Geum coccineum and Aquilegia Stuartii. Occasionally the cotyledons of Limonia were alternate or verticillate in threes. In Trichosanthes the first two leaves were opposite, rarely alternate or three in a whorl. I have acted on the suggestion of E. Judson Sage (p. 308), to see what the least common multiple of the number of parts in leaves and flowers would elucidate, but find somewhat conflicting evidence. The normal form of the British Paris quadrifolia has 4 leaves, 4 plus 4 parts to the perianth, 8 stamens, and an ovary of 4 carpels. The least common multiple of these numbers is 8. I have a specimen with 7 leaves, and four having 5 leaves each. The first shows 7 leaves, 4 plus 4 parts to the perianth, 7 stamens and 4 carpels. The least common multiple in this case is 28. In the normal form of Veronica Teucrium dubia (syn. V. rupestris) there are 2 opposite leaves, 4 sepals, 4 lobed corolla, 2 stamens, and 2 carpels. Here the least common multiple is 4; but 5 sepals are often present, giving 20 as the least common multiple. I am of opinion that the parts of a flower can vary independently of one another, and the leaves independently of the flowers. The lower leaves of most, if not all Veronicas are opposite, but the upper leaves or the bracts are alternate. The leaves of V. paniculata, V. longifolia, and some others I have seen, are opposite or in whorls of three; while those of V. virginica are in whorls of three to nine. Presumably the flower of a Veronica represents the suppression of one sepal, one petal, three stamens, and three carpels, as we find all the five parts present in Verbascum, except in the case of the carpels. *J. F.*

The Garden Chafer (see p. 308).—The remarks by Mr. Divers on this destructive pest were very interesting. Here, on the Surrey hills, we have experienced a plague of the June bug, as we know the insect, for two seasons. Last year it attacked the Apples and Pears in swarms, as many as 200 being shaken from four-year-old Apple trees on to mats smeared over with tar. On the first appearance of the chafer last season I sprayed our Apple and Pear trees with arsenate of lead, repeating the application after about three days, but unfortunately in that little time the insects had done an immense amount of damage. I found after the second spraying they soon left the sprayed trees and attacked a plot of Raspberries close by, practically devouring every leaf. Another orchard of young standard trees was not sprayed owing to labour shortage, and the pests flocked to these. In a day or two I noticed swarms of starlings settling on these trees, and, to my surprise, they practically cleared the trees of the pest. About the last week in May of this year the pests again returned, but this time I had forestalled them, and had most of the trees previously sprayed twice, and these they left severely alone, but not so trees sprayed once only. I think Mr. Divers puts it rather mildly when he states that the attack is chiefly on the foliage; unfortunately, last year the insects turned their attention to the fruit when the latter were about the size of Gooseberries, and after ruining the crop devoured the foliage. During the continued drought this season the June bug has attacked Roses, but I have not yet found them damaging the Rose foliage. Phyllopertha horticola seems to infect certain places around this district, yet I know of others not six miles distant where the pest has not yet been seen. *H. Prince, Dorking.*

SOCIETIES.

EXHIBITION IN AID OF THE WAR HORTICULTURAL RELIEF FUND.

JUNE 24, 25 and 26. In the sacred cause of charity the horticultural trade has never been found wanting, consequently it was no surprise to find an extensive show at Chelsea on the above dates in aid of the Horticultural War Relief Fund which the Royal Horticultural Society is raising for the purpose of assisting French, Belgian, Serbian and Roumanian horticulturists whose gardens, nurseries and vineyards have been devastated by the German soldiery during the war. In addition to the attractions of the show, there were considerable contributions of flowers for sale on behalf of the fund, and the members of the British Carnation and National Sweet Pea Societies made splendid contributions of blooms, while various traders gave plants, and Messrs. G. Monro, Ltd., gave a large and valuable consignment of home-grown and foreign fruits.

Besides these attractions and gifts there were stalls for the sale of flowers, fruits, vegetables, Strawberries and cream, whereat society ladies and famous members of the theatrical profession, under the leadership of Lady Newnes, dispensed things at goodly prices.

The show as a whole was a fine one, but there were few novelties and a lack of that horticultural enthusiasm which marks the great Chelsea and Holland House exhibitions. It was unfortunate that the weather was distinctly cold, and still more unfortunate that during the gale on the 23rd inst., about 4.30 p.m., the large tent had its ends torn to ribbons by the wind, and then, the wind getting underneath, the huge canvas erection was ripped and brought to the ground. Fortunately, no one was seriously hurt, but it was a tragedy none the less, because beautiful plants and flowers were overturned by the lashing canvas, knocked about by the swinging side poles, and finally pressed down by the collapsed tent. Many days' work was spoiled in a few moments, and we sympathise greatly with those whose exhibits suffered, with Mr. Bissett, the show superintendent, all those who had worked hard to make the fête a success and who must have had a very bad quarter of an hour after the tent came down, because they feared the other tents, now open to the force of the wind, might collapse also. However, all's well that ends well, and we trust in our next issue we may have the pleasure of recording a splendid addition to the War Relief Fund.

Orchids.

In the large tent the side stages were effectively filled by the Orchids, the exhibits being quite equal to those at the previous Chelsea display, though fewer in number. Five exhibitors staged excellent groups varying from twenty to forty feet frontage, and all remarkably well arranged with graceful Palms forming the background.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. J. Collier), staged a very fine group with his famous forms of Dendrobium illustre at the back, the centre being of handsome Cattleyas and Laelio-Cattleyas arranged with Odontoglossums, and the sides mainly of Miltonias and richly-coloured Odontiodas. At the ends were selections of curious species, including the quaint Nanodes Medusae, the slender white Platyclinis cornuta, the elegant orange Physosiphon Loddigesii and the very remarkable dark green Lycaste Locusta. Specially fine plants were Odontoglossum Lambardeanum Gatton Prince, one of the largest and most richly-coloured Odontoglossums, two of the charming white and purple Cattleya Isabel Sander Gatton Park variety; Coelogyne pandurata and C. burfordiense.

Messrs. CHARLESWORTH & Co., Haywards Heath, had one of the largest and best groups, the centre being of Laelio-Cattleyas arranged with pure white " xanthotes " forms of Odontoglossums, with some noble specimens of Laelio-Cattleya Aphrodite in front. The sides were mainly of the famous Miltonia Lyoth, including very handsome M. Charlesworthii, still the best. The ends were of scarlet Odontiodas and handsome hybrid Odontoglossums, a good selection of which, flowering for the first time, were also arranged in the front line. Special novelties were the new Cattleya Hentschelii (Warscewiczii × Dupreana), with noble flowers superior to both parents, the broad sepals and petals being bright rose and the lip purplish crimson with a light yellow, bilobed disc as in C. Warscewiczii; and Odontonia Corona (Miltonia Warscewiczii × Odontoglossum Harryanum), with chocolate purple sepals, petals with pale green tips, and a white lip with a ruby-red basal half. Effective species were the scarlet Habenaria rhodocheila and the bue Vanda coerulea.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, staged a very fine and effectively-arranged group, the centre of which was filled with Cattleya Warscewiczii, with spikes bearing six flowers, each arranged with white Odontoglossum crispum, and rose and purple forms of Laelio - Cattleya Aphrodite. The sides were of showy Miltonias with white Cattleyas and hybrid Odontoglossums, and the ends of scarlet Odontiodas and showy hybrid Odontoglossums. Specially fine things noted were Odontoglossum Victory The Baroness, illustrated in *Gard. Chron.* May 4, 1918 (Fig. 81), p. 184, and still maintaining its reputation as the best of the section; Miltonia Princess Mary, chaste in tint and fine in form; the famous M. J. Gurney Fowler, and others flowering from the same batch of seedlings; two fine white Cattleya Mendelii, and the large scarlet Orchidhurst variety of Odontioda Madeline.

On the other side of the tent Messrs. STUART LOW & Co., Jarvisbrook, Sussex, had a fine group, the centre of which included Laelio-Cattleya Aphrodite, L.-C. Canhamiana and L.-C. Dominiana, and the elevated ends of scarlet Odontiodas and Renanthera Imschootiana arranged with the large pure white Moth Orchid, Phalaenopsis amabilis Rimestadiana, now very scarce. The central areas were well arranged with splendid forms of Cattleya Mendelii, both white and dark coloured, and various showy Dendrobiums and other good species. Messrs. MANSELL & HATCHER, Rawdon, Yorks, had a very effective group, the centre front being of many snow-white forms of Cypripedium niveum and some closely-allied hybrids of it, each bearing the minute purple spotting of the type. The forms of Laelio-Cattleya, and hybrid Cattleyas arranged with Vanda teres, and the orange-red hybrid Laelias contrasted pleasingly with the many richly-coloured Odontiodas and Odontoglossums displayed with them.

Several Orchidists sent supplies of cut flowers, which greatly assisted in the department arranged for their sale.

Roses.

Mr. ELISHA HICKS's exhibit of Roses was a particularly fine one, and consisted of tall pillars of Rose blooms, rising six feet or so above the low bowls and stands of fresh, bright blooms. Quite naturally Mr. Hicks showed his varieties, Joanna Bridge, Mrs. Elisha Hicks, Chas. E. Shea and Princess Mary, largely and well, but in addition to these he had beautiful stands or pillars of American Pillar, Cupid, Diabolo, Joseph Leger (a very double, cream-white Wichuraiana variety), Mrs. C. Sawday, Seagull, Mrs. O. G. Orpen, Jersey Beauty, Mme. E. Herriot, moschata alba and Danae. Messrs. G. and W. BURCH were exhibitors of Roses, and showed stands and boxes of exhibition blooms of Gorgeous, Miss Willmott, St. Helena, Mrs. Foley Hobbs and others.

Messrs. A. DICKSON AND SON brought over a charming lot of Irish grown Roses, and contributed a brilliant exhibit in which the chief effect was produced by large stands of K. of K., Sunstar, Irish Fireflame, Red Letter Day, Elizabeth Cullen, Chrissie MacKellar, Lady Hillingdon, and Lady Pirrie. Rev. J. H. PEMBERTON showed a very attractive group of Roses, in which his new Star of Persia was the most conspicuous variety; Pax and Moonlight were shown in fine condition among other good things.

Messrs. CHAPLIN BROTHERS staged a central sheaf of over a hundred lovely flowers of the new cream-white H.T. Rose Edith Cavell, in their group of Roses. Paul's Scarlet Climber, Ophelia, Lady Pirrie and Red Letter Day were other varieties admirably shown. Messrs. B. R.

CANT AND SONS presented a large bank of Roses, and made a feature of Flame of Fire, Golden Emblem, Iona Herdman, Covent Garden, Henrietta, and other bright hued varieties.

Flaming Zep is the name given by Mr. T. P. EDWARDS to a bright orange buff Rose, a sport from Mdme. E. Herriot that was noted just after the German Zeppelin was brought down at Cuffley by Captain Robinson. It is a handsome Rose, and apparently very free.

Carnations and Sweet Peas.

The British Carnation Society, evicted by the gale from their proper stand, nevertheless had a fine display of Carnations and Lilies, sent for sale by the leading members including a fine consignment from the President, Lord Howard de Walden, arranged by the Misses Page and Mr. Brunton. Messrs. STUART LOW AND CO. arranged Carnations in great variety in low bowls and suitable vases, and showed Matchless, Red Ensign, and Circe in good style, as well as the Malmaison variety, Hon. Charlotte Knollys.

Mr. C. ENGELMANN made a large contribution of Carnations, and conspicuous varieties in his large collection were Coquette, Scarlet Carola, the yellow Saffron (described and figured in *Gard. Chron.*, p. 271, Fig. 135), Carola, Snowstorm, and Circe. Considering the flowers were previously under the collapsing tent, they made a fine display.

The National Sweet Pea Society, also disturbed by the wreck, still put up a grand lot of flowers, sent by the leading trade and amateur growers. Fortunately, only one glass vase was broken when the tent collapsed, so Mr. Tigwell and Mr. Allen set to work and put up a first-rate display in another tent. In the exhibit of Sweet Peas from Mr. ROBT. BOLTON the leading varieties were Prince George, Ivorine, R. F. Felton, Gold Medal (a rich cream pink), Magie, the brilliant Verdun and the glowing and well-named Tangerine.

Greenhouse Stove Plants.

Messrs. JAS. CARTER AND CO. were not behindhand on this occasion; they filled one end of a large tent with a gorgeous exhibit composed of rounded masses of splendid Gloxinias and Sweet Peas, with smaller groupings between and in the foreground of the vivid Viscaria cardinalis, Petunia Queen of Roses and Primula obconica. The Sweet Peas were finely grown and beautifully staged—as one expects to find everything from Raynes Park—but the Gloxinias, in their variety of colouring, and excellence of form and freedom of flowering, formed the chief attraction.

Stove foliage plants were largely shown by Mr. L. R. RUSSELL, who filled a large rectangular space with Caladiums, Dracaenas, Crotons, Aralias, Calatheas, Palms, Ficus and other elegant and bright-hued plants. Some Anoectochilus and the bright berried Nertera depressa were also used in the foreground. Mr. L. R. RUSSELL also had a brilliant exhibit of finely-grown plants of Crassula coccinea, Hydrangeas, Fuchsias, Linums, Roses and Marguerites. Messrs. WEBB AND SONS' exhibit of Begonias and other plants and flowers was demolished in the disaster which overtook the large tent.

One of the most brilliant exhibits was a large one of the new seedling Pelargonium Victory, a very bright salmon variety raised by crossing King of Denmark with Paul Crampel. It is a sturdy grower and carries large, dense trusses of single flowers. The exhibitors were Messrs. W. S. WATNEY, LTD. Messrs. H. B. MAY AND SONS were among the worst sufferers, and were only able to re-arrange a small portion of their display of Ferns, Pelargoniums, Verbenas, Hydrangeas, and Salvias after the disaster.

Messrs. J. PEED AND SON's exhibit consisted entirely of Gloxinias set in a groundwork of Maidenhair ferns. This firm has a capital strain of these popular and decorative plants. Messrs. R. and G. CUTHBERTS' exhibit of their fine strain of Streptocarpus, together with the handsome Tritonia crocata aurea, was completely destroyed, and Messrs. WM. CUTBUSH AND SON's group of ivy-leaved Pelargoniums, dwarf polyantha Roses and Carnations was converted into a glorified rubbish heap by the swishing and swirling canvas when the big tent came down.

Messrs. BASTIN AND SON lost a large number of fine Begonia plants in the big tent, consequently their group, subsequently rearranged, was a comparatively small affair. Nevertheless it included well-grown examples all carrying superb flowers; Earl Derby, red; Pride of Bexley, salmon pink; Lady Grey, pink; King Edward VII., crimson scarlet; and Lady Cromer, pink, were very beautiful varieties.

Hardy Plants and Flowers.

Messrs. R. H. BATH, LTD., staged a large, high centred group of Delphiniums. Each of the numerous varieties was represented by about half a dozen spikes, and the whole group had a marginal belt of Canterbury Bells and Irises. Large numbers of the Delphiniums were new, unnamed seedlings, which showed that the firm is busily engaged in improving this useful garden genus. Messrs. PIPERS contributed Clematis, Buddleia variabilis magnifica, a collection of Sempervivums, the glowing Fuchsia triphylla, Carnations and Delphiniums.

Mr. MAURICE PRICHARD was a large exhibitor of hardy flowers, and among Paeonies and Delphiniums showed Primula Bulleyana, Clematis integrifolia, Dianthus hybridus carmineus, the vivid scarlet Verbena chamaedryfolia, and many other interesting plants. Messrs BAKERS grouped a delightful lot of Iceland Poppies, with Delphiniums, the attractive Centaurea dealbata, Phlomis Russelliana, Alchemilla major, and Hemerocallis Baronii, among other things.

Mr. J. C. ALLGROVE rescued his exhibit from the big tent, and staged it in another place. Some of his principal subjects were Coriaria terminalis, finely fruited, Magnolia Watsonii, a fine series of Heucheras, Rodgersia tabularis, Malva Olbia grandiflora, Thalictrum appendiculatum, Delphiniums, and Campanula persicifolia Humosa. Miss HANNEN and Miss COURTNEY, Mill House, Baldock, submitted a prettily arranged group of seedling single and double Delphiniums; the spikes were well developed and the colours good.

The large display of hardy flowers exhibited by Messrs. J. WATERER, SONS AND CRISP included capital groupings of Hypericum orientale, Genista dalmatica, Orchis maculata, Campanula garganica minor, Campanula turbinata pallida—very fine; Orchis foliosa, Delphiniums and Campanula persicifolia varieties.

Messrs. J. CHEAL AND SONS were represented by a series of Delphiniums, and a bright set of their Star Dahlias, and they had a fine lot of clipped trees in another part of the show. Messrs. H. CANNELL AND SONS massed Paeonies, Pyrethrums, Roses, Geums, and Erigerons in front of Delphiniums. An array of stately Delphinium spikes, all branched and finely grown, was set up by Messrs. KELWAY AND SON; Lloyd George, bright blue with white eye; Persimmon Improved, Jas. W. Kelway, and General Baden-Powell, were especially good varieties. Messrs. WHITELEGG AND CO. were exhibitors of Saxifragas, Campanulas and other small growing alpines.

Mr. SYDNEY MORRIS, Earlham Hall, Norwich, exhibited paintings of his superb new Montbretias, and the central figure was of the glorious variety His Majesty. Of this he offered one corm to the highest bidder at the end of the show. Messrs. TUCKER AND SONS filled a little rock garden with tiny shrubs, Saxifragas, Campanulas, Sedums, and Sempervivums. Mr. G. REUTHE made a special feature of brightly-flowered hardy Heaths, notably Erica cinerea atrosanguinea, E. c. pygmaea, and E. c. rosea; he also showed Athrotaxis Doniana and Nothofagus Menziesii, two of the rarer shrubs. Mr. Reuthe was one who suffered, and had to make the best of things after the wreck.

Mr. AMOS PERRY put up a very fine exhibit of hardy ferns; this was originally under the big tent, and its rearrangement in the early morning in the Orchid tent was a great effort. Crispum form of Scolopendrium vulgare filled the foreground and behind these were large numbers of handsome specimens of Lady and Male ferns in divided, tasselled and plumose varieties. In addition to his great display of ferns, Mr. Amos Perry showed a fine lot of Delphiniums, Ostrowskia magnifica and a charming set of new hybrid Liliums. Among the latter L. Roezlii × L. Amos Perry, orange, with blackish-brown spots; and L. Washingtoniana × L. maritimum, small, fine formed, brilliant orange with large spots, were two of the most attractive.

Mr. T. LEWIS, Hanwell, well known in the trade for many years, put up his first exhibit on his own account. He arranged a large exhibit of splendidly flowered specimens of Kalmia latifolia, grouped artistically with a few standards of Japanese Maples rising above the pink blooms—a charming group. Finely flowered plants of Kalmias were grouped with Japanese Maples in a large group by Messrs. J. WATERER, SONS AND CRISP, and the display was greatly admired.

Messrs. R. WALLACE AND CO. arranged a sunken garden with a central cruciform pool filled with Water Lilies. A hedge of Box surrounded the whole, and within this shelter were banks of blue and pink Hydrangeas, Astilbes and corner groups of golden Eremuri, associated with Delphiniums, Liliums, Malvas, Erigerons and other border flowers. The pool was edged with dull-red tiles and surrounded by turf. Two low sets of steps led down to the Water-Lily pool and a tiled path encircled the whole. Lead vases marked the head of the steps. This was one of the exhibits in the big tent, and was nearly finished when the collapse came, but with commendable promptitude Mr. Wallace and Mr. Dillistone set to work again and, though they could not do what they would, they did what they could, and with very good results.

Fruits and Vegetables.

The tent used previously for conference purposes was utilised on this occasion by Messrs. GEO. MONRO, LTD., who practically filled it with a magnificent exhibit of choice fruits and vegetables, which were not only splendid examples of market produce, shown in the original market packages, but was admirably staged, and, lastly, the firm presented the whole of it to be sold for the relief fund—a munificent gift. In the centre were green, half ripe and ripe Bananas, cases of Pineapples, and boxes of West Australian Apples. In front of these were baskets of black and white Grapes, sieves of Cherries, punnets of Strawberries, and boxes of Cape Doyenné du Comice Pears. On either side of these Tomatos and baskets of Cucumbers were associated with home-grown and Jersey Potatos, Guernsey and Worthing Beans, Vegetable Marrows, Carrots, Onions, Kentish Peas, Lettuces, and early Cabbages. Other fine subjects were Spanish Lemons, Valencia Oranges, home-grown Peaches and Nectarines, and Guernsey and Worthing Melons. It was altogether a grand display, and worthy of a great firm.

Messrs. LAXTON BROS. had an exasperatingly attractive group of splendid Strawberries, and showed their own varieties, Bedford Champion, Laxtonian (grand deep colour), Bountiful, International, and Laxton's Latest, but Laxtonian was the outstanding variety both for size and colour.

Exhibits in the Open.

Many of the outdoor exhibits were left over from the Chelsea meeting, so that the work was greatly simplified, though much had to be done to bring them up to the high standard which British nurserymen have set for themselves. Lawns were cut, garden paths weeded and surfaced with gravel, and the whole surroundings swept and garnished. All the rock gardens remained, and the firms responsible for them had a busy time removing plants which had passed out of flower and planting with others.

To the many visitors who had not attended a month ago these rock gardens presented a particularly fresh, yet established, appearance, and were the centre of much admiring interest, with not a little envy. Besides the rock gardens, the various groups of hardy trees and shrubs received their full meed of admiration. The wonderful collection of Japanese Maples from Messrs. W. FROMOW AND SONS, which included almost every possible variation of form and colouring, was even more gorgeous than before, while the standard and Emperor's Crown Bay trees arranged so tastefully by Mr. L. R. RUSSELL were every bit as luxuriant as last month, and his famous golden and silver Ivies added the neces-

sary colour. Mr. JAMES MACDONALD, the grass specialist, made a nice border of many species of grasses, so many that visitors were astonished at their numbers as well as their grace. In a tent Mr. MacDonald had a valuable stand of herbarium specimens.

Of the many rock gardens space does not permit full details—they were well described in our Chelsea Meeting number—but although the full glory of the spring alpine plants has passed, with the approach of the summer season (though not summer weather at the moment) they are equally fascinating, though in a more sober manner. Still there was plenty of colouring, and the building up of the boulders and terraces formed object-lessons in garden construction, as well as providing fitting homes for the various plants.

In their rock garden remaining from the spring exhibition on May 20-22, Messrs. W. WALLACE AND CO. added many Stonecrops, Primulas and Saxifragas, while Messrs. J. WOOD, who had made splendid use of their Yorkshire stone, planted charming plants of the beautiful Blue Butterfly Larkspur and many Campanulas, as well as a young Umbrella Pine (Sciadopitys verticillata) in just the proper position, at the margin of the pond, where it would receive the atmospheric moisture which is so essential to its well-being. Messrs. G. G. WHITELEGG AND CO. had cool, restful Funkias by their pool, and many Saxifragas, particularly Saxifraga calabrica, amongst the boulders. Campanulas, of many sorts, and Sedums were particularly attractive in the rock garden of Mr. C. ELLIOTT, while the Misses K. and E. HOPKINS brought many fresh plants. Besides a rock garden Messrs. R. TUCKER AND SONS had an outdoor stand of many fascinating little succulent plants, dwarf Maples and lead figures. Messrs. J. PIPER AND SONS put their garden in order, and made it very charming. The dainty Blue Butterfly Larkspur and Red Valerian found many admirers, who were also fascinated by the examples of topiary and standard Bay trees.

In his paved garden Mr. HERBERT JONES planted fresh Hartstongue Ferns and masses of Red Valerian, both of which were particularly effective. The large formal garden, as well as the rock garden of Messrs. PULHAM AND SON attracted a deal of admiration.

Garden Sundries.

The many material aids to successful gardening, such as manures, fungicides, insecticides and tools, were not so numerous as a month ago, but still there was an ample choice of these necessities.

Tomorite, Vegerite, and the old and tried Icthemic Guano were again shown by Messrs. PRENTICE BROS.

Messrs. WM. COOPER AND NEPHEWS staged Tomarite, their fungicide, which is also said to be an effective remedy for White Fly. Their Diffusor spraying syringe was also on view.

Knapsack and hand sprayers of excellent appearance were staged by the ABOL COMPANY, who also had their well-known insecticides and fungicides.

Garden furniture was particularly plentiful, and the exhibitors included Messrs. LIBERTY AND CO., Messrs. A. W. GAMAGE AND CO., the DRYAD CANE FURNITURE COMPANY, Messrs. HUGHES, BOLCKOW AND CO., Messrs. CASTLE AND CO., while gates and vases were shown by Mr. GEO. BLAY and Messrs. T. CROWTHER AND SONS. Rustic summer-houses and arches by the LEYTON TIMBER COMPANY were particularly good, while the ACME LADDER COMPANY demonstrated the handiness of their patent extension ladders. Garden pictures by Miss WINIFRED WALKER and Miss PILKINGTON attracted many admirers, while the Butterfly pictures by Mr. MONTAGU SUMMERS were both novel and effective. Real butterflies, exotic and indigenous, were placed on paintings of various plants and flowers.

AWARDS BY THE R.H.S. COUNCIL.

Wigan Cup for Roses to Mr. Elisha J. Hicks. *Gold Medals* to Messrs. Armstrong and Brown for Orchids, James Carter and Co. for Flowering Plants, Charlesworth and Co. for Orchids, Sir Jeremiah Colman, Bart (gr. J. Collier) for Orchids, Messrs. Mansell and Hatcher, Ltd., for Orchids, Amos Perry for Ferns, Stuart Low and Co. for Orchids, R. Wallace and Co. for Water Garden. *Silver-Gilt Flora Medals* to Messrs. J. C. Allgrove for Herbaceous and Flowering Plants, R. J. Bastin and Son for Begonias, B. R. Cant and Sons for Roses, John Peed and Son for Gloxinias. *Silver-Gilt Banksian Medals* to Messrs. J. Cheal and Sons for Clipped Trees, W. Fromow and Sons for Japanese Maples, T. Lewis for Kalmias, L. R. Russell for Stove Plants, Waterer, Sons and Crisp, Ltd., for Kalmias, etc., W. S. Watney, Ltd., for Geranium "Victory." *Silver Flora Medals* to Messrs. Bakers', Ltd., for Flowering Plants, R. and H. Bath, Ltd., for Delphiniums, Robert Bolton for Sweet Peas, Chaplin Bros. for Roses, Alex. Dickson and Sons for Roses, C. Englemann for Carnations, Rev. Joseph Pemberton for Roses, Messrs. Maurice Prichard for Flowering Plants, G. Reuthe for Ericas and Flowering Plants, Waterer, Sons and Crisp, Ltd., for Flowering Plants. *Silver Banksian Medals* to Messrs. G. and W. H. Burch for Roses, H. Cannell and Sons for Flowering Plants, T. P. Edwards for Roses, Kelway and Son for Delphiniums, James MacDonald for Grasses, R. L. Mond (gr. C. Hall) for Calceolarias, etc., J. Piper and Son for Flowering Plants, G. G. Whitelegg and Co. for Saxifragas, etc. *Bronze Flora Medal* to Miss Muriel Hannen for Delphiniums. *Silver-Gilt Knightian Medal* to Messrs. Laxton Bros. for Strawberries.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

ANNUAL FESTIVAL DINNER.

JUNE 19.—The seventy-sixth anniversary festival dinner of the Gardeners' Royal Benevolent Institution was held on the above date at the Grocers' Hall, Prince's Street, London, by kind permission of the Worshipful Company of Grocers. As this was the first dinner held on behalf of the Institution since the outbreak of war, a very special interest attached to it. The chair was taken by Sir Harry J. Veitch, who has for so many years been identified with this horticultural charity as its treasurer. He was supported on this occasion by Lord Lambourne, Earl Brassey, Sir Stewart and Lady Samuel, Col. Sir John, and Lady Smith Young, Mr. Egerton Hensley (Master of the Grocers' Company), Mr. Edward Sherwood, Mr. W. A. Bilney, Dr. Keeble Mr. Arthur Sutton, Mr. Leonard Sutton, Mr. Edward White, Mr. and Mrs. G. Monro, Jnr., Mr. and Mrs. Joseph Rochford, Mr. and Mrs. Alfred Watkins, Mr. and Mrs. H. Morgan Veitch, Mr. Owen, Thomas, Mr. James Hudson, Mr. G. Reynolds, Mr. P. R. Barr, Mr. and Mrs. G. H. Barr, Mr. and Mrs. J. W. Barr, Mr. George Paul, Mr. H. B. May, Mr. and Mrs. J. O'Brien, Mr. and Mrs. A. Bullock, Mr. H. G. Alexander, Mr. J. F. McLeod, Mr. J. McKerchar, Mr. A. W. Metcalfe, Mr. N. Barnes, Mr. D. Ingamells, Mr. John Heal, Mr. F. J. Chittenden, Mr. W. Nutting, Mr. W. Cox, Mr. A. Dawkins, Mr. B. Wynne, Mr. G. H. Cuthbert, and many other supporters of the Institution.

The hall in which the dinner was held is one of the finest of the many famous City halls and is well known for its wood carving, its fine paintings and magnificent plate. On this occasion the eight large tables were beautifully decorated by Mr. Arthur Bedford, of Gunnersbury House Gardens, with Orchids, Carnations, Irises, Roses, Gladioli and plants sent by Messrs. W. Paul and Son, Messrs. Paul and Son, Messrs. Sanders, Messrs. Charlesworth and Co., Messrs. Barr and Sons, Messrs. James Carter and Co., and Messrs. Lowe and Shawyer.

After dinner and the honouring of the usual loyal toasts, Sir Harry Veitch proposed "Continued Prosperity to the Gardeners' Royal Benevolent Institution." He expressed the feeling of thankfulness all felt that the war, now practically at an end, had done so little material damage to our own land, but had we suffered so severely as many of our Allies, such a gathering as the present one would have been impossible. The Committee regretted there had been no festival dinner for five years; consequently the funds of the Institution had suffered. At the first annual dinner held in 1840 a sum of £128 was subscribed and as a result one pensioner was elected. Since that time, the work of the Institution had progressed steadily and the help it had been able to afford disabled gardeners or their widows had steadily increased, until now there were 247 pensioners, and the amount distributed in pensions annually was about £5,000. Altogether, the Institution had disbursed £165,000 in pensions, and in recent years had been able to assist those awaiting election by grants from the Victorian Era and the Good Samaritan Funds. It was not possible to place the whole of the selected candidates on the funds at any election; therefore, the need for increased subscriptions and larger liberality was as great as ever. The Institution had always been under Royal Patronage, and H.R.H. the Prince of Wales was now President, in succession to King George and the late King Edward. It was with great pleasure he was able to state that, all being well, His Royal Highness the Duke of Connaught would preside at the festival dinner next year. Sir Harry referred to the deep gratitude of the pensioners, and pointed out that one man who had subscribed 15 guineas eventually received £475 from the Fund. He was succeeded by his widow, and together they received a sum of £603 from the Institution. The pensioners lived long, and last year one died at the age of 101. The Institution had an insured income of £1,000 a year; management expenses were kept as low as possible, and at present Mr. G. J. Ingram, their able Secretary, was carrying on without any assistance. Sir Harry concluded his speech with a strong appeal for liberal support to an Institution with which he had been associated for about thirty-five years and of whose good work he could not speak too highly.

Sir Stewart M. Samuel proposed "The Ladies and Visitors, and this toast was responded to by Earl Brassey. Sir Harry Veitch received a great ovation when he rose to respond to the toast of "Our Chairman," ably and humourously proposed by Lord Lambourne. Speaking under great emotion, Sir Harry thanked those present for the kind reception they had given him, acknowledged the indebtedness of the Institution to the Worshipful Company of Grocers for the loan of the hall and thanked all those who had contributed so handsomely towards the splendid result obtained that evening—£3,700.

A delightful musical programme was provided, and a historic and notable meeting concluded with thanks to Mr. Bedford, to those who had sent flowers and plants, and the toast of the health of the Secretary, Mr. George J. Ingram.

The following were the principal donations:—Sir Harry and Lady Veitch, £262 10s.; Mr. Reginald Cory, £500; Messrs. William and Edward Sherwood, £250; Messrs. Sutton and Sons (Reading), £200; Mr. George Monro, £100; Messrs. Rothschild, £105; Mr. Ingamells (Covent Garden), £105; Mr. James Sweet (V.M.H.), £52 10s.; Mr. George Gollin, £52 10s.; Messrs. W. Wood and Son, £52 10s.; Mr. J. O'Brien, £43; Mr. Thomas H. Cook, £45; Mr. William Robinson, £50; Messrs. Fisher, Son and Sibray, Ltd., £36 5s.; Mr. Arthur Turner, £30; The Lady Northcote, £25; Lt.-Col. Sir George Holford, £26 5s.; Worcester Auxiliary (per Mr. Percy White), £35; Mr. Edward White, £21; Mrs. Edward White, £5 5s.; Mr. G. Randell Higgins, J.P., £21; Mr. Joseph Rochford, £21; Mr. N. F. Barnes, £20; Mr. H. G. Alexander, £19 19s.; Mr. James Hudson (V.M.H.), £25; Mr. John Heal (V.M.H.), £18 18s.; Mr. H. H. Thomas (Editor of *The Gardener*), £17 10s.; Mr. Arthur Dye, £12 12s.; Mr. John McKerchar, £12 12s.; Mr. A. Watkins, £21; Mrs. A. Watkins, £10 10s. The following contributed £10 10s. each:—Mr. E. M. Rodocanachi, Lady Samuel, Mr. W. H. Lees, Mrs. W. H. Lees, Mrs. Whitpaine Nutting, Mrs. E. Manwaring, Col. Sir John Young, Mr. Geo. Sutton, Messrs. Barr and Sons, Mr. G. A. Bishop (from America), Mr. A. Dimmock, Mr. T. Finch, Sir Jeremiah Colman, Messrs. Prothero and Morris, Mr. Herbert Hicks, Mr. R. F. Felton, Mr. Geo. H. Cuthbert, Messrs. H. B. May, Mr. Geo. Messer, Mr. M. Larsen and Mr. J. Collingridge.

TRADE NOTES.

THE Board of Agriculture draws attention to the fact that owing to the shortage of road transport in London it is important that fruit growers should co-operate to make up full cartloads of produce to individual consignees in the various markets, and thus economise the available facilities. For the same reason fruit intended for preserving should be consigned direct to the jam factories, so as to avoid unnecessary cartage to and from the markets. Railways can only accept for conveyance such quantity of produce as can be delivered promptly to the markets, and in order to avoid restriction of traffic it is essential that the fullest use should be made of carting facilities.

MARKETS.

COVENT GARDEN, June 25

Plants in Pots, &c.: Average Wholesale Prices.

		Stock, Dbl. White	12 0–15 0
		—Dbl. Pink ...	10 0–12 0
		—Dbl. Mauve ...	12 0–15 0
		—Dbl. Purple ...	12 0–15 0
		Violas, per doz. bun.	3 0– 4 0

Remarks.—With Pyrethrums finished and white Pinks practically over, white Stock is again more in demand. Pyrethrums with small, white, button-like blooms do not appeal to the majority of buyers, and can only be termed a cheap "line." Gaillardias and Coreopsis are increasing in quantities; there is also an abundant supply of Delphiniums, Cornflowers, White Daisies, Gypsophila, Iceland Poppies and Sweet Peas. Carnations and Roses are plentiful at the price quoted last week. Flowers on sale now include white and mauve Sultan and white and mauve Statice, both of which are arriving in excellent condition. Lilium longiflorum is still offered in good condition, and prices for this flower are a trifle easier. Lily of the Valley is not obtainable, but Stephanotis and Lapageria are more plentiful.

Fruit: Average Wholesale Prices.

Lettuce Cabbage and Cos, per doz.	1 6– 3 0		
Mint, per doz. bun.	9 0–18 0		
Mushrooms per lb.	2 0– 3 0		

Remarks.—The supplies of English Grapes, both black and Muscat varieties, are increasing daily. Strawberries are more plentiful, and Peaches, Nectarines and Melons are arriving in fair numbers. There is a shortage of Green Gooseberries, and hothouse Figs are scarce, but English Cherries are arriving in larger numbers. Black Currants, Apricots, Cherries, Peaches, Plums, Canteloupe Melons and Black Grapes are being sent by Continental growers. The Asparagus season is finishing, but the supplies of Tomatos are increasing daily; Peas and Broad Beans are plentiful. Cauliflowers are scarce, but there are fair quantities of Cabbages.

CROPS AND STOCK ON THE HOME FARM.

Haymaking.

Haymaking is in full operation. The crops are light, owing to the dry weather, but some few plots of Clover and Italian Rye Grass are good. Sainfoin, which is largely grown in Hampshire, is yielding a light return, therefore Hay is sure to be dear during the coming winter, as there is little old Hay in the country. If the cutting of Hay crops is long delayed, the quality of the Hay is depreciated by age. Italian Rye Grass becomes very hard and wiry. Field Grass, Sainfoin, Clovers, and the various temporary grasses do not require more than once turning after cutting; the more they are handled the more likelihood is there of destroying the leafage, which is all important in Clover and Sainfoin. Once turning, then putting the Hay into small "cocks" by hand, is sufficient before carting, assuming of course the weather is favourable. Swathe turners are admirable labour-savers, as a stout nag horse will turn twenty acres in a day much better than hand labour.

Hay made from these Clovers and Grasses provides the best food for army horses. Meadow hay is more appreciated for dairy cows and nag horses. The Grass should not be too old when cut, neither should it be allowed to become too dry before carting, as in this condition it loses colour and aroma. Sufficient heat should generate through the whole to secure that aroma which is so pleasing when the Hay is cut from the rick. Certain farmers favour the building of small ricks. I prefer one of not less than 20 tons; labour in thatching is saved, and there is less waste. A sharp-pitched roof is preferable to a flatter one, as in the former there is less "fusty" hay next to the thatch. Directly a new rick has settled down, the sides should be tucked and shaped, and the roof made up with the tuckings, which should be raked down quite smoothly to ward off rains until the whole has settled down sufficiently for thatching, which should not be neglected a single day after the rick is ready.

How strange it is there are so few Dutch barns in this country! These are very useful, and save labour. Into these barns the Hay can be carted a little at a time, thus saving the constant covering of the rick and final thatching. Time should be allowed for the gases of fermentation to pass away before the ricks are thatched; if thatched too early the quality of the Hay depreciates, and there is also a risk of damage from spontaneous combustion. *E. Molyneux.*

ANSWERS TO CORRESPONDENTS.

Address Wanted: Will Corporal S. W. Dance late of the H.Q., 40th Brigade, R.F.A., kindly send his address to the office of this paper, 41, Wellington Street, W.C.2?

British Gardeners' Association: *E. H.* Write to the Secretary, Mr. Cyril Harding, 22, Buckingham Gate, Strand, London, W.C.2.

Celery Unhealthy: *E. H.* In the absence of specimens it is impossible for us to know whether your Celery plants are affected with the leaf-mining grub or the disease caused by the fungus Septoria petroselini variety Apii. It is too late to attempt remedial measures for the mining grub; surface washes are useless, the only method being to pinch the insect between the finger and thumb. Next season dust the plants with some distasteful substance, such as Quassia extract, to prevent the mother fly laying her eggs in the tissue of the leaf. Celery blight has spread to most parts of the country and is generally first noticed about July. If the plants are sprayed with Bordeaux mixture as seedlings and again in July and August the fungus will be kept in check and a satisfactory crop obtained.

Curled Rose Leaves: *J. S.* The curling of the Rose leaves is due to the larvae of the Leaf-Rolling Sawfly. The removal of all rolled leaves by hand will be found the most effectual remedy, as it is difficult to get any spraying fluid in contact with the caterpillar, which remains under the curled surfaces of the leaves. After removing the affected leaves, spray the bushes with a nicotine wash.

Market Gardeners' Compensation Act: *Southern.* You can obtain a copy of this Act from H.M. Stationery Office, Imperial House, Kingsway, W.C.2; or 23, Forth Street, Edinburgh.

Name of Plants: *H. G.* 1, Kalmia latifolia; 2, Calycanthus floridus. *Miss B.* The yellow flower is Phlomis fruticosus; the white-flowered shrub Staphylea colchica. *S. W.* 1, Calycanthus floridus; 2, Arum Dracunculus.

New Fruit and Kitchen Garden: *A. G. S.* It will be advisable to obtain the advice of a practical gardener in your district as to the subjects best suited for your various plots, as advice given without knowledge of the soil and situation may be misleading. Do not plant Apple and Plum trees in the same rows as previously occupied by these fruits, because, after a few years, the standard Plum trees are likely to become uneven and spoil the appearance of the rows. The planting of large fruit trees, as in your old garden, is not recommended, as they would overshadow other crops. It is much better practice to plant the various kinds of bush fruit on plots by themselves, as they will then be more convenient for netting, and produce much heavier crops. Very fine fruits of Apples and Pears are obtained from espalier-trained trees, and this style of training has much to recommend it, especially in a small garden. If you desire to plant Apple trees round your garden plots they should be on the Paradise stock and 15 feet apart; no other fruits should surround the plots. Another plot, 45 yds. × 45 yds., should be sufficient for a vegetable garden, provided the bush trees are planted by themselves. Paths 15 to 20 yds. apart will suffice for a small garden. The trees suggested for a protecting hedge will be very suitable. The Fir plantation as a protection from wind should not be too close to the garden plots as these trees will produce shade which may, at some future time, be detrimental. Two houses, 20 ft. × 10 ft. should produce sufficient Tomatos, Cucumbers, and Melons for your requirements. A pit in front of the potting shed would be very suitable for the growth of Melons. Meanwhile, trench and manure the ground in order that planting may be done in November.

WANTED, a HORTICULTURAL INSTRUCTOR (Man or Woman), well qualified in Scientific Horticulture, particularly Fruit Growing. The person appointed will be required to conduct classes in connection with school gardens, and lectures to teachers and others. Commencing salary £150 per annum, rising by increments of £10 to £200, plus an allowance of £10 per annum for use of cycle. Rail fare allowed. Applications to be made on Form 10 (copy of which may be obtained from the undersigned), giving full particulars of training and qualifications, not later than 15th July.

W. E. WATKINS, Secretary
Education Office, County Hall, Ipswich,
18th June. 1919

SUPERINTENDENT wanted for private estate in Canada; must be qualified to take complete charge of gardens, grounds, farm, livestock, poultry, etc.; only first-class men with experience need apply.—S. N., Box 21, 41, Wellington Street, Covent Garden, W.C.2.

WANTED, a HEAD GARDENER for Ashwell Rutland; man and boy kept; 40s a week and house; must thoroughly understand Fruits, Vines, Flowers and Vegetables.—Apply by letter to COLONEL BLAIR, 112, Eaton Square, S.W.1, giving full particulars.

HEAD WORKING GARDENER wanted now for Derbyshire; experienced with indoor Carnations and Vegetables; two under kept; cottage.—Write, stating experience, references and wages, to Mrs. HENRY RAMSDEN, 10, Stanhope Street, Sussex Square, London, W.2.

WANTED, GARDENER (HEAD WORKING), two under, for busy country hotel; must have good knowledge early vegetables and salads and growing choice vegetables for big consumption; small amount lawn and ornamental flowers; greenhouses; few pigs.—King's Head Hotel, Harrow, Middlesex.

WANTED, Single-handed GARDENER. Thoroughly experienced Herbaceous Plants, Vegetables; about one acre under cultivation; practically no glass; on account of difficulty lodging accommodation, single man desirable. Wages 45s; no cottage.—Apply to R. M. WOOD, Flint Cottage, Box Hill, Dorking.

WANTED, GARDENER (SINGLE-HANDED); experienced; wages 35s. and cottage.—Apply, E. BARTRUM, Stockton, Codford, S.O., Wilts.

SINGLE-HANDED GARDENER wanted at once, help given; cottage, electric light and vegetables.—PATTINSON, Churt House, near Farnham, Surrey

GARDENER wanted on Training Colony; abstainer; well up in vegetables and able to teach gardening.—Apply SUPERINTENDENT, Turner's Court, near Wallingford, Berks

WANTED, a strong man to take place as SECOND GARDENER; must be good for In and Outside work; also strong LAD for Pleasure Grounds—Apply to ROBERT GRIFFIN, Court Garden, Marlow, Bucks.

WANTED, SECOND GARDENER; use of small lodge and 35s. weekly; also strong LAD, 18 to 20, wages £1.—Apply to ROBERT GRIFFIN, Court Garden, Marlow, Bucks.

WANTED, GENERAL FOREMAN, also JOURNEYMEN, Inside and Out; bothy, vegetables and attendance; duty alternate weeks; 1 o'clock Saturdays. Reply, stating wages, experience, etc.—WREN, The Gardens, Ashby St. Ledgers, Rugby.

WANTED, six smart, active JOURNEYMEN immediately, chiefly for Pleasure Grounds; lodgings now, bothy later; state experience, age, wages expected.—Copies of testimonials, etc., to GEO. MORBEY, The Gardens, Lilleshall House, Newport, Salop.

WANTED, a thoroughly experienced JOURNEYMAN for Fruit and Plant Houses; wages 38s. per week, bothy, etc.—Apply, stating age, particulars of experience, with copies of testimonials, to the HEAD GARDENER, Stoodleigh Court, Stoodleigh, Tiverton, Devon.

WANTED, JOURNEYMAN for Kitchen Garden and Pleasure Grounds.—State wages required with bothy, to F. FAIRCHILD, Manor Gardens, Healing, Grimsby.

WANTED, three good JOURNEYMEN for Pleasure Grounds, Kitchen Garden, and general outside work, accustomed to use scythe; wages 34s. per week, bothy, etc.—Apply, stating age, with copies of testimonials, to the HEAD GARDENER, Stoodleigh Court, Stoodleigh, Tiverton, N. Devon.

WANTED, two JOURNEYMEN for Inside; wages 35s. per week; good bothy; hours 7 to 5, 1 p.m. on Saturdays.—Apply, with references, to T. SPARROW, Locko Park Gardens, Derby.

WANTED, two JOURNEYMEN for Pleasure Grounds, Kitchen Garden and general Outside Work; 32s., with bothy.—HOLMES, Kenton Grange, Harrow-on-the-Hill.

WANTED, JOURNEYMAN (Inside), experienced; bothy and good wages.—H. WENMAN, The Gardens, Temple Newsam, Leeds.

WANTED, JOURNEYMAN for Kitchen Garden and Pleasure Grounds; duty every third week; wages 30s., bothy, milk, vegetables, 1 o'clock Saturdays.—R. RYE, Woodlands, Uxbridge.

WANTED, JOURNEYMEN, chiefly Outside; wages 30s. per week, rooms, etc.; Sunday duty and overtime paid.—Apply, stating age and experience, to G. TAYLOR, Bulstrode Gardens, Gerrard's Cross, Bucks.

WANTED, smart JOURNEYMAN for Inside; experienced in Carnations and Plants generally.—State age, experience, and wages required, bothy, particulars to, EDWIN BECKETT, Aldenham House Gardens, Elstree.

WANTED, JOURNEYMAN for Inside and Out; goods wages.—Apply, J. V. MACDONALD, The Gardens, Whetstone, Edgbaston, Birmingham.

WANTED, two MEN (experienced), one Kitchen Garden, one Pleasure grounds.—State wages required, with particu'ars, to T. HAZELDINE, Crosswood Gardens, Cardiganshire.

WANTED, two MEN, one take lead Herbaceous Borders, Roses, Flowering Shrubs, Topiary work; one Alpine, Wall and Water Garden; one wanted with knowledge of Bees. Wages 35s., good bothy, and attendance; overtime extra.—Apply, E. JONES, The Gardens, Shalesbrooke, Forest Row, Sussex.

WANTED, a thoroughly experienced MAN for the houses; well up in his work; wages 35s. per week, with bothy; 1 o'clock Saturdays.—State age and particulars to W. KENT, The Gardens, Bookham Grove, Bookham, Surrey.

WANTED, experienced, practical MAN (single) for Rock Garden work chiefly; rooms, etc., provided.—State wages required and full particulars to HEAD GARDENER, Woodcote Grove House Gardens, Coulsdon, Surrey.

WANTED, single MAN for Pleasure Grounds and Kitchen Garden; duty every third week; one o'clock Saturdays; bothy, milk, vegetables and attendance; wages 31s. 6d. State age and particulars.—G. E. WEEKES, Penoyre Gardens, Brecon.

WANTED, good MAN for Fruit, Plant and Orchid Houses; no bothy.—Wages and particulars of experience to GARDENER, Feltham Lodge, Feltham, Middlesex.

TWO MEN wanted for outside work; no bothy—State wages to R. HOUGHTON, Manresa House, Roehampton, S.W.15.

WANTED, MAN, experienced, for Herbaceous and Flower Garden, and Pleasure Grounds, immediately; good wages, with bothy, milk, vegetables, etc., provided; duty and overtime paid.—Please state age, experience, and particulars to, GEO. BROWN, Brownsea Castle Gardens, Poole, Dorset.

WANTED, MAN experienced in Greenhouse Plants; 27s. a week, including laundry; live in, bothy, coal, light and vegetables found.—Apply to HEAD GARDENER, Marshal's Wick, St. Albans.

MARRIED COUPLE, to live in, wife as Cook, man to work in garden, where others are kept; both must be able to give first-class references from previous situations.—C. LOUCH, Esq., Colbury House, Totton, Southampton.

WANTED, YOUNG MAN with experience in Vines, Peaches, and Plants; good bothy, milk, and vegetables; one o'clock Saturdays; duty every third Sunday.—State age, and wages, HEAD GARDENER, Clifton Hall Gardens, Nottingham.

YOUNG MAN required, to assist in Orchids; good knowledge essential; wage 35s., bothy and attendance.—Apply, stating age, experience, with copies of references, CHEADLE, Wallhouse Gardens, Torphichen, Linlithgowshire.

WANTED, YOUNG MAN for Kitchen Garden; able to take duty; wages 32s. 6d. per week, with bothy, etc.—Apply with particulars of experience, age, etc., to G. F. HALLETT, Netherby Gardens, Carlisle.

WANTED, YOUNG MAN for Motor Mowing Machine and border work; married or single. State age and wages required.—Apply F. J. STONE, The Gardens, Shabden Park, Chipstead, Surrey.

WANTED, YOUNG MAN, chiefly for Outside; strong and willing; state wages and references; bothy, milk and vegetables.—J. BENSTEAD, The Gardens, St. Nicholas, Richmond, Yorkshire.

WANTED, experienced YOUNG MAN for Inside work.—Apply Alfreton Park, Derbyshire.

LADY GARDENER wanted immediately, to work under expert in large Rock and Water Garden; must be strong and experienced in propagating; good references; salary 30s. inclusive.—ANDERSON, Glenn Hall, Leicester.

WANTED, two strong Garden LABOURERS or IMPROVERS, wages 30s. to 35s. per week.—Apply, stating age and full particulars, to F. SILLITER, Aberpergwm Gardens, Glynneath.

TRADE.

UNIVERSITY OF LONDON.

NOTICE IS HEREBY GIVEN that the Senate will proceed to elect an External Examiner for the Final Examination in Horticulture for the Degree of B.Sc.(Hort.).

N.B.—Attention is drawn to the provision of Statute 124, whereby the Senate is required, if practicable, to appoint at least one Examiner who is not a Teacher of the University.

Particulars of the remuneration and duties can be obtained on application.

Candidates must send in their names to the External Registrar, Geo. F. Goodchild, M.A., B.Sc., with any attestation of their qualifications they may think desirable, on or before Saturday, 5th July, 1919.

It is particularly desired by the Senate that no application of any kind be made to its individual members.

If testimonials are submitted, three copies at least of each should be sent. Original testimonials should not be forwarded in any case. No special form of application is necessary.

University of London,
South Kensington, S.W.7.
June, 1919.

HERTFORDSHIRE COUNTY COUNCIL.

HORTICULTURAL INSTRUCTOR.

THE Hertfordshire County Council invite applications for the post of Peripatetic Lecturer and Staff Instructor in Horticulture and Botany.

The Instructor appointed will be required to teach and supervise Gardening at Elementary Schools and to give Lectures on the above-named subjects.

The salary will be £115 per annum with additions for previous experience, rising to £260 per annum. The Instructor will be required to devote his whole time to his duties and to provide and maintain a bicycle, in respect of which he will receive a mileage allowance.

Applications must be made on forms which can be obtained from the Education Department, Hertford, and must be forwarded to the undersigned not later than the 5th July, 1919, accompanied by copies of not more than three recent testimonials.

CHARLES E. LONGMORE,
Clerk to the Hertfordshire County Council.
Education Department, Hertford, Herts,
June, 1919.

HARDY ORNAMENTAL NURSERY, near Toronto, Canada, doing extensive Landscape business, wants a man thoroughly experienced in Garden design and construction; must be educated, energetic and capable of taking charge.—State experience and references. N.S., Box 21, 41, Wellington Street, Covent Garden, W.C.2.

FERN PROPAGATOR wanted for this Nursery; unmarried; good opportunity for first-class Man. State wage, experience, and where gained, also wage expected.—FINDLAY BROTHERS, Springhill Nursery, Baillieston, Glasgow.

WANTED, for Branch Nursery, GROWER young, experienced in Fruits, Herbaceous Plants, etc.; able to take control if necessary; wages required and references to HOPWOOD & SON, Nurserymen, Cheltenham.

This is the **ENTERPRISE** *clip bracket*

introduced for the Purpose of training or supporting Vines, Creepers, Tomato Plants, Plants and Cuttings of all Varieties

IT DOES AWAY WITH THE
old way of tying with string: often detrimental to the plant. All it is necessary to do is, place the clip on stick at the desired spot and place plant in clip. As the plant grows the clip can be moved on stick. Made in various sizes for different sized sticks.

Nurserymen, Gardeners & Amateurs
will find this clip bracket most useful and labour-saving—in fact, it combines work with Pleasure, Ease and Comfort.

Per 12/- Gross

Carriage paid on all orders of £2 to any part of the United Kingdom. Smaller lots at 1/- per dozen and postage 3d. per dozen extra.

THE GARDENERS' CHRONICLE

ESTABLISHED 1841. No. 4097.

No. 1697. VOL. LXVI. {THIRD SERIES} SATURDAY, JULY 5, 1919. Registered as a Newspaper. PRICE 4d. POST FREE 4½d.

SUBSCRIPTIONS—Inland, 19/6; Foreign, 22/- per annum. Entered at New York Post Office as second-class matter.

Postal Address—41, Wellington Street, Covent Garden, W.C.2. Telegraphic Address—"Gardchron, Rand, London." Telephone—Gerrard 1543.

☞ For CONTENTS see page 1.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

RIVERS' FRUIT TREES, Roses, Vines, Figs, Oranges and Orchard House trees are of first-class quality, and a large and select stock is always on view. Inspection invited. Price list post free on application.—THOS. RIVERS & SONS, The Nurseries, Sawbridgeworth, Herts.

A Well-Designed CARNATION HOUSE.

Carnations, to be successfully grown, require a House and special treatment to themselves. The House illustrated is a comparatively cheap type, and yet it is splendidly designed to meet every requirement. It has a complete system of Ventilation at roof and side. Whilst specially designed for Carnation growing it has the advantage of being suitable for use as a general Plant House.

It is sturdily built ; selected materials of the best quality and highly skilled workmanship give the Strength and Finish which characterise all B. & P. Structures. This house will give you the best results, and that lasting satisfaction which only well-designed and soundly-constructed buildings can fully afford.

Write for Illustrated List of Small Glasshouses.

No. 4 Carnation House.

No. 4 Carnation House is made of selected well-seasoned red wood of superior quality, and strengthened with our improved cast and wrought iron fittings. Substantially framed ; strengthened with spandril brackets. Complete system of ventilation at roof and side. Iron gutters fitted and down pipes provided. Full Specification and Estimate on application.

A VISIT TO AN INDIAN GARDEN.

WHILST recruiting my health after a period of active service overseas, it has been my privilege to meet an old friend and Kewite in the person of Mr. E. Little, who is in charge of one of the finest gardens on the west coast of India.

I had visions in days gone by, when visiting horticultural exhibitions throughout the country, of what a tropical garden must be like, and here, in this Indian garden, the lofty Palm trees and other tropical vegetation, with the delicious fragrance of the strongly scented flowers, left an imprint on the memory never to be effaced.

Government House, Ganeshkhind, the "rainy-season" residence of the Governor of Bombay, is a fine building about 120 miles from Bombay, close to Poona, on the Western Ghats. At the time of my visit, September, 1918, the lack of the monsoon rain was at once noticeable in the park, for the grass was getting brown, and there was great anxiety with regard to future rains.

Each side of the various avenues, Banyan and Nandruk trees (Ficus benghalensis and F. retusa) were planted, affording a cool shade from the rays of the burning sun. On either side, I noticed rocks protruding from the ground, and was informed that the soil is rock shale, a few inches over the solid rock, and that it is necessary to blast holes for tree-planting operations.

Notwithstanding this drawback Acacia arabica was doing well, also the Tamarind, the Neem, and the tallest trees, Millingtonia hortensis. The planted specimens noticed, included the sweet-scented Acacia (A. eburnea) and the sandal wood (Santalum album).

There are three distinct gardens at Ganeshkhind, the combined kitchen and fruit garden, the upper and the lower garden. On entering the kitchen garden, the first thing noticed was a long border of Bananas, planted in double rows six feet apart each way, and in various stages of fruiting. It was interesting to note that suckers six feet high were often planted, the leaves being cut back in the same way that Tree Ferns are cut for planting, and these suckers fruit in from six to eight months. A plantation of Bananas in this district lasts from three to four years, and sometimes longer. Next to the Bananas was an Orange grove, in which were young Orange trees the picture of health, four to five years of age, and 16 to 18 feet high, fruiting for the second time, the first crop having been picked the previous monsoon season. These trees were planted 12 feet apart, and were budded on the Lime. It was noticeable that the fruits, although green, were quite ripe. The Custard Apple was next noticed, in perfect health. The ground is laid out by division into squares for irrigating purposes, the water running along channels into the squares requiring water, but at the time of my visit the ground was not planted, owing to the lack of rain.

The principal vegetable crops grown for the cool season, October-February, are Cabbages, Cauliflowers, Carrots, Beets, Peas, Leeks, Celery, and Salads. Very few European vegetables are available in this district during March, April, and May. From the end of May and onwards Peas, Beans, Beets and Carrots, and, if rains are not too heavy, Cabbages and some members of the Vegetable Marrow family are grown. Recently, strange to say, it was very difficult to get a good crop of Peas from high-class English varieties, but acclimatised Peas grown in the neighbourhood bore remarkable crops equal in quantity (no acclimatised Peas equal the better English varieties in quality) to any seen in England, whilst side by side a row of Peas of a well-known variety, and from a first-class English firm, costing Rs.60, equal to £4 sterling, was a complete failure.

A patch of Potatos had just been dug, and a very good crop was noticed. These were planted in July, so that they were about twelve weeks planted. The prevalent disease, I was informed, was Ring-disease, which causes a black ring close to the skin. Tomatos looked well planted out, and the plants fruit in eight weeks from planting out time.

Many vegetables have to be grown on ridges during the rainy season to raise them above the water on the land, as it rains every day during the monsoon season, sometimes three weeks at a time, and the whole land becomes water-logged.

One very noticeable fruit tree was the Pomelloe, bearing an enormous, Orange-like fruit as large as a man's head, with a reddish flesh, thick pith inside the skin, and flesh of bitter-sweet flavour. I also noticed the so-called Grape-fruit trees (a supposed cross between the Orange and Pomelloe). The Papaya, growing on a single stem 20 feet high was next noticed, the plant fruiting in ten to twelve months from the time of sowing the seed. This fruit grows as large as a medium-sized Vegetable Marrow, and is of sweet flavour. Although it is green when ripe, it sometimes assumes a yellow tinge.

The sweet Lime, or Tight-skinned Orange, is largely grown, and the trees bore fruits in all stages of development. It was noticeable that these trees were fruiting right down the stems on the young growths. These are forced into fruit by root-pruning; the Oranges are allowed to get dry at the root and are then root-pruned. Walking between two rows of Limes I was greeted with a delicious fragrance; the plants are very ornamental. Mr. Little informed me that the lowest temperature (January and February) is about 50°, whilst the highest temperature (middle of April to May) is about 110° in the shade.

Of the uncommon vegetables grown, Brinjals, or Egg-fruits, are similar in size and shape to the fruits of Passiflora edulis, whilst Ladies' Fingers (Hibiscus esculentus) are used for cooking purposes, and are very common vegetables in this part of India.

The whole of the vegetable garden is used for experimental and demonstration purposes. Some English vegetables, such as Parsnips, give very poor returns, Broad-beans rarely fruit, whilst Scarlet-runners never set their pods.

The Mango grove comprises very fine trees. The two best varieties for flavour, Alphonso and Pairia, were planted extensively, the trees being 40 feet high and the same through. Grafted trees never attain the same size as seedlings, but the latter cannot be depended upon to produce well-flavoured fruits. A tree planted three years ago was about 12 feet high by 8 feet through, which gives one an idea of the rapid growth of vegetation in tropical countries.

Passing on from the vegetable and fruit garden, I came to what is called the lower garden, covering an area of about ten acres, consisting of collections of tropical specimens planted in big borders and shrubberies surrounded by a hedge of Dodonaea viscosa and Duranta Plumieri.

The first thing I noticed was a collection of Crotons growing in tubs, six to eight feet high and the same through, superb specimens of horticultural skill. Hibiscus furcatus (a climbing species) in full bloom was a very fine specimen; the lovely primrose-coloured flowers, with a chocolate eye, gave a fine colour effect. Next to this was a true, tropical climber, with very pretty fruit, grown for decorative purposes.

Along the walk, as an edging, in pots, was Anthurium crystallinum, and also in tubs in the back row was Anthurium Scherzerianum. Pothos aureus was climbing over a Gul Mor, and on another trunk was the Vanilla. A group of Dracaenas in variety, edged with Eucharis, which flower abundantly, was noted under Palm trees. Begonia President Carnot was growing in pots along another walk. The Panama Hat Palm, Clerodendron, Cycas revoluta, Panax Victoria and many species or varieties of Panax and Aralias were seen in profusion.

The Indian Elm, Holoptelia integrifolia, was noticed, also a fine specimen, 50 feet high, of the Fiddle-wood tree, Citharexylum subserratum. A group of Casuarina equisetifolia, 80 to 100 feet high, shades the tennis courts, of which there were three. Bignonia gracilis was climbing the stem of a tree of Ficus glomerata.

A border of Hymenocallis littoralis, 200 yards long and three to four yards through, was magnificent, whilst the perfume was delicious, the whole giving a truly tropical scene, with Palms waving overhead.

Pandanus furcatus, 16 feet high, showed the true nature of the Screw-pine. There was also a fine specimen of Cassia siamea. Bougainvillea glabra, climbing 70 to 80 feet high, was in full bloom.

Sanchezia nobilis, an ornamental foliage plant with golden veins on the leaves, was very pretty. A long border of Alpinia nutans in full flower, eight feet through and the same in height, was superb. This border had a background of Oleanders in variety. There I noticed Tricholaena Wightii, a very pretty ornamental grass deserving of more extended cultivation, and very effective for florists' purposes.

In open spaces in this garden such flowers as Coreopsis and Asters are grown on a large scale. The white Bauhinia was just coming into flower; other varieties are grown, but they were not in bloom at the time of my visit. A Lily pond contained a blue variety of Nymphaea Lotus, the blue petals, set off by a yellow centre, producing a fine colour effect. The flowers measured, on an average, 10 to 12 inches across, and they had a lovely Hyacinth-like perfume. The leaves of this particular variety, which Mr. Little informed me originated locally, were quite 18 inches across, and almost circular in outline.

There were plenty of Coconut palms (Cocos nucifera) coming into bearing. Close by I also saw the Travellers' Tree (Ravenala madagascariensis). Bamboos in variety were especially fine, specimens 60 feet high and 30 feet through being common. The Silk Cotton Tree (Bombax malabaricum) thrives here.

A huge clump of Russelia juncea was in full bloom, and with its coral-red, tubular flowers and an edging of Hymenocallis gave a very pleasing effect. The Japanese Rice Paper plant (Fatsia papyrifera) was growing here also. A species of Justicia is extensively used as an edging everywhere, and was very effective to a long border of Agaves. Acalypha Sanderiana was in full flower, a border of it, 50 yards long, the plants six feet high, making a fine show.

From this garden to the flower garden proper, a pergola about 200 yards long, furnished with Thunbergia laurifolia, Allamanda grandiflora, and other suitable climbers formed the connection. In the background on either side, grew Acalyphas, Poinsettias, Bauhinia variegata, and other plants.

In the nursery I saw Violets in pots, Begonias in variety, Poinsettias, Geraniums, Eucharis amazonica, and Michaelmas Daisies, all intended for planting out later, also dozens of Palms in variety in tubs for indoor decoration. The scent of the Cork trees was delicious. I next inspected the flower garden proper. This garden is divided by Government House in the centre, into what I will term the eastern and western gardens. The eastern garden consists of flower beds 40 yards long by 30 yards wide, laid out formally and filled with a variety of plants edged with Justicias and Pilea (the Artillery plant). This garden is about 200 yards long and 80 yards wide. It is bordered on the one side by Cork trees 100 feet high, and, as I have already mentioned, they filled the neighbourhood with their delicious fragrance.

The finest foliage effect was provided by an irregularly-shaped bed containing four Palms (Livistona chinensis), Acalypha tricolor underneath, edged with Eranthemum albo-lineatum, with a ground-work of Tradescantia. Others were planted with a reddish, golden-bordered leaved Coleus. There were also Cannas, 700 to 800 in a bed, of one variety. I noticed one very fine Canna, of yellow colour, with a red centre and growing five to six feet high. Salvia splendens was a magnificent mass of glowing colour. Ageratum mexicanum, edged with Tagetes, was planted in another bed.

At one end of the garden I passed under an arch of Allamanda grandiflora in full flower, and entered the Rose garden, to find it planted with Maréchal Niel Roses, which grow like wild Roses at home. Leaving the Rose garden I passed a magnificent specimen of Poinsettia pulcherrima, about 15 feet wide and 10 feet high. It was a blaze of colour. One head of flowers measured from the inward bend of my elbow to my finger tips. I do not suppose I shall ever see such a sight again, and was very sorry that I was unable to take a photograph of this remarkable specimen.

The residence is planted with climbers, many of which were in flower. The following were amongst those noticed: Antigonon leptopus, Bougainvillaea glabra, Bignonia magnifica, Aganosma caryophyllata, Porana paniculata, Thunbergia grandiflora, Bignonia gracilis, Allamanda violacea (the purple Allamanda), Jasminum grandiflorum, J. pubescens, Ipomoea Leari, Roupellia, and Hibiscus schizopetalus.

On the Western side of the house is a terrace lawn with a specimen of Grevillea robusta, 40 feet high, planted by the late Duke of Clarence. From the terrace a series of steps leads to a lower terrace, in the centre of which is a fountain with four fine specimens of Plumbago capensis, planted on the edge of the basin, and the reflection of the flowers in the water gives a very fine effect. On either side of the terrace are flower beds of formal shape, cut in grass, and filled with Salvia splendens, Zinnias, Coreopsis, Ageratums, Balsams, and other flowers.

Dividing the terraces are fine specimens of Hibiscus sinensis brilliantissima, which were particularly noticeable. Bougainvillaea speciosa and B. lateritia, the last a lovely variety, with brick-red flowers.

Descending to the lowest terrace there were seen hundreds of Cannas in full bloom, and planted in large masses with gravel paths between the beds. At the foot of the retaining wall between the two terraces is a raised border 20 feet wide, planted to suit the season on the principle of a herbaceous border, annuals, perennials and shrubby plants being used.

This particular border in the rainy season contained plants in flower of Canna, Salvia splendens, Gaillardia, Coreopsis, Michaelmas Daisies, Gerbera Jamesonii, Cleome, Pentas carnea, Achimenes, French and African Marigolds,

FIG. 1.—ALLIUM FISTULOSUM: THE JAPANESE LEEK: MUCH REDUCED.

Cosmos bipinnatus; the orange-coloured Cosmos, named Klondike, Impatiens Sultanii, Dianthus, Balsam, Coleus and many other plants. The border was raised 18 inches and edged with an Australian Daisy believed to be Vittadinia australis. A mixed border of shrubs, Cannas and Castor-oil plants forms the boundary from the garden proper to the park.

A fine specimen of Ficus religiosa was noticed on the North side of the terrace, in a long border, on the slope of which Crinum asiaticum was planted, about 120 fine specimens producing a fine effect.

I concluded my tour by a visit to the swimming pond, which is just outside the garden proper, and, on a tropical day, with a burning sun overhead, appeared very inviting.

Strange to say, Wallflowers and bulbs for spring planting had not been grown with success, whilst, as mentioned before, one or two crops cannot be grown successfully in the kitchen garden.

Suffice to say the whole garden reflected the greatest credit on the skill of Mr. Little, who has made this garden to blossom in the wilderness. *J. Thompson, Cropwood Gardens, Blackwell.*

JAPANESE LEEK.

ALLIUM FISTULOSUM.

THE Yokohama Nursery Company have for some years offered in their catalogue circulated in this country seeds of what is described as a "long blanching Leek," and an illustration (Fig. 1) shows it to be Leek-like with respect to the lower portion or stem. Gardeners who obtained seeds and grew plants of this so called Leek discovered that it differed from the true Leek in having fistulose leaves, and on submitting examples to Kew they were informed that the plant was probably Allium fistulosum, which is the botanical name of the Welsh Onion. Growing plants of the Japanese Leek were obtained for Kew, and on flowering they were determined to be nothing more than a giant form of the Welsh Onion. The difference in size, however, is equal to that between, say an ordinary Cedar pencil and a walking-stick, as some of the Japanese Leeks were nearly two inches in diameter and 2 feet high, about 8 inches of the stem being white and Leek-like. When cooked the stems were equal to the best Leek in tenderness and flavour. Whatever the name and pedigree, there need be no doubt as to the qualities of this Japanese vegetable, and since it is quite as easy to cultivate as the true Leek is we may safely add it to our list of good garden vegetables.

In *Useful Plants of Japan*, it is stated that A. fistulosum is cultivated and known as "Negi," and that it grows about 2 ft. in height, the stem being blanched by cultivation, and that it is eaten either raw or boiled in all seasons, being at its best and sweetest in winter. Mr. R. Muraoka, an experienced Japanese gardener now in this country, on being shown the examples of Japanese Leek at Kew, said they were undoubtedly the same as the plant cultivated in Japan and known there as "Negi." De Candolle, in *Origin of Cultivated Plants*, says that A. fistulosum has been found wild in Siberia, and that it must have come into Europe through Russia in the Middle Ages or a little later. It may be that the Japanese obtained their "Negi" originally from Siberia.

I have not been able to discover how the form of A. fistulosum grown in this country came to be called Welsh Onion. According to Vilmorin, the leaves only are used for flavouring, and there are two varieties, one with coppery red membranes, the other pinkish white. Both of these are in cultivation at Kew, and they are of about the same size and I should say the same value as Chives. The Japanese Leek, if of the same origin, must have been greatly enlarged by long cultivation and selection. Seeing that this plant can not be a Leek, as it has decidedly fistulose leaves, it would be better if the name were altered to Japanese Onion. *W. W.*

TREES AND SHRUBS.

CAESALPINIA JAPONICA.

FLOWERING shrubs generally have, this year, given a splendid display of blossoms, and rarely before has Caesalpinia japonica flowered with such freedom. The inflorescences (see Fig. 2) are produced on short side growths of the current year, and each little shoot bears a raceme of from 30 to 40 bright yellow flowers delicately poised on slender pedicels. The streaks of crimson which suffuse the upper petal of each flower add considerably to their beauty. Even if it never flowered, this shrub is well worth growing for its beautiful pinnate foliage, so light and "feathery" in appearance that it

never fails to attract the attention of visitors. The tree is spreading in habit, and in our somewhat favoured climate quickly develops into a large bush. A specimen growing in poor soil on a lawn here measures over 20 ft. across, and throughout the summer is one of our most attractive shrubs. Owing to the extreme prickliness of every part of the plant, I find it necessary to support the lower branches with long poles in order that the ground beneath may be attended to with some degree of comfort to the workers.

CORNUS BRACHYPODA.

Another tree which attracts universal admiration is a well-grown specimen of the variegated form of Cornus brachypoda. This tree has attained a height of 25 ft., and I consider it the most attractive variegated tree we have. Although the position of the branches, which radiate at more or less regular intervals —sometimes in whorls—horizontally from the central trunk, would suggest a stiffness in habit, this is by no means true. The branches droop gracefully at the tips and give the tree a delightful appearance. The flowers, which are borne profusely in May, are greenish white. They are almost unnoticeable by reason of the silvery foliage, and add nothing to—indeed, when going over they rather detract from—the beauty of the tree. Unlike many variegated shrubby plants such as Acer Negundo variegata, this tree never, so far as my experience goes, develops green branches. Like many of the Cornus species and varieties, the tree is attractive in the winter from the dark red colour of its branches. *J. D. H., Royal Victoria Park, Bath.*

THE DUNKELD HYBRID LARCH, AND OTHER HYBRID CONIFERS.

At the meeting of the Royal Irish Academy in Dublin on June 23, Professor A. Henry and Miss M. G. Flood read a paper on the history and botanical characters of the "Dunkeld hybrid Larch." This is the name given by foresters to seedlings that have been repeatedly raised from the seeds of ten old Japanese Larch trees, which are growing near the mansion at Dunkeld, Perthshire, in the vicinity of numerous European Larches. Extensive plantations of these seedlings, which are very vigorous, may be seen on the Dunkeld, Athol and Murthley estates. Careful examination shows that the seedlings are intermediate between the two species in the anatomical characters of the leaves, in the colour and shape of the bracts and scales of the cones,

Fig. 2.—caesalpinia japonica: flowers yellow, the upper petals streaked with crimson (see p. 2).

in the colour of the twigs, and other details. The pollen of the European Larch is wafted by the wind on to the female flowers of the Japanese Larch. Attention was drawn to the remarkable difference in the epidermal cells of the two parent species, those of the European Larch being smooth, while those of the Japanese Larch are roughened with papillae. The papillate structure acts like the so-called "prismatic" glass, used in the windows of basements to let in an abundance of light, and explains the fact, well known to foresters, that the Japanese Larch bears considerably more shade than the European species. The Dunkeld hybrid Larch is now distinguished by the name Larix eurolepis A. Henry.

Notes were also given on other hybrid conifers, including a peculiar Hemlock Spruce introduced lately from Vancouver Island by Mr. M. Hornibrook, of Knapton, Abbeyleix. This tree is identical with the green-leaved Hemlock Spruce raised at Edinburgh from seeds collected by Jeffrey in 1851 on Mount Baker, in British Columbia, and described under various names, notably Tsuga albertiana, var. Jeffreyi, Henry in *Trees of Great Britain*, ii., 231 (1907). This tree is very rare, the only other living example being in Kew Gardens, and is plainly a hybrid, now distinguished by the name Tsuga Jeffreyi.

FIG. 3.—WEEPING STANDARDS OF DOROTHY PERKINS ROSE OVER A GROUNDWORK OF DWARF ROSES AND VIOLAS.

LIME-SULPHUR WASH.

RECENT experiments carried out at the South Eastern Agricultural College, Wye, have shown that a small quantity of saponin in solution added to the lime-sulphur wash greatly improves the spreading power of the latter, and should therefore make lime-sulphur a better protective wash. When lime-sulphur is applied to Gooseberries and to certain varieties of Apples, the dried deposit on the foliage and fruit is found to be in the form of "blotches" or small patches, even when the spraying is done very carefully and when a nozzle giving a "misty" spray is used. If, however, the lime-sulphur wash contains 0.05 per cent. of saponin it will be found that the dry sediment is in the form of a practically continuous film over the sprayed surface; consequently there is much less disfigurement of sprayed fruit. A saponin solution is now being put on the market which will enable saponin to be used at the strength of 0.05 per cent. at the added cost of 2s. 6d. per 100 gallons of wash. The object of the present note is to draw the attention of fruit-growers to this possibility of making lime-sulphur "spread" well, since soap, the usual spreading agent, cannot be added to lime-sulphur for chemical reasons. The mixture appears worthy of trial on a practical scale, and we shall be glad to receive reports from any fruit-growers using it. *E. S. Salmon* and *L. K. Wormald, Research Department, South-Eastern Agricultural College, Wye, Kent.*

THE ROSARY.

WEEPING STANDARD ROSES.

THE beauty of weeping standard Rose trees appeals to all lovers of flowers, just as does an arch festooned with Roses, simply because each has a special grace which enhances the beauty of form and colour provided by the flowers. The advent of Rosa Wichuraiana is responsible for the large addition of standard Rose trees in gardens where Roses are an outstanding feature, as well as in gardens where Roses take their place among other summer flowers. A few years ago there was a tendency to dispense with standard Rose trees and grow only dwarfs and robust climbers, but the hybrids derived from R. Wichuraiana have been found as suitable for standards as for pillars and arches—indeed, their beauty is admirably displayed when a variety like Dorothy Perkins is budded on a tall stem, and the growths have ample room to droop gracefully all round. In Fig. 3 several weeping standard Roses are illustrated, and in the foreground a fine example of Dorothy Perkins over a groundwork of dwarf Roses and Violas. There is ample room in many gardens for similar floral pictures.

FLORISTS' FLOWERS.

THE BORDER CARNATION OF THE PAST, PRESENT AND FUTURE.

IN every sphere, and upon any subject, it is customary to find adherents to two distinct views, the one set immovably confident that modern progress has been wholly and entirely for improvement, and that things were never so good as they are to-day; the other as obstinately convinced that the standard of quality and perfection in any given direction has sadly deteriorated, and that things are not what they were. In regard to flowers, the Border Carnation is an instance of these views. The prevalent idea is that the modern taste for the artistic is infinitely superior to the yearning after preciseness and perfection of form which dominated the old-time florist, and present-day opinion of even the intense enthusiasm of the men who were absorbed by the interest of a stand of paper-collared and dressed Flakes or Picotees is expressed in tones of almost pitying contempt. Still, there are some, and in the aggregate a larger number than might well be supposed, who still cherish a deep-seated love for a flower after the florist's ideal, and who look back upon the days of close-fought battles with a deep conviction that to-day is but a shadow of the glorious past.

Whenever the point is debated as to whether the cult of the artistic is the only tolerable aim of the gardener, it is incumbent to keep in mind what we owe to the old florists, who not only bred flowers of rare quality, but bred also a race of gardeners imbued with an ardent love for their calling, and an aptness for painstaking care and skill in the cultivation of all manner of plants.

Say what we may against the artificiality of the show board, the paper collar, and the dressing tweezers, we cannot withhold from their devotees the credit of having provided us with flowers of quality and refinement, and having taught us the art of growing them to the highest standard of perfection. One has only to take up some old book and read the writings of such men as E. S. Dodwell, Ben Simonite, James Douglas, and the Rev. H. D'Ombrain to grasp an idea of the depth and intensity of their enthusiasm, and a deal of interest can be found in the perusal of old catalogues compiled by such specialists as Turner, Douglas, Brown and Campbell.

The fact is driven home that so far as Flakes and Bizarres are concerned we of to-day have produced nothing to supersede or even compare with the varieties in these old lists. Even in Picotees there has been but slow progress, but so far as Selfs and Fancies are concerned we have ground for satisfaction that the present generation of specialists has given us a grand race of glorious flowers, possessed not only of beautifully modelled form and bewitching colours, but of stronger, sturdier habit, with ability to hold their flowers well up, with calyces that know not the sin of bursting, and with a freedom that makes them real garden plants, albeit their form is consonant with the canons of the florist.

Thus we have made progress, and despite the present claims to attention of the modern perpetual-flowering Carnation, the demand for "borders" is greater than ever, and the Northern, Midland and Southern sections of the National Carnation Society will convince the cynics that the old flower still holds its own.

Looking forward to the future, there are not wanting signs that changes greater than we have yet witnessed are in store. In the never ending search for novelty, we have already set out to secure a new race of intermediates between the modern, perpetual-flowering Carnation and the orthodox border type. There are those who would claim that this is in order solely to improve the border flower. To the florist of the old school such a proposition is rank heresy, and it would be contended that if either were to be improved the perpetual would gain from the border. Judging from what has already been achieved, one inclines to the opinion that the tendency is to produce a plant of free growing habit, capable of producing flowers over a period of considerably greater length than the true border, with sufficient constitution to weather an average winter, but bearing flowers which tend to coarseness and lack the form of an exhibition flower. Time alone can tell whether we can produce the perpetual-blooming plant with flowers of refined form. We must have patience. Meanwhile, there is ample scope for usefulness in regard to effect in the garden, but may we never forsake the ideal bloom for that which can give us quantity and nothing more. The exhibition flower must live for ever. *Old Florist.*

HARDY FLOWER BORDER.

CAMPANULA EXCISA.

Campanula excisa is one of the rarest of the dwarf Campanulas in cultivation, a singular little plant, just as difficult to satisfy in the way of treatment as it is uncommon in appearance. It has been fairly well described as a slender and more upright C. pusilla or C. caespitosa, with little perforations as if the flowers had been bitten, but really more pleasing than such a description would convey. The perforations, though curious, are not unsightly and add to the plant's distinctiveness, and the small bell-shaped flowers are of a pleasing violet-blue shade. The plant resents lime in any form, whilst it also seems to object strongly to absolute drought, yet dislikes much standing moisture. It is said to have a most restricted native district in Switzerland among the shingles, and these conditions are not easy to reproduce in gardens. I have grown it on a dry ledge of rockwork, well mulched with whinstone chips and watered almost daily all the summer. I have never seen it so fine, however, as in the stone "boxes" built of dry walling at Wennington Hall, Lancashire, where it had practically moraine conditions and could be kept well watered when needful. A healthy colony of plants in one of these structures showed their health and happiness by their general good appearance. There it was spreading by means of offsets. It appears to delight in sending out underground shoots and then coming up a little way from the parents, which afterwards die out, leaving the young plants to continue the race. So rare a little plant is one for the connoisseur who is undeterred by ordinary difficulties of cultivation and determined to master any presenting themselves with such a Bellflower.

NAPAEA DIOICA.

This tall-growing Mallowwort, which is but little known in gardens, makes a good back border plant for flowering in July and August. It grows six to ten feet high, has rather large, deeply cut leaves and clusters of white flowers. Individually the blooms are small, but in the mass they look well, while the plant is very distinct from those usually employed for the back row of flower borders. It is quite hardy and grows in any good soil. I grow it in sun, but it will flourish in shade, though in such a situation it flowers a little later. The plant may be propagated by division. According to the *Standard Cyclopedia of Horticulture*, this plant is not to be confounded with Sida Napaea (or properly S. hermaphrodita), of similar range and habit, and said also to be cultivated in old gardens, but which has hermaphrodite flowers.

JABOROSA INTEGRIFOLIA.

Students of descriptions of hardy flowers are frequently tempted to secure some rarity, even if of doubtful hardiness, in the hope of being more successful with it than is justified by what they may learn about it. Such a plant is Jaborosa integrifolia, and it in no way belies the accounts of its desirability by want of charm. To see its large, pure white, tubular flowers and to inhale their fragrance is enough to desire one to secure and to retain this plant—an even more intense desire than is called into being by any description of this Jaborosa. It is a plant with long, creeping stems, broad leaves, tubular white, highly fragrant flowers, and grows to a height of from 6 to 12 inches.

A knowledge of its native habitat, Buenos Ayres, raises at once a suspicion as to its hardiness, although we have a considerable number of plants from that district. In the case of J. integrifolia, however, the doubt is justified, for it is somewhat tender and requires not only a warm soil, but a sheltered, warm situation. My experience is not singular, and from reports received from friends I was fairly fortunate in succeeding in keeping it for a couple of years and enjoying a few of its exquisite flowers. I grew it in the most sheltered and warmest position I could secure, in a pocket of a rock garden, where the plant was protected from North and East winds and secured any gleam of sunshine that might come from other directions. The soil was sandy and well drained. The plant grew and flowered for about a couple of years, when one of the severe winters we have at intervals deprived me of this interesting and beautiful member of the Solanaceae. It was figured in *Bot. Mag.*, t. 3489. *S. Arnott.*

Fig. 4.—Rose Mrs. Bryce Allan; a H.T. variety of carmine rose colour.

DRY ROT IN TIMBER.

Mr. I. Mitchell, of the Imperial College of Science, Kensington, states that 50 per cent. of the wastage of timbers in the coal mines in this country is due to fungus attacks.

Probably no other fungus which attacks timber spreads with such rapidity or is more injurious than the well-known dry rot (Merulius lacrymans). It is usually found in the wood work of old houses, when the rooms are damp and not thoroughly ventilated, and particularly where green, unseasoned timber has been used in their construction. It is a popular belief that houses built on the site of old stables are most liable to have their internal woodwork attacked by this fungus, but I have never been able to substantiate the statement. Certainly, in every case where my attention has been directed to the fungus the first attacks were on the ground floor, and where the rooms were damp and badly ventilated. The woodwork of houses that have been shut up for a time would seem to be liable to attack, the starting point being the skirting-boards, after which fixed cupboards, shelves, and shutters are attacked by this insidious fungus.

Some years ago the woodwork in several rooms of the Ranger's house at Greenwich Park was attacked, and so rapid was the spread of the fungus that in a very short space of time the kitchen, the butler's room, and pantries were a scene of total destruction, the timber, especially where coming in contact with the walls, crumbling away before the persistent attacks of this vegetable pest. Being of low, spreading growth and conspicuous tints, the fungus is readily recognised while the reddish-brown spores are produced in such amazing quantities that the floor of the room in which it is found often presents the appearance of having been thickly coated with ground coffee.

The rate at which this fungus spreads would hardly be credited, as observations in the Greenwich attack proved full well; and as it can subsist for a time on the wall of a house its spreading from one piece of wood to another is comparatively easy, while it can also travel along both iron and lead pipes. Many preventives and remedies have been tried, the most successful being what is known as antinnonin, while the spreading mycelium may be held in check by applying carbolic acid. Carbolineum has been found very effective in the London area. Pinewood is most usually attacked, and in a few weeks becomes so brittle that it may be broken in small pieces by the hands with perfect ease. The diseased wood turns to the colour of old, brown oak.

The question of the decay of timber is of far-reaching importance, though with wood that is kept permanently dry, permanently submerged in water, deeply buried in soil, especially peat bog, or in cold storage, there is little to fear as the conditions essential to decay are absent.

Decay in timber is primarily due to the growth of fungi in the wood, which not only live on it, but absorb all the solid portion, and in that manner cause decay and disintegration.

The conditions essential to fungus growth are moisture, warmth and a little air. The dry-rot fungus will not thrive where there is a good circulation of air, and for this reason buildings should be thoroughly ventilated. Seasoning greatly prolongs the life of timber, for it is generally recognised that a piece of dry wood will resist the action of decay for a longer period than will that which is green and immature.

In order to prevent attacks of fungi, and particularly of that which causes dry rot, the following recommendations may be useful:—

1, use only well seasoned and thoroughly dry timber; 2, avoid so far as possible covering the woodwork with plaster or other material, and never case up timber tightly, 3, thorough ventilation, especially in cellars and underground rooms, should be provided; 4, never store timber beside other that is already attacked by fungi and keep the wood-yard clean so that infection may be prevented so far as is possible. On the first appearance of dry rot paint the timber with carbolineum. *A. D. Webster.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Budding Fruit Trees.—Fruit trees may now be budded, and the operation is invariably most successful when buds are inserted on shoots of the same year's growth. Maturity to a certain degree, however, is necessary, and budding should be performed as soon as well-developed buds can be found on the summer shoots. The work may be performed at any time during July and August, but it is best done in moist weather, as then the bark will part from the wood much more freely than in dry weather. Gross shoots should not be used, as they are soft, and bear large, immature buds. Buds taken from medium-sized shoots give the best results. The bud should be taken from a half-ripened shoot which will not extend any further. It should be plump and a wood bud. Wood buds are easily distinguished, as they are thin and pointed, whereas fruit buds are thick and round. Care should be taken to select buds from healthy trees, and they should be kept fresh by dropping them into a bucket of water as soon as they are cut out. Clean cuts and careful handling are essentials to success.

Shield Budding.—What is known as "shield budding" is the best method for fruit trees. With a sharp knife a slit should be made in the bark of the stock and another slit crosswise, the two together forming the letter T. The downward cut should be about one inch long. A bud should then be prepared by cutting off a slice of wood and bark, about one and a half-inch long, with a bud in the middle; with the flat half of the budding knife remove the wood by inserting the ivory under the bark at the top end of the slip containing the bud; with a little jerk the wood may be forced out, but the bark must not be bent, or it will be bruised. When the wood is separated the bud should be full of pith; hollow buds are not sufficiently matured. After the bud is ready, raise the bark on the stock, beginning at the angles of the T, and on both sides. Insert the shield of bark with the bud under the two angles of the bark on the stock, and slide it down to the bottom of the cut by means of the leaf stalk, which should be left for this purpose. It is necessary that the cross cut of the stock and the shield fit exactly, and when it is fitted the whole should be bound with raffia or other suitable material that will not cut the bark. Begin at the bottom, tie firmly, cross the binding above and below the leaf stalk, and leave the bud clear. All growths should be removed from the stock, so as to allow the bud every chance. The bud and stock should be syringed occasionally in hot weather.

Insect Pests.—Hot weather is favourable to the spread of all kinds of insects. A free use of the hose, garden engine and syringe is the greatest help in keeping insects in check and cleansing the foliage of the trees.

Fig. 5.—H.T. Rose Mrs. Charles Reed: colour pale cream, with pink tinting and golden yellow base

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet, Hertfordshire.

Lobelia.—The perennial Lobelias may be raised from seeds sown at the present time, and if the seedlings receive ample attention, good plants will be obtained by the end of the season. Sow the seeds in pans filled with sandy soil pressed firmly, and do not cover the seed too deeply. Place a sheet of glass over the pans, stand them in a cold frame, and shade them for some time. When the seedlings are large enough, prick them out into boxes or cold frames, keeping them well supplied with moisture and shading them in bright weather. Lobelia Victoria, L. cardinalis and L. fulgens make a brilliant display when employed in masses or intermixed with other suitable subjects. They should be wintered under glass.

Brompton Stock.—There should be no delay in sowing seeds of Brompton Stocks. I prefer to make a sowing in boxes or pans and place them in cold frames until the plants are sufficiently high, and then transfer them to well-prepared beds on a warm border, where they can be given every attention. We grow scarlet, purple and white varieties, and as the last are very sweetly scented they are useful for many purposes.

Sweet William.—Propagate a good strain of Sweet Williams either from seed or from layers; if by seed, sow at once in shallow drills 6 inches apart in an open position.

Biennials.—Prick out Wallflowers, Forget-me-Nots, Campanulas, Polyanthuses and other plants raised from seed and intended to give a good display of bloom next spring. Shady borders are preferable for most of them, but Wallflowers should be transplanted in an open position so that the plants may become sturdy and be able to withstand severe wintry weather.

Tuberous Begonia.—Supply the roots of tuberous Begonias with plenty of moisture, and give them liquid manure at intervals. These plants respond to rich feeding when well established, and especially when planted in rather light, sandy soil.

Roses.—Attend to the requirements of Roses; feed them liberally, remove suckers as fast as they appear, and keep the surface soil loose. Keep a sharp watch for maggots and caterpillars and, should mildew appear, dust the foliage with sulphur or spray the plants with Jeyes' summer wash or some other suitable fungicide.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Mexican Laelias.—The production of flowering growths upon Laelia anceps, L. albida, L. autumnalis, and L. Gouldiana, is progressing and the roots should have obtained a good hold of the new compost afforded early in the year. If the young growths now developing are well inured to sunlight, they will soon delight in as much light, air, and sunheat as it is possible for them to receive. Artificial heat and a close, stuffy atmosphere are unsuitable for these Laelias but they thrive in light and sunheat, with ample atmospheric moisture, and an abundance of fresh air both night and day. In these conditions well-established plants

will grow freely. Half the complaints about the failure of these Orchids to flower are due to insufficient light and air. Syringing overhead whenever the weather is favourable will be found highly beneficial, as the foliage and rooting materials dry quickly under the conditions advised above. The supply of water at the roots should be increased as growtn advances, and later, when the pseudo-bulbs are thickening, a liberal supply will be needed.

Odontoglossum citrosmum.—The best time to repot plants of this species is as soon as the flowers are over. This Orchid grows best suspended from the roof, in well-drained pans, and as it is not a very large or free rooting kind, the receptacles need only be large enough to accommodate the plants comfortably with about 1½ inches of margin for the compost. The latter should be rough and open in texture, and consist of about two-thirds of Osmunda fibre and one-third of Sphagnum-moss with some crushed crocks and charcoal added. Potting should be done moderately firmly and afterwards the plants should be placed in a moist atmosphere in the intermediate house, giving only enough water to keep the materials just moist until new roots begin to push out from the young growths. When new growth is vigorous, a liberal supply of water is needed. Given a light position in a house where plenty of fresh air is admitted, the plants will make vigorous and healthy growth, and complete fine, large pseudo-bulbs by the autumn.

Calanthe.—Plants of this Orchid will be growing apace and rooting freely. Healthy, vigorous specimens will be much improved by a little top-dressing of good turfy loam and chopped Sphagnum-moss, spread over the surface to the depth of half an inch and pressed rather firmly. This is a much better practice than clogging the soil with liquid manure which may make it sour. Liquid manure may of course be given, but only of a reasonable strength and always in a perfectly clear state.

Pleione.—Pleiones now require the maximum supply of water at the roots, and if no dried cow manure was used in the potting material, weak doses of liquid manure made from cow dung may be given with advantage. A light position should be afforded the plants in the cool-intermediate house, and on bright days the foliage should be syringed to keep red-spider in check.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Brussels Sprouts.—The early batch of Brussels Sprouts will need frequent hoeing to promote rapid growth. Earth the plants up in good time to prevent them from being blown over during rough winds. Watch closely for caterpillar attacks, and if the pests appear lose no time in applying a dusting of newly-slaked lime.

Celery.—The early batch of Celery will need a first earthing. Proceed by pulling the small basal leaves away, with any suckers that may have formed, and any maggot-infested foliage. Then soak the soil about the roots and earth the plants up with 2 or 3 inches of soil only, for the first moulding. Dust the foliage occasionally with soot and slaked lime.

Late Celery.—Young Celery plants require so much moisture that the surface soil becomes hard and this condition must be counteracted by top-dressings of coarse decayed vegetable matter an inch in depth. This treatment results in very free growth.

Globe Artichokes.—The plants are growing remarkably well and only need copious waterings, and a mulch of any suitable available material. The heads must be cut when ready, otherwise they will become tough; they will keep well if stood in water in a cool place.

Onions.—The next few weeks will decide the size of the Onion bulbs; the plants are now forming bulbs well and should receive liberal supplies of clear water and liquid manure. In showery weather, apply light dressings of concentrated manure; Clay's, Le Fruitier, or Bentley's are all good. Keep a close watch for mildew, and if the foliage on one single plant turns pale, and is observed and burnt before the mildew powder forms on it, the bed may be saved from infection.

Asparagus.—Where Asparagus beds have not made vigorous growth apply the hoe and afford a top-dressing of well-decayed or artificial manure. The spring-sown Asparagus should receive its final thinning, to one foot apart. Afterwards give a good watering, make the young plants quite firm by pressing the soil about them and give a surface-dressing of flaky leaf-soil.

Shallots.—Those planted early are harvesting well, and forming excellent bulbs. As soon as ready take them up, and ripen them in a dry place.

Endive.—A large breadth of Endive should be sown this week. Choose two or more sites, as from this sowing the finest heads are produced.

Lettuce.—Make weekly sowings for the next five weeks.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Plumbago rosea.—Young plants raised from cuttings this spring should have the points of the leading growths stopped to cause them to form bushy specimens. Grow them on a stage near the roof-glass, well exposed to the light, in an intermediate temperature and moderately moist atmosphere. Old plants cut back and shifted into larger pots should be making good growth; pinch the shoots in accordance with the time they are required to flower.

Gloxinias.—At this season Gloxinias are best grown in an intermediate house on a stage near the roof-glass, allowing them plenty of air during the day. Seedlings raised early this year need not be potted into larger pots than those of 5-inches diameter. Until they fully develop their flowers syringe the foliage occasionally with an insecticide to keep down pests. Water the established plants frequently with liquid manure.

Solanum capsicastrum.—This is a most useful decorative greenhouse plant for autumn and winter use. Plants raised either from seed sown in early spring or from early struck cuttings and potted now into 5-inch pots, and kept under glass until re-established, may be plunged out of doors in ashes. Old plants may be potted into larger pots and treated in the same way. Being subject to red spider they should be well watered at the roots and syringed regularly.

Tree Carnations.—No time should be lost in transferring plants that are ready for their final potting into clean, well drained 8-inch pots. Use soil of a heavy texture and add some mortar rubble and a little Carnation manure. Shade the house in which they are growing, during the hottest part of the day, and exercise care in watering until the plants are established in the fresh soil. Close the house for an hour or two in the late afternoon, and at the same time syringe the foliage and damp the paths. Attend to the pinching out of the shoots as growths develop. Stake all plants that require supports, and fumigate the house frequently to prevent insect attacks. As the plants become established, admit more air, and afford them liquid manure occasionally.

Humea elegans.—This graceful plant is very suitable for conservatory decoration, and seeds of it should be sown now, in a pan, in finely sifted, light soil. Cover the seeds lightly with soil, place the pan in a cool house or frame, and cover it with glass and paper until the seeds have germinated. When the seedlings are large enough, pot them carefully in suitably sized pots and place them on a shelf in a cool, airy house; always guard against an excess of moisture at the roots. Humeas thrive best when they are grown in a cool, airy house and the foliage kept dry.

Vallota purpurea.—This useful greenhouse plant requires comparatively little attention. The bulbs have completed their growth, therefore the water supply should be reduced. It is not necessary to repot them every year, but they should receive a top dressing of equal parts of good loam and leaf-mould, adding a little artificial manure; ram the top dressing firmly, and soon withhold water entirely until the autumn.

Palms.—All specimens requiring a warm, moist atmosphere should be syringed daily, and occasionally with an insecticide. As Palms usually have a limited root space, they require regular supplies of liquid manure. Clear soot water, applied either to the roots, or with a syringe on the foliage, is conducive to a healthy development of the foliage.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Melons.—Where a supply of Melons has to be provided during the autumn months two or three successional houses should be planted between the present time and the end of July. Seeds should be sown once a fortnight up to the middle of July, and for these sowings choose slightly larger pots than those used for those of early sowings. When preparing the beds at this season provide a good depth of prepared leaves and manure to supply sufficient bottom-heat. The loam for the beds should be heavy in texture, and to this should be added a good proportion of broken mortar rubble or old plaster and wood ash. If the house has been previously filled with Melons it should be thoroughly cleansed before replanting takes place. Plants now flowering will require similar attention in regard to the setting of the fruit as earlier crops. Where fruits are swelling rapidly the beds should be kept uniformly moist, as heavy applications of water after the plants have been allowed to become dry are liable to cause splitting of the fruits and coarse netting of the skin. All lateral growths should be stopped before they make more than two or three leaves, and if the old foliage shows a tendency to flag under bright sunshine, afford shade during the hottest part of the day. If the plants show signs of canker place around the collar a small mound of freshly slaked lime or finely powdered charcoal and keep it dry.

Fig Trees in Pots.—If the early forced trees show no prospect of another profitable crop they should be duly hardened off, preparatory to placing them outdoors in a suitable position. Continue to afford assistance to trees developing their crop of fruits, and especially those which have matured a heavy crop previously, by liberally feeding them with liquid and artificial manure and soot water. Young Fig trees raised from cuttings this season should be repotted as soon as the roots fill the pots, as should older plants, if the object is to fruit them in pots. A good proportion of broken plaster or old mortar and wood ash should be incorporated with the soil in which Fig trees are grown.

Fig Trees in Borders.—Trees which were started early in the season will have yielded their first crop of fruits, and the present is a good time to examine them and remove all superfluous growths. Cut out entire branches if necessary, use the knife as sparingly as possible, and tie in the remaining growths thinly to encourage thorough ripening of the shoots for next season's supply of fruits. Thin the second crop if the fruits are numerous and afford the trees every encouragement to make healthy and sturdy growth. The houses in which trees are yielding ripe fruits should be freely ventilated and the supply of atmospheric moisture considerably reduced, otherwise the fruits may crack and split badly. Trees started under cool treatment are now growing rapidly and require constant attention; all growths should be stopped at the seventh or eighth leaf and weakly shoots should be removed. When tying, allow sufficient space for each shoot to fully develop its foliage. During hot weather syringe the trees vigorously when closing the house in the afternoon, and damp the paths and borders frequently to provide plenty of atmospheric moisture.

APPOINTMENTS FOR JULY.

SATURDAY, JULY 5—
National Viola and Pansy Society's Exhibition, Birmingham.

MONDAY, JULY 7—
Meeting to consider the Transport Bill and Housing Bill, at the Caxton Hall, Westminster, at 8.30 p.m.

WEDNESDAY, JULY 9—
Wolverhampton Floral Fete (2 days). Cardiff and County Horticultural Society's Show.

THURSDAY, JULY 10—
National Rose Society's Provincial Show at Norwich.

MONDAY, JULY 14—
United Horticultural Ben. and Prov. Society's Committee meet.

TUESDAY, JULY 15—
Royal Horticultural Society's Committee meet. National Rose Society's Exhibition of seedling Roses; National Carnation and Picotee Society's meeting; lecture by Mr. A. D. Webster, at 3 p.m., on "Afforestation."

FRIDAY, JULY 18—
Birmingham Horticultural Society's Floral Fete at Handsworth Park, Birmingham. (2 days).

SATURDAY, JULY 19—
Croydon Horticultural Society's Vegetable and Fruit Show, in the Public Halls, George Street, Croydon. Brighton Horticultural Society's Outing.

THURSDAY, JULY 24—
Manchester Victory Flower Show, Platt Fields, Rusholme, Manchester. (3 days).

FRIDAY, JULY 25—
Horticultural Club Outing.
Midland Carnation and Picotee Society's Exhibition, Birmingham. (2 days).

TUESDAY, JULY 29—
Royal Horticultural Society's Committee meet. Exhibition of British grown Bulbs. Lecture at 3 p.m., by Mr. George Monro.

THURSDAY, JULY 31—
Maidenhead Horticultural Society's Show.

Average Mean Temperature for the ensuing week deduced from observations during the last fifty years at Greenwich 62.5°.

Actual Temperature :—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, July 2, 10 a.m.: Bar. 29.6; temp. 62°. Weather—Dull.

Silver Leaf Disease of Fruit Trees. A useful summary of our knowledge with respect to silver leaf is contained in the issue for May, 1919, of the *Journal of the Board of Agriculture.* As the writer of the article points out, the evidence that the disease is due to infection by the fungus Stereum purpureum is thoroughly well established. The fact that the silver leaf fungus attacks numerous trees in addition to Plum should be borne in mind, for the spores of Stereum purpureum produced in the dead wood of any one of its hosts may infect any other of them. Although all varieties of Plums grown in this country are said to be susceptible to attack by the fungus some, such as Rivers's Early Prolific and yellow Pershore, are highly resistant. Of those that "take" the disease very readily, Victoria is the most susceptible, with Czar a good (or bad) second.

It is stated—apparently with some justification, although further experiment is required—that Victorias grafted on a resistant stock acquire a measure of the resistant powers appertaining to the stock itself. In any case, fruit growers in the Evesham district have recently taken to using the yellow Pershore Plums as a stock for Victoria Plums. Inasmuch, however as Victorias suffer most from silver leaf after they have reached a good age—20-25 years—it is not yet possible to say whether the resistance said to be conferred by the Pershore stock on which this Plum is grafted is sufficient to render it resistant at the critical age. Although no remedy is known, trees which are in the early stage of silver leaf desease may, if properly treated, be rid of the disease. To effect this, the diseased wood must be cut out, and it is to be remembered that this must be done thoroughly. Since the fungus occurs not in the portion of the branch bearing the silvery leaves but further back, affected branches must be removed so far back that the cut surface shows no brown discolouration of the wood.

To prevent reinfection, dead leaves and trees which have begun to die back must be grubbed up and destroyed.

In cutting out branches it is to be remembered that callus formation occurs most readily at the junction of a branch with a main stem, and hence diseased branches should, if it be possible, be cut back to that point. Wounds so made should be covered at once with a dressing of Stockholm tar, for if this be not done the spores of the fungus may reinfect the tree through the wound surface. Similarly broken branches should be removed, and for the same reason, and when this is done the wood so removed should be destroyed or, at all events, not left in the plantation, for if any of the branches are diseased, the fungus may fructify on them and spread infection among the healthy trees. Other indirect means of preventing the spread of this disease are drainage, and liming : for a sour soil by interfering with the healthy growth of the trees lowers their resistance and thus renders them the more liable to attack. Pond's Seedling, Monarch, Purple Egg Plum and Damsons offer a fair resistance to silver leaf. Damascene, as well as Pershore Yellow Plum and Rivers's Early Prolific are highly resistant.

In Apples silver leaf is most apt to appear in trees which have been top-grafted and is most prevalent among those varieties which callus poorly, such as Lord Suffield, Lord Grosvenor, Mank's Codlin, Ecklinville, and Potts's Seedling. The reason for this is probably that the uncovered wound surface offers a longer period in which spores which have found lodgment may germinate and infect the tree.

Carnations and Sweet Peas at the War Horticultural Relief Show.—We learn that, as the result of sales of flowers at the Chelsea Floral Fête on June 24, 25 and 26 (see *Gard. Chron*, p. 321, June 28), the British Carnation Society is contributing £80, and the National Sweet Pea Society £45 to the War Horticultural Relief Fund.

Horticultural Club Summer Outing.—By kind permission of the President and Council of the Royal Horticultural Society, the members of the Horticultural Club will visit Wisley Gardens on the occasion of their annual outing, which is fixed for Friday, 25th inst. The party will journey by the 11.35 a.m. train from Waterloo, which reaches Byfleet at 12.22 p.m., and will proceed to the gardens by motor-cars in time for lunch. After an inspection of the gardens, tea will be provided, and the return journey will be made by the 6.36 p.m. from Byfleet, which reaches Waterloo Station at 7.25 p.m.

Fruit Crops in the Netherlands.—The Board of Agriculture and Fisheries are informed by His Majesty's Consul General at Rotterdam, in a report dated 23rd May, that the cold spring weather has in general delayed blossoming, but that the subsequent warm weather has been very beneficial, and prospects are very promising for most kinds of small fruit. Cherries are mostly good to very good. Red and White Currants are bad in the South of Utrecht, otherwise they are generally good to very good. Reports from Lymers concerning Black Currants are excellent, and, with one or two exceptions, good to very good elsewhere. Prospects for Gooseberries are very promising, though in Southern Utrecht they are reported to be bad. Raspberries, on the whole, show good prospects.

Land Settlement for Soldiers.—We are informed that the Board of Agriculture has purchased three more estates for the formation of farm settlements for ex-service men to be administered by the Board. One of these estates, consisting of 1,520 acres, situated at Berwick St. James, Wiltshire, is about 7 miles north west of Salisbury, and 6 miles from the Board's Farm Settlement at Amesbury. It includes the village of Berwick St. James, and possession will be obtained at Michaelmas next. Another estate is near Wantage, and comprises 1,000 acres. The third estate is in the Strawberry growing district of Hampshire, midway between Southampton and Portsmouth, and comprises about 1,355 acres. Several smaller areas have also been acquired, bringing the total acreage held by the Board for settlement to just over 16,000 acres and the number of settlements to 11.

The Arnold Arboretum.—Interesting details concerning the Arnold Arboretum, Jamaica Plain, Massachusetts, U.S.A., are given in the report of a committee appointed by the Board of Overseers of Harvard College, to visit the Arboretum and render a report. Founded in 1874, the Arboretum has established a world-wide reputation and attained an influence which is remarkable when it is remembered that it is the work of one generation and that it is still controlled by the man to whom it was first entrusted by the Corporation. The $100,000 given to the University by the trustees under the will of James Arnold, of New Bedford, to establish an Arboretum, has been increased by the generosity of friends to more than $700,000, and in addition to the income of this endowment between twelve and thirteen hundred thousand dollars, including the money contributed by the City of Boston, have been spent in the establishment and scientific activities of this department of the University. The collection of trees and shrubs arranged for convenient study in its out door museum is already the most important in America. The Arboretum is equipped with a library of forty thousand books and pamphlets and a herbarium of nearly two hundred thousand specimens. By its explorations, principally in North America and Eastern Asia, undertaken for the discovery and introduction of unknown plants, it has increased the knowledge of trees and introduced into the gardens and parks of the United States a large number of trees and shrubs before unknown in them. Several books prepared in the laboratories of the Arboretum have been finished during the past two years. The most important of these is, perhaps, the Bradley Bibliography, in which are found the titles of all the books and articles in periodicals devoted to the description, history and uses of woody plants published in all languages before the end of the nineteenth century. It is a book in five volumes of three thousand eight hundred and ninety-five quarto, two-column pages, and eighteen years have been occupied in its preparation. The committee reports that an immediate and pressing need of the Arboretum is the land, about sixteen acres in extent, between South Street, Jamaica Plain, and the Dedham Branch of the N.Y., N.H. and H. Railroad, the property of the President and Fellows of the University. This land is needed by the Arboretum for its large collection of Poplar and Willow trees for which it has now no proper or suitable location.

Wart Disease in Potatos.—In order that Potato growers in districts scheduled as areas infected with wart disease may make arrangements for their supply of seed Potatos required for planting in 1920, the Board of Agriculture calls attention to the fact that any approved immune variety of Potato may be planted next season. Not anticipating, however, that the supply of immune first earlies will be sufficient to meet the demand during 1920, the Board will issue to growers general licences authorising the planting in infected areas during 1920 of certain susceptible first earlies, provided the seed has been saved from the 1919 crop grown in the area. The Board is also prepared to grant special licences to bona-fide market growers who may find it necessary to import fresh seed, subject to the condition that the licences will not apply to land on which wart disease is known to be present.

Cider for Farm Workers.—The provision of cider, or other intoxicating liquor, as part

payment of wages is illegal, but it has been very common in certain districts for farmers to supply such beverages to their labourers as an "allowance" or "perquisite." Some employers in the cider districts, in view of their legal obligation to pay the minimum wage and overtime rates, are reluctant to continue the free supply of cider, and the question has arisen as to their position if they sell it to their men. In reply to an inquiry from the Agricultural Wages Board, the Board of Custom and Excise state that there is no objection to the sale of cider by a farmer to the workers on his farm, subject to payment by him of the duty on all cider thus sold, and on condition that (1) if the cider is sold in wholesale quantities, *i.e.*, in any quantity not less than 4½ gallons at any one time to one person, licence will not be required to be held by the farmer, but his premises must be registered for the purpose with the local officers of the Department in accordance with the requirements of the Statutory Regulations dated March 23, 1917, made under Section 6 of the Finance (New Duties) Act, 1916; and (2) if the cider is sold in retail quantities, *i.e.*, less than 4½ gallons, at any one time to one person, proper licences, Justices' as well as Excise, are taken out.

The Florists' Bulletin.—The first number of this publication, issued by the British Florists' Federation, contains articles and notes of interest, not only to trade florists, but to all interested in floriculture. As readers are aware, the Federation is an association of wholesale and retail florists in Great Britain, and was founded in 1917 for the purpose of protecting and encouraging every section of the Flower Trade, which is an important branch of commercial horticulture. The Bulletin points to some of the more important questions which the Federation has been successful in dealing with in the interests, not only of its own members, but of growers generally, and it gives ample evidence of the great advantage of co-operation, especially when dealing with matters through Government departments. Florists, nurserymen and market gardeners will be gratified by the approval of their achievements in helping to increase the food supplies of the country during the past five years, in a note from Dr. Keeble, Controller of Horticulture in the Food Production Department of the Board of Agriculture, where it is shown that 50 of the leading nurserymen and florists, with a total holding of 5,852 acres, devoted no less than 4,000 acres to the purposes of food production in 1918, and also that out of a total area of 319 acres of glass used for flower and plant cultivation in 1917, no fewer than 222 were devoted to food production in 1918. An article on Horticultural Sundries shows how important this branch of business is, and how closely the sundries trade has become allied to that of the growers, thus justifying the Federation's decision to include a Sundries Sub-committee and section in its activities. It is interesting to learn that a large proportion of the various goods included under the term of "horticultural sundries" came formerly from Germany and Austria, and that home-made articles are now available, rendering it unnecessary to go abroad to meet the wants of the trade in this respect. Mr. F. W. Ladds contributes an interesting article entitled "The Pot Plant in Commerce," whilst Mr. R. H. Page gives some useful hints in a note entitled "The Business End of a Florist's Shop." The war has shown the great importance of bulbs to all who are concerned in the production of flowers—especially early ones for market—and the successful efforts made by the Federation in persuading the Government to remove the embargo on certain bulbs from abroad, is amongst the most useful work it has undertaken. One of the unfathomable mysteries of the official mind was the severe restrictions imposed upon the exportation of bulbs and bulbous flowers from Guernsey, a part of the country where much money had been sunk in the industry, and this fact alone provided ample reason for the needs of such an association as that of the British Florists' Federation, which was ultimately able to persuade the authorities to relax such an unjustifiable preclusion. The Bulletin includes the Rules of the Federation, and the Report of the Committee for 1918. The membership shows a gratifying increase from 172 at the end of 1917 to nearly 300 at the beginning of 1919. The financial statement is satisfactory, for the balance sheet shows a small sum in hand; the establishment charges point to great economy in the management.

Shirley Poppies in the Pleasure Grounds.—The fine effect produced by a large bed of Shirley Poppies in association with sylvan surroundings may well be imagined from the illustration reproduced in Fig. 6. Few flowers show greater variability in colour and certainly none has more refined tones than these modern developments of a chance offspring of one of the commonest weeds of our corn fields. Although the colours and colour shades are so varied, they all harmonise so readily that there is no discord in a large bed containing all the colour variations. Shirley Poppies offer a cheap method of providing an effective summer display in a large park or garden, and in these days, when the question of cost has to be seriously considered, this fact is worth remembering.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Variability in Plants. Taking the two instances worked out by *J. F.* in his exceedingly interesting letter, on p. 321, vol. LXV., and assuming that what I may call the original primitive plant constitution of the British Paris quadrifolia contains within itself the life principles of the 7 leaved specimen named, as well as the normal 4-leaved, and that, so far, it is possible to represent this in a numerical way, then each of these would have to be regarded as intravolved from this more primitive nature represented by a least common multiple of 8 and 28, viz., 56. The question is, of course, exceedingly complex. *J. F.*'s possession of 5-leaved specimens, for instance, means that if they are included, the least common multiple would be greater still. Perhaps the general idea of an intravolutionary explanation of the facts of nature is worth consideration on its bearing upon the colours of flowers. The tricotyledonous Fuchsia seedling I named in my first contribution is now opening its flower buds. The petals appear to be white streaked with reddish-purple, though it is too soon yet to speak with certainty. But what is the original generic colour of, for instance, the Fuchsia? There are white parts in some kinds. But white is the perfect blending of all the spectroscopic colours. From white all colours can be intravolved: but the colours of the Fuchsia appear to be confined to purple, appearing in one or other of the component elemental colours of purple-red or blue. To adapt the phrase within the original primitive white, purple appears to be the "least common" generic or specific colour of the Fuchsia. In spite of the fact that yellow rays are included in the make-up of white, has a yellow tinted Fuchsia yet been observed or produced? Speaking generally, the real question involved is whether variability in plants is variability within generic or specific limits, and the explanation of the rise and existence of variability at all. Darwin assumed illimitability of variability, and therefore wrote "A well-marked variety may therefore be called an incipient species" (*Origin of Species*, p. 65, etal, 1901 edition). A theory of intravolution, such as, working from higher reaches of organic development, I endeavoured to expound in my quite forgotten and now out-of-print work *The Clue to the Ages*, so far back as 1896, assumes the permanence of the composite creative principle that intravolves the generic or specific type, within the limits of the operation of which variability is possible. As to the explanation of variability Darwin frankly gives it up. He says, "Some have even imagined that natural selection induces variability, whereas it implies only the preservation of such variations as arise and are beneficial to the being under its conditions of life" (*Origin of Species*, p. 99). And again, "Unless such (i.e., profitable variations) occur natural selection can do nothing" (ibid p. 100). On the theory of intravolution the explanation of the rise and appearance of variability is due to the outcropping of a previously latent element in the composite creative principle which, in its main line of activity, intravolves the permanent generic or scientific type. I hope *J. F.* and others will begin or continue investigations and observations to test this view. *E. Judson Page, A.R.C.Sc., Exeter.*

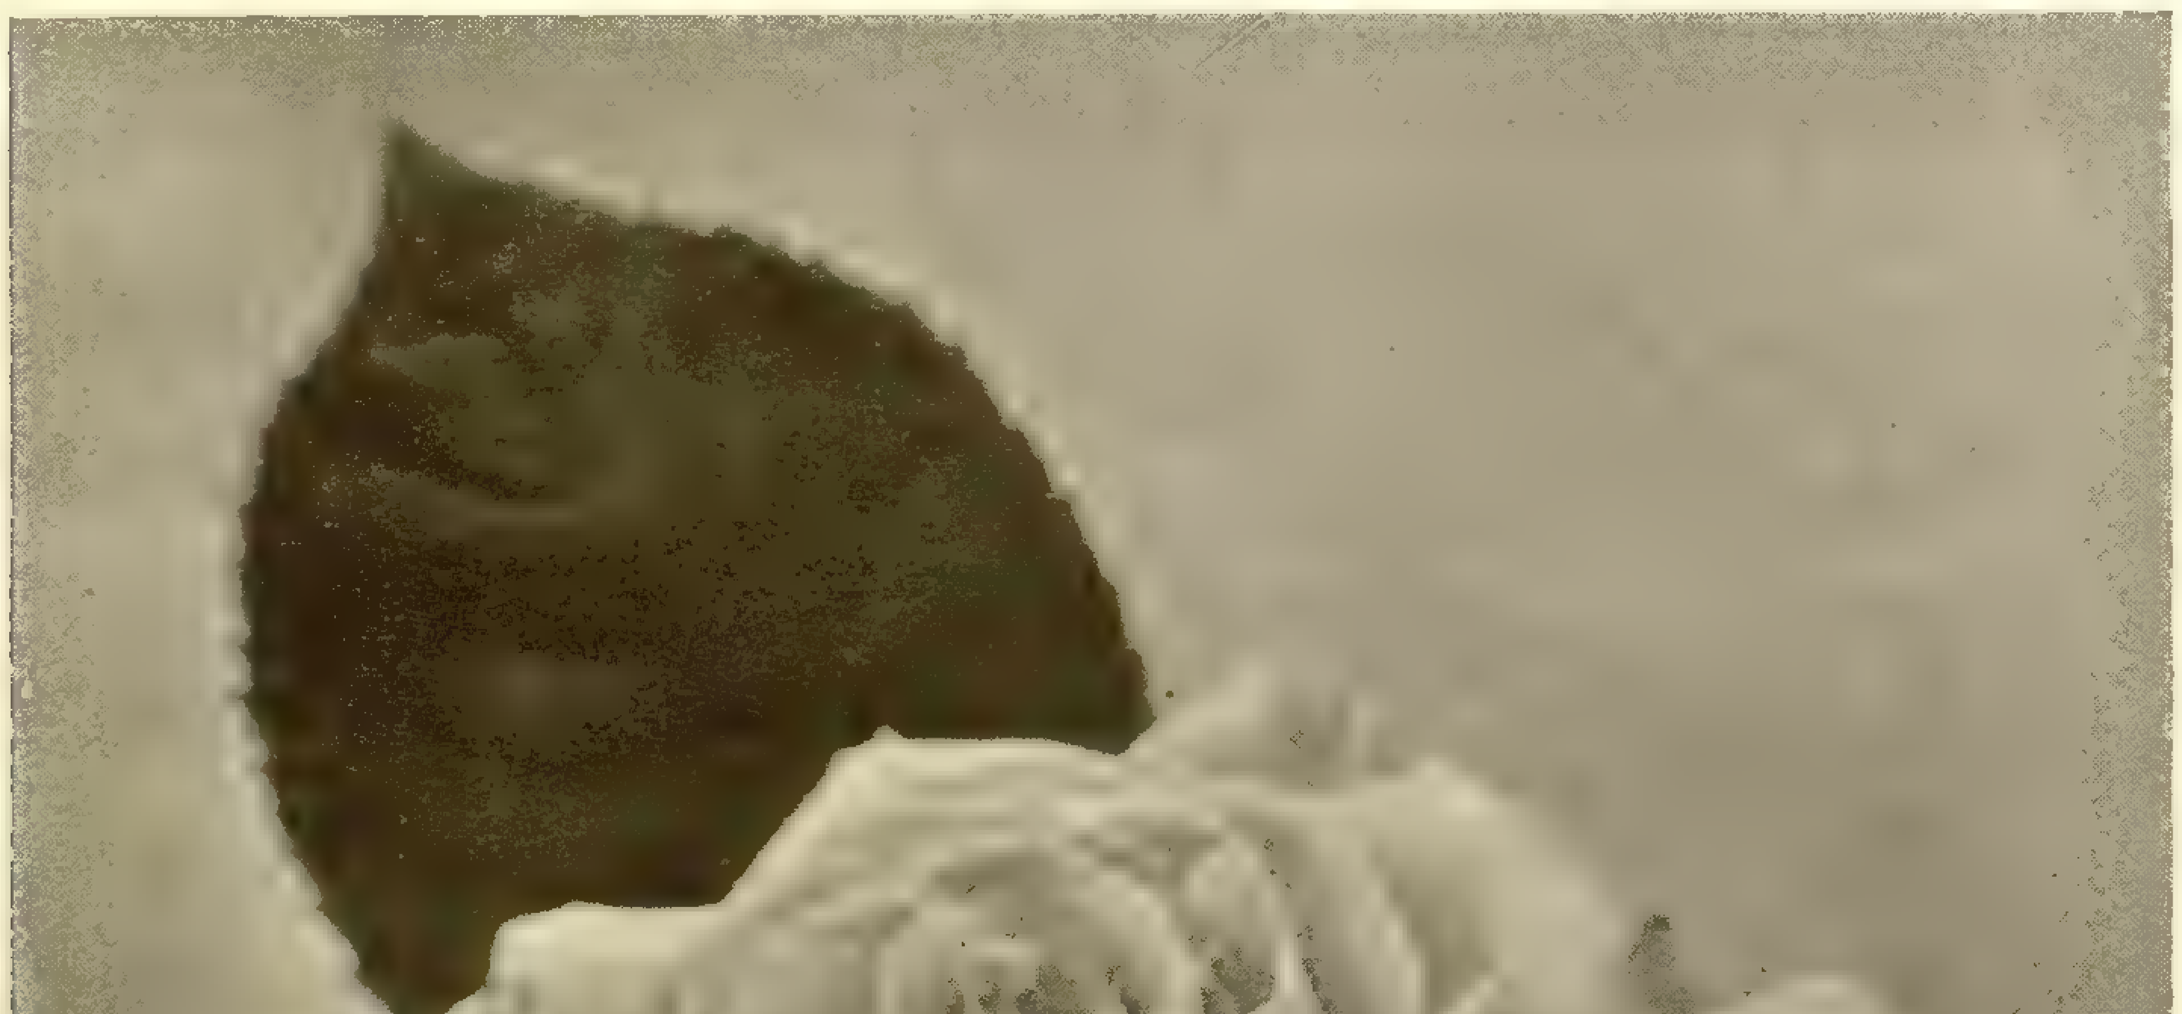

FIG. 7.—ROSE MRS. JOHN LAING: A FRAGRANT, ROSY-PINK H.P. VARIETY (see p. 13).

A Home Substitute for Dried Currants. The common Elderberry gathered ripe and preserved as a bottled fruit, may be substituted for the dried Currant sold by grocers. The flavour of many dishes is improved by the Elderberry; of such improvement mince pies form a good example. *C. Cope Cooper, Cooper's Hill, Carlow.*

Kerria japonica flore pleno (see p. 279, vol. LXV.). —The specimen of this plant mentioned by *J.P.* must be a very fine one. The height given in Nicholson's *Dictionary of Gardening* refers, no doubt, to the height of the shrub when grown in the open, but it grows much taller when trained to a wall, as in the case of Chimonanthus fragrans and many others. I have seen it on a west aspect wall in the warm valley of Mickleham, about 12 ft. high, and elsewhere on eastern and southern aspects, where it is highly conspicuous in early summer. I often recommend it to be grown on north aspects, for which few shrubs are suitable. I consider it a first-class wall shrub, even in the south, and would like to see the knife less freely used upon it. Besides the typical form there is also a variegated one, but the flowers of both are single, flimsy, and not half so ornamental as those of the double one. I think this is the reason why both are so uncommon. *J. F.*

VEGETABLES.

LATE PEAS.

IN order to obtain Peas throughout September and October, a sowing of a late variety should be made now in soil that has been deeply cultivated and well manured. I advocate growing the plants in trenches prepared as for Celery. A trench one foot wide and only moderately worked and sparingly supplied with manure will not produce late Peas of the same quality as one a yard wide and nearly as much in depth, for during continued dry weather there would be a danger of the soil drying completely in a narrow trench, and the state of the plants would be worse than if they had been grown in the ordinary way in the open quarters.

Those who wish to bring Peas through a period of drought without the plants losing their freshness and vigour must not neglect to mulch the roots in hot weather. It does not matter much of what material the mulching consists, and it may take the form of partially-decayed, flaky manure, partially-decayed leaves, or lawn mowings. I have used all these materials with excellent results. In each case the surface should be stirred occasionally with a hoe or fork to keep down weeds and ensure even distribution of the material. With all these precautions late Peas cannot survive a dry time without watering, and surface sprinklings are of no use. The soil should be well soaked, making sure that the water reaches the lowest roots. Early morning, afternoon, and evening are undoubtedly the best times for watering.

I am not in favour of burying thick layers of manure in the trenches for these late crops, for if the manure becomes dry during hot weather, the evil effects of drought become aggravated. At the same time, it must be admitted that good manure assists in retaining moisture, but it should be thoroughly mixed with the soil, not sandwiched in layers, and then there will be less danger of trouble from drought. The few really reliable late Peas include Autocrat (a well-known, mildew-resisting variety), the older Ne Plus Ultra, Latest of All, and The Gladstone. The last named is also one of the best maincrop varieties. Any of these sorts should give late supplies according to their treatment and how the season favours or disfavours the podding.

An abundance of light and air are essential to the well-being of late Peas, for when the plants are grown thickly in the rows and the latter are crowded, the crops are light and soon over. Good culture also improves the quality of the Peas. *James A. Paice.*

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 1.—Although cold weather, with a drizzling rain, prevailed on Tuesday last, there was a large attendance at the London Scottish Drill Hall, Westminster, on the occasion of the R.H.S. fortnightly meeting. There was a large display of flowers, chiefly hardy subjects, Delphiniums being very well represented. Orchids were fewer than usual. The National Sweet Pea Society held its annual exhibition in conjunction with the R.H.S. meeting; the exhibits of these flowers were very beautiful, and filled the hall with fragrance.

Floral Committee.

Present: Messrs. H. B. May (in the chair), W. J. Bean, John Green, G. Reuthe, John Heal, C. R. Fielder, Wm. Howe, J. F McLeod, J. Jennings, Sydney Morris, R. C. Notcutt, E. A. Bowles, H. J. Jones, C. Dixon, J. W. Moorman, Arthur Turner, W. H. Page, Herbert Cowley, J. W. Barr, W. B. Cranfield, W. G. Baker and E. H. Jenkins.

GROUPS.

On a floor space the ALDER RIVER COMPANY arranged a very interesting collection of Liliums and various shrubs. There were well-flowered plants of Lilium giganteum and L. Willmottiae; the latter is a slender Tiger Lily from Hupeh, and bears brilliant flowers. Not so showy, but very interesting, was the cross between L. Martagon and L. pardalinum. The result is a plant of Martagon size, habit and general appearance, bearing pendulous, bright yellow flowers which are freely spotted with chocolate. The flower buds have a rosy sheen, which is retained after the flowers have opened. L. Parryi × L. pardalinum is said to reach 10 feet in height, but is of slender habit, bearing erect, reflexed deep yellow flowers which become nearly orange at the tips and are fairly evenly spotted with chocolate in the centres. Of the various shrubs Zenobia speciosa was particularly good. (Silver Banksian Medal.)

Delphiniums were shown in great splendour by Messrs. BLACKMORE AND LANGDON, who had a variety of very fine spikes. Those of pale lilac-mauve and pale heliotrope shades—especially such as had a satiny sheen—were very charming and included Lorenzo de Medici, Mrs. Shirley, Glory and Mrs. Colin McIver. (Silver Flora Medal.)

Pale blue shades were prominent in the collection of Delphiniums shown by Messrs. KELWAY AND SON, and of these we selected the following as being unusually good varieties: Noah Tuson, Viscount Melville, Moonlight, Star of Langport and Countess of Leitrim. (Silver Flora Medal.) The Misses HANNEN and COURTNEY also showed good spikes of Delphiniums (Bronze Banksian Medal).

An interesting collection of garden Pinks, suitable for massing or bordering and in pleasing variety, was set up by Messrs. B. LADHAMS, LTD., who also displayed various other border flowers, including the beautiful white Oenothera speciosa (Silver Banksian Medal) Messrs. CHEAL AND SONS showed sprays of various flowering shrubs and Star Dahlias.

Mr. G. REUTHE had various uncommon shrubs, rock and border plants, including a neat collection of dwarf Campanulas (Silver Flora Medal).

Many pots of Streptocarpus and Gloxinia of excellent strains and showing first-rate cultivation, were contributed by Messrs. R. and G. CUTHBERT (Silver Banksian Medal), while Messrs. H. B. MAY AND SONS had their customary collection of greenhouse Ferns interspersed with flowering plants and Begonia Rex (Silver Flora Medal). Cut Carnations in variety were displayed by Messrs. ALLWOOD BROS.

The JOHN INNES HORTICULTURAL COLLEGE, Merton Surrey, exhibited hybrid Chieranthus, derived by crossing Chieranthus (Erysimum) suffruticosus with C. linifolius, and the latter species with a Blood-Red Wallflower.

AWARDS OF MERIT.

Delphinium Lloyd George A very large-flowered variety of a rich, brilliant and deep blue colour, with a white, yellow-tinted centre. The flowers are borne on long, dark pedicels, and make up a rather loose but elegant and tall spike. Shown by Messrs. KELWAY AND SON.

Bakers' Sunbeam Poppies.—A very strong growing strain of Iceland Poppies, with flowers ranging from white to deepest scarlet The flowers are large, and borne on stiff stems, often 20 inches long. There are numerous charming shades of colour in the flowers, and each bloom has the crinkled appearance that lends an added grace to these poppies. Shown by Messrs. BAKERS, Wolverhampton.

Begonia General Allenby.—A shapely, double variety of excellent form and good size. The colour is deep, rich and glowing orange-scarlet.

Begonia Queen of the Belgians.—In this double variety, the wavy petals are of remarkable size and breadth, making up an immense flower. The colour is a lovely shade of salmon pink.

Begonia Snowdrift.—A broad-petalled, white flower, of wonderfully regular form and fine substance.

Begonia Mrs. J. S. Brunton.—This variety has large and finely-formed double blooms of a rich, warm, pink colour.

Begonia King Albert.—In this variety the slightly waved petals are rounded and of great breadth. The whole flower is bold and of good form, and the colour is scarlet vermilion. All these Begonias were shown by Messrs. BLACKMORE AND LANGDON, Twerton, Bath.

Erigeron hybridus Elsie.—A dwarf plant, and therefore suitable for the rock garden. It rarely exceeds a height of 9 inches. The colour is pale lavender or light, soft rose pink, and the eye is dark yellow in the young flowers, but purplish brown in the old flowers.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), W. Bolton, Arthur Dye, S. W. Flory, Pantia Ralli, Fred Sander, R. A. Rolfe, and C. H. Curtis.

AWARDS

FIRST-CLASS CERTIFICATE.

Disa Blackii grandiflora (*Luna × grandiflora*) from Messrs. FLORY AND BLACK, Slough. The largest and best hybrid Disa. The seed parent was D. grandiflora, and the six-flowered inflorescence of the plant shown had blooms considerably larger than those of that species. The sepals are rich, rose-colour. The galea is blush white; centre spotted with crimson.

AWARD OF MERIT.

Thunia Gatton (*Bensoniae Winniana × Majoriana*) from Sir Jeremiah Colman, Bart., Gatton Park, Surrey (gr., Mr. Collier). A handsome seedling with drooping sprays of white flowers tinged with lilac. The lip is purple with raised lines of yellow papillae from the base. The sepals are four inches in length.

CULTURAL COMMENDATION.

To Mr. J. COLLIER (gr. to Sir Jeremiah Colman, Bart.) for a noble plant of Aerides odoratum album, with a spike of about forty pure-white flowers.

OTHER EXHIBITS.

Dr. MIGUEL LACROZE, Roehampton (Orchid grower, Miss Robertson), exhibited Laelio-Cattleya luminosa Bryndir variety with a very fine bronze-orange and purple flower; and Odontoglossum La Paz, a very interesting seedling of O. crispum Solum, the lip having the blackish markings characteristic of that variety.

Messrs. FLORY AND BLACK showed a selection of their hybrid Disas.

Messrs. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group of excellent hybrids, the best being two fine, deep-rose forms of Miltonia Sanderae and the massive dark-coloured Odontoglossum Triumph (triumphans × eximium).

H. T. PITT, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood) sent two charming specimens of the elegant Dendrochilum filiforme, each with about fifty slender, drooping sprays of small yellow flowers; and four plants of the dark coloured Cypripedium St. Alban (Harrisianum × Antigone).

Messrs. CHARLESWORTH AND CO., Haywards Heath, showed the beautiful white Odontoglossum crispum Lady Newnes, a charming plant of the Xanthotes class, with twenty-four flowers; they also showed the fine Laelio-Cattleya Momus, which had previously received a First-Class Certificate, and a good specimen of Cypripedium Rothschildianum.

Fruit and Vegetable Committee.

Present: Messrs. C. G. A. Nix (chairman), W. Bates, G. F. Tinley, G. Reynolds, J. C. Allgrove, F. Jordan, W. H. Divers, and Ed. Harris.

A yellow fruited Tomato named Orange Sunrise was exhibited by Messrs. CHAPMAN, LTD., Rye. The flavour is exceedingly good and the Committee recommended the variety to be tried at Wisley as to its cropping qualities. Another Tomato, named Tony, of dull-red colour and very regular shape, was exhibited by Mr. ST. JOHN PAYNE, Stoneleigh Nursery, East Grinstead.

Mr. H. MORTIMER, Rowledge, Surrey, exhibited splendid Cucumbers of the varieties Delicacy, Sensation and Improved Telegraph. The first two had already received First Class Certificates and the awards were confirmed by the Committee on this occasion.

Messrs. THOMAS ROCHFORD and Sons Ltd., Turnford Hall, Broxbourne, Hertfordshire, exhibited a large number of pot plants of Tomato Ailsa Craig Improved. A Cultural Commendation was awarded for the general excellence of the plants and the variety was recommended for trial at Wisley.

Scientific Committee.

JUNE 17.—*Present:* Messrs. E. A. Bowles, M.A. (in the chair), E. M. Holmes, W. Hales, J. Fraser and F. J. Chittenden (hon. sec.).

Arabis glabra.—MR. MARSDEN JONES sent a specimen of A. glabra from Tilston, Cheshire, a new locality for this plant.

Hybrid Narcissus.—He also sent photographs of the bulbs of N. Bulbocodium × N. "Emperor," of which other photographs were shown at the last meeting.

Foliar sepals in Rose.—MR. C. F. PRATT, of Acton, sent a Rose in which the sepals had grown out almost to the size of foliage leaves.

Primula pulverulenta.—MISS NORTON, of Dolcorsllwyn Hall, Cemmaes, sent a specimen of P. pulverulenta with the note that "Three years old plants have about fifteen flower spikes averaging three feet in height, the best half-dozen of which grew to about four feet in height."

Plants causing irritation.—MR. E. M. HOLMES mentioned a case of skin irritation caused by handling the Giant Cow Parsnip, Heracleum giganteum. MR. BOWLES also referred to cases of severe skin irritation brought about by handling Rhus vernicifera.

Variegation of Rose Leaf.—MR. HOLMES showed an interesting example of variegation in the Rose in which one half of a foliage leaf was yellow, the other half green.

ROYAL AGRICULTURAL.

JUNE 24-28.—The Royal Agricultural Society's Provincial Exhibition held at Cardiff on these dates included a horticultural section as usual.

In addition to the horticultural section proper, many of the chief seed firms included exhibits of a horticultural nature in their special tents and pavilions. Messrs. SUTTON AND SONS had quite a botanical and entomological museum, in which were displayed mounted specimens of garden and farm pests, both dried and growing examples of forage plants, injurious weeds, etc. Floral features on the stand included Sweet Peas, Clarkias and other annuals. There were also fine dishes of Tomatos, Peas, Beans, and other vegetables.

Messrs. DICKSON, BROWN AND TAIT decorated their pavilion with rambler Roses, Carnations and Ferns, and also showed examples of their particular strains of vegetables. Messrs. DICKSON and ROBINSON made a special feature of various types of pasture plants and grasses. They had also mounds of Delphiniums, Carnations, and Hydrangeas.

Vegetables were the central feature of Messrs. JAMES CARTER AND Co.'s stand. They also had finely-flowered Crassulas. Messrs. EDWARD WEBB AND SONS, LTD., showed a mass of Clarkias, a choice selection of Sweet Peas, various types of pasture grasses, and an assortment of excellent vegetables, among which Peas were a strong feature. Other occupants of similarly interesting stands were Messrs. TOOGOOD AND SONS, Messrs. BLATCHFORD, the AGRICULTURAL WHOLESALE SOCIETY, and the HARDY PLANT NURSERIES, Llanishen.

There has always been a great deal of horticultural interest at the Royal Agricultural Society's shows, more especially in the economic phases such as food crops, labour-saving implements and chemical aids to good husbandry.

Of late years, however, a separate horticultural section has been provided, and a flower show of no mean standard had for a few years prior to the war shown annual progress and development. It was therefore with high expectations, not unmixed with curiosity, that we waited to see how this feature fared at Cardiff on the first post-war occasion. It is gratifying to be able to record a successful show, although it must be admitted the display was somewhat smaller than formerly, owing, in some measure, to the counter attraction of the War Relief Show at Chelsea. Few competitive classes were provided, the greater proportion of the exhibits coming from the Trade. The class for a group of fine ornamented stove and greenhouse plants was supported by three entries, and although there were not the fine big plants we were wont to admire the groups were rich in colour and replete with Orchids and other subjects of high quality. Messrs. J. CYPHER AND SONS, Cheltenham, proved invincible, and carried off the highest honours with an undulating bed of ferns, small Crotons, and Caladiums, tastefully interspersed with Cattleyas, Odontoglossums, Ixoras, and finely-berried Nertera depressa. The whole was surmounted by an arch, beneath which was a mass of profusely - flowered Clerodendrons; 2nd, Mr. W. A. HOLMES, Chesterfield; 3rd, SIDNEY H. BYASS, Esq. (gardener, Mr. R. German), Llandough Castle, Cowbridge, Glamorganshire.

A wonderfully fine group of tuberous Begonias from Messrs. BLACKMORE AND LANGDON, Bath, occupied a commanding position in front of the entrance to the tent. Mounds of the coral pink variety Mrs. W. Cuthbertson occupied the foreground, with baskets of pendulous varieties overhead. Mrs. J. S. Brunton and Mrs. H. Lunt were other choice varieties in the group which was awarded the first prize. The same exhibitors had a grand display of Delphiniums, which secured first prize, and an extra award of a Gold Medal was given for the combined exhibits.

Messrs. ALEX. DICKSON AND SONS, LTD., Hawlmark, Belfast, made a notable display of Roses and Sweet Peas. Several of the Roses were new and unnamed seedlings, but big sheaves of Mrs. C. V. Haworth glowed with wonderful orange and flame colour. The Sweet Peas included Hawlmark Pink, Daisy, Cherub (a good Picotee-edged cream ground), and the large white Constance Hinton. Other fine Sweet Pea exhibits came from Messrs. E. W. KING AND Co., Coggeshall, who were first in competition, and from Messrs. BIDE AND SONS, Farnham, and Messrs JARMAN AND Co., Chard, who also showed fine Roses and a few examples of their well-known strain of Sweet Sultans. Quite distinct from the rest of the show and decidedly good was an arrangement of choice alpines among weathered stones, which came from Messrs. BROADHEAD AND SONS, Wooldale, Thongsbridge, Yorkshire. The subjects were of superior order, and calculated to interest the enthusiastic collector of rarities rather than the seeker after bold effects. Campanula Raddeana, Allium narcissiflorum, choice Saxifragas, and the little Gypsophila cerastoides are instances of the kinds of plants used. One of the finest forms of Scabiosa caucasica we have seen was shown by Messrs. W. J. GODFREY AND SON, Exmouth. It is named Pride of Exmouth, and has remarkable breadth of petal and rich lustrous colour.

A class in the schedule which brought three entries was for a collection of Hardy Perennial plants and blooms arranged on ground space 30 feet by 10 feet to represent a growing border. This should be a very attractive and instructive class, but the tendency is still to make too dense a display, and to provide a great mass of colour rather than natural effect. Of the three exhibits Messrs. W. ARTINDALE AND SON had the boldest display, and showed excellent Paeonies, among which Madame Chauny, M. Levique, a clear flesh-coloured variety, and the pure white Duchesse de Nemours were conspicuous. Lilium Szovitsianum, the white-flowered Delphinium Moerheimii, and the quaintly beautiful Golden Erigeron Asa Gray were other good things. This collection was awarded first prize. The judges gave the second prize to Mr. C. J. ELLIS's exhibit, which was arranged in the style one might expect a border to be planted; the third prize was awarded to Messrs. HARKNESS AND SONS. This appeared to us a case of divided judgment, for if the idea was to make a literal interpretation of the schedule the exhibit of Mr. Ellis was the only one that could be considered correct, whilst if the bold effect of Messrs. Artindale's gained for it pride of place, the same standard would have placed Messrs. Harkness second instead of third. Among Mr. Ellis's best subjects were Incarvillea Delavayi, Erigeron Mrs. B. Ladhams, Hypericum Ellisiana, with starry yellow blossoms, Sweet Williams, and a Viola named Mrs. V. T. Hill, with creamy, mauve-edged flowers. Messrs. Harkness made fine use of Oriental Poppies and Lupins, and among the latter was one named Royal Favour, of amber colour.

NATIONAL SWEET PEA.

JULY 1.—It was only after very careful consideration that the Committee of the National Sweet Pea Society decided to hold an exhibition this year. It was agreed that no cash prizes should be offered and only the Society's cups and challenge plate competed for. In spite of trying weather the decision was justified by the fine display, which filled about half of the London Scottish Drill Hall, Westminster, and attracted a large company of enthusiasts.

Competition was most keen, and the entries in the classes, together with the trade displays, provided a fine show that was distinctly reminiscent of old times in all but extent.

TRADE EXCLUDED.

In the Eckford Cup Class, Mr. W. H. HOLLOWAY, Percyville, Port Hill, Shrewsbury, won first prize with charming flowers of Valentine, Audrey Crier, Lady Evelyn, Mrs. Tom Jones, Mrs. H. C. Stapleton, Edsom Beauty, Suttons' Cream, Lady Miller, Prince George, Edward Cowdy, Jean Ireland, and R. F. Felton. Mr. Holloway has now a grand chance of winning this fine Cup outright. Mr. F. W. FRANK (gr. Mr. Humphrey), Loampits, Tonbridge, was placed second.

In the Sutton Cup Class for eighteen bunches, there were two entries, and the Cup was won by Sir RANDOLF BAKER (gr. Mr. A. E. Usher), Ranston House, Blandford, with beautiful blooms of Faith, Elegance, Mrs. A. Hitchcock, Hilda, R. F. Felton, Alex. Malcolm, Adelaide, and Royal Purple. Mrs. FARNHAM, The Heights, Witley, was a good second. The J. K. King Cup for a dozen bunches, distinct, was won by Mr. PHILLIP (gr. Mr. R. Goliah), Astley Grange, Shrewsbury, with good blooms of Constance Hinton, Warrior, Elegance, Alex. Malcolm, Royal Purple, and Felton's Cream; 2nd, Sir RANDOLF BAKER.

OPEN CLASSES.

The Burpee Cup Class for a table display of waved Sweet Peas on a space 8 ft. by 3 ft., has been a feature of the N.S.P.S. shows for many years. On this occasion there were three competitors, and the premier position was filled by Messrs. E. W. KING AND Co.; their exhibit was rather crowded, but the flowers were very fine, especially the baskets of Attraction Improved, their new variety, Gladys, Mrs. H. Hitchcock, Royal Salute, Mavis, Rosabelle and Lavender; 2nd, Mr. HOWARD S. BUTTON, Horsons, Northwood; 3rd, Messrs. BIDE AND SON.

SINGLE-HANDED GARDENERS' CLASSES.

The Bide Challenge Cup offered to single-handed gardeners for a dozen bunches, distinct, was won by Mr. J. W. WELLICOME, Queen's Way, Gerrard's Cross, and he had good vases of Rosabelle, Adelaide, Hercules, and Jean Ireland. In the same section Dr. S. LEGGATT, Salcombe, Harpenden, won the Perkins' Challenge Plate for nine bunches (including a grand bunch of Dobbies' Cream); Mr. H. A. PERKINS (gr. Mr E. Grout), Lane House, Bognor, second. The Breadmore Challenge Plate offered in the same section for the best six bunches, distinct, was won by Mr. G. J. PRYOR, Preston, Hitchin, with long-stemmed spikes of bloom.

SMALL GROWERS' CLASSES.

In the division for small growers, i.e., those growing not more than 350 plants of Sweet Peas, the E. H. Christy Challenge Cup for the best dozen bunches, distinct, twelve sprays each, was won by Mr. F. J. ROGERS, St. Hilda, Yarmouth, Isle of Wight, with a very fine set of Anglian Star, Princess Mary, Warrior, May Unwin, Mrs. A. Hitchcock, Royalty, Royal Salute, King Mauve, R. F. Felton, Progress, and Constance Hinton; Mr. J. H. WILKS, Highfield, Brockenhurst, second. Mr. E. WILLIS, Swinton, third.

Six bunches, distinct, and representing as many separate colour classes, were the requirements in the competition for the Walter Voss Challenge Cup. There were four competitors, and Mr. F. J. ROGERS, Isle of Wight, was awarded the first prize for beautiful blooms of Warrior, Constance Hinton, Alex. Malcolm, Royalty, Hercules, and Jean Ireland; Mr. Rogers is a very capable grower. Mr. E. WILLIS came second, and Mr. R. F. BARKER, Rookfield Avenue, Muswell Hill, was placed third.

AMATEURS CLASS.

Mr. TOM JONES, now a veteran and successful competitor, won the Hawlmark Cup in the special Amateurs' division. The class is for a dozen bunches, distinct, and Mr. Jones had, as usual, a superb lot of flowers. The varieties staged were Constance Hinton, Liberty, Royal Purple, Jean Ireland, Audrey Crier, Lady Evelyn, R. F. Felton, Mrs. A. Hitchcock, Edsom Beauty, Lady Miller, Charity, and Hawlmark Cream.

NON-COMPETITIVE.

Messrs. DOBBIE AND Co. filled a large space with well-grown Sweet Peas, presented in large variety. At the back they staged tall stands of Jean Ireland, Royal Purple, the brilliant Alex. Malcolm, Mrs. Tom Jones, Mrs. A. Hitchcock and Constance Hinton. In front of these were vases of varying height, filled with such beautiful sorts as The President, Melba, Mrs Cuthbertson, Duchess of Portland, Tea Rose, R. F. Felton, Dobbies' Orange and Dobbies' Cream (Gold Medal).

Mr. GEORGE HERBERT, Duck's Hill, Northwood, had a pretty exhibit, wherein Hercules, Peace, Moneymaker, Elsie Herbert, Constance Hinton and R. F. Felton were the leading varieties, but the flowers were scarcely set at their best (Silver Gilt Medal). Messrs. E. BIDE AND SONS' display, a trifle thin, contained good representations of Princess Mary (blue), Jean Ireland, Dobbies' Cream, Fiery Cross, Bide's Cream, and the dark maroon King Manoel (Silver Gilt Medal).

In Mr. ROBERT BOLTON's large and tastefully-arranged exhibit the varieties Valentine (pink), Charity, Tangerine, and Mrs. Tom Jones, were shown in bold masses, while the new Gold Medal, cream pink; Cheerful, deep cream pink; Verdun, deep rose-red; and Magic, blue and rose; were all well represented by large vases of excellent flowers (Gold Medal). Mr. J. STEVENSON showed several of his new seedlings; Bacchus, Italia and Red Ensign were distinct sorts.

Messrs. ALEX. DICKSON AND SONS contributed a particularly fine group of Sweet Peas, which, in arrangement, colour, variety and size of blooms was first-class. The use of spikes with buds just expanding among the fully-opened flowers lent additional grace to the display.

Hawlmark Pink occupied the central position, and there were four large stands of it. Daisybud, the new blush pink; Hawlmark Cream, Elegance, Royal Purple, Brocade, new, rose and pink; Mrs. Tom Jones, blue; and Constance Hinton, white, were other varieties displayed in stands, vases and bowls, the whole making a beautifully bright and fragrant exhibit (Gold Medal).

CITY OF LONDON ROSE.

June 27.—After their show of 1916 the members of the above Society decided to suspend their shows for "the duration," and to devote their energies to food production. Now that happier times prevailed, it was felt that the Cannon Street Hotel exhibition should be revived, and on the 27th ult. the Lady Mayoress opened a very successful show. Lady Marshall, regretting that the Lord Mayor was indisposed, expressed her surprise at the excellence of the many blooms and congratulated the Society on its renewed activities, which she hoped would not again be interrupted.

Open Classes.

The Nurserymen's Challenge Trophy was won by Messrs. D. Prior and Sons, with a fresh and even collection of good blooms. The best examples were of Mme. Jules Gravereaux, Elizabeth (an old but excellent pink Rose), A. Hartmann, Bessie Brown, Caroline Testout and Mrs. Dudley Cross. Messrs. Alex. Dickson and Sons, who were a good second, displayed several new crimson varieties. Of these, John Ness (a very fragrant, velvety crimson), Capt. Kilbee Stuart (bright crimson), and Gwladys Richards were particularly good.

Messrs. Alex. Dickson and Sons were placed first for 12 varieties, three blooms of each, for a splendid collection. The triplets of H. V. Machin, A. Hartmann, Gorgeous and Capt. Kilbee Stuart were excellent. Messrs. D. Prior and Sons were second, showing fine sets of P. Lambert, white Maman Cochet and Mme. Jules Gravereaux. Messrs. Prior were awarded first prize for 18 Teas and Noisettes, showing clean blooms of Maman Cochet, Mrs. Dudley Cross and Mme. Jules Gravereaux.

The class for 12 blooms of Roses, "introduced 1915 to 1918," was decidedly poor. Messrs. Alex. Dickson and Sons were alone and were awarded the first prize. The only varieties of merit were Margaret Dickson Hamill and Frances Grant, two orange-shaded varieties. But Messrs. Dickson's Roses were seen to much better advantage in the classes for 18 bunches of decorative Roses and five baskets of cut blooms, where they worthily won the first prizes. In each class Sunstar, Lady Pirrie and Mme. Ravary were represented by splendid blooms.

Amateurs' Classes.

For the third time in succession Mr. H. L. Wettern won the Open Amateur Trophy, and on the present occasion he had 24 splendid blooms, the very best being François Michelon, Mrs. Cynthia Forde, J. B. Clark and Geo. Dickson. Mr. Wettern also won first prize for (*a*) 9 blooms of one variety, showing excellent flowers of A. Hartmann; (*b*) 6 bunches of decorative Roses; (*c*) 12 blooms, distinct, winning for the second successive time the City of London Challenge Trophy; (*d*) the Challenge Cup for 12 bunches of decorative Roses; and (*e*) 9 vases of decorative varieties.

The Rev. F. R. Burnside, Great Stambridge Rectory, Rochford, added to his old-time successes by showing the best (*a*) 8 varieties, 3 blooms of each; (*b*) 12 blooms, in not fewer than 9 varieties, of Teas or Noisettes. In each class he had excellent blooms of White Maman Cochet. Mr. G. C. Sawday had the best 12 blooms distinct, and Mr. F. J. Underhill was the most successful competitor in the class for 4 blooms of one variety shown in a vase and 3 blooms shown similarly.

In the City Members' Classes, besides Mr. Wettern, who won the championship, Mr. John Hart, Mr. A. C. Brown and Mr. R. de Escoffet showed particularly good blooms, and in the class for growers of fewer than 500 plants Mr. J. W. Burgess had 9 excellent blooms.

In the Metropolitan Classes the Challenge Cup was won by Mr. R. de Escoffet, with splendid blooms of Mrs. John Laing, a variety illustrated in Fig. 7, George Dickson and Florence Forrester. The Inner Suburbs Cup was won by Mr. D. Robbins, East Dulwich.

The Ladies' Artistic Classes were particularly good. Mrs. A. Brown, Brookes Lodge, Reigate, and Mrs. Underhill, Plough Lane, Croydon, won the first prizes with very tasteful arrangements.

Medal Blooms.

N.R.S. Silver Medals were awarded for the following blooms, as being the best in the various sections:—Victor Hugo, shown by Messrs. Alex. Dickson and Sons; George Dickson, by Mr. G. C. Sawday; Snow Queen, by Mr. A. E. Coxhead; George Dickson, by Mr. S. F. Gregg; and J. B. Clark, by Mr. A. E. Coxhead

Trade exhibits were arranged by Mr. Walter Easlea, who, in Glowworm, showed a charming coppery-orange single-flowered Rose; Rev. J. H. Pemberton and Mr. T. P. Edwards.

ROYAL SCOTTISH ARBORICULTURAL.

Aberdeen Branch.

The excursions, so greatly enjoyed in pre-war days, of the members of this branch of the Society, were resumed on Thursday, June 19, when a visit was made to the woods of Gordon Castle, the premier Scottish seat of the Dukes of Richmond and Gordon. There was a record attendance, over 70 being present, representing Kincardineshire in the south to Nairnshire in the north. Mr. Irvine of Drum, Drum Castle, Aberdeenshire, president of the branch, headed the party, and others present included the Earl of Leven and Melville (Nairnshire), Sir John Fleming of Dalmuinzie (Aberdeenshire), Mr. Nicol of Ballogie, Colonel McConnochie of Knowsie, Mr. Muirhead (commissioner to the Duke of Richmond and Gordon, Fochabers, etc.). A certain *éclat* was given to the gathering by the presence of Mr. R. L. Robinson, London, a member of the Interim Forestry Authority, who happened to be sojourning in the north.

Leaving Aberdeen at 8.5 a.m. in special saloon carriages, and in charming weather, the party soon covered the sixty odd miles to Fochabers. Here the first visit was made to the extensive nurseries of Mr. William Christie, who, with his son, extended a hearty welcome to the party, and showed much that was interesting and instructive. Mr. Muirhead, commissioner to his grace the Duke of Richmond and Gordon, who had with him Mr. John Clark and Mr. Charles Webster, his Grace's head forester and head gardener, then led the way to the grounds of Gordon Castle, where the last-named gentlemen proved thorough guides, philosophers and friends to the party. A feature greatly admired was the magnificent specimens of Pines to be seen on every hand, and the party gathered round the remains of one well named the "King of the Forest," and which was laid low in the great gale of 8th November last. Some idea of this gigantic Scots Pine may be realised from its measurements. At the ground it measured 13 feet 10 inches in circumference; at 5 feet up, 11 feet 9 inches; at 24 feet up, 9 feet 5 inches; and at 46 feet up, near where the first branch appeared, 8 feet 10 inches. There were no fewer than 487 cubic feet of marketable timber in the stem. The tree was 161 years of age. Many other fine Scots Pine were also seen, several of which rose to a height of over 100 feet, and with cubic contents estimated as almost equal to that of the "King of the Forest." Many of these fine trees, Mr. Muirhead explained, were planted by the fourth Duke of Gordon, and were acknowledged by experts in forestry as among the finest in Scotland—an opinion heartily endorsed by the excursionists.

The company was then taken to a piece of bare moorland hillside where the Duke intended planting some 200 acres. Here the President explained that Mr. Clark, the Duke's forester, was anxious to have the opinions of the party as to the trees most suitable. After a keen discussion, in which many took part, it was agreed that Sitka Spruce, Douglas Fir and Scots Fir would be the most suitable. At this stage of the proceedings a meeting of the branch was constituted, the chair being a fine bank of heather, with the audience seated on similar "benches." The hall was that lovely country-side, well named "Bonnie Strathspey." Here the President took occasion to extend a hearty welcome to Mr. Robinson, of the Interim Forestry Authority, and expressed the party's pleasure in being accompanied by one so prominent in forestry matters. Mr. Robinson, after returning thanks for the hearty welcome and kind hospitality he had received, said, regarding the discussion they had just had over the planting of moorland, he did not know if they had any experience with the Corsican Pine in the north, but experience had shown that it grew twice as quickly as the Scots Pine, and, proportionately, they would get a bigger return, though not twice as much. Referring to the Interim Forestry Authority, set up last November in the anticipation that the day after the morrow would see it made a permanent authority, Parliament, he said, had been so busy that no time had been found to deal with forestry. Shortly, however, legislation would be introduced in the House of Commons, and they hoped it would go through. One feature of it, he thought, would be that one central authority would be set up for the whole of the United Kingdom. That did not necessarily mean that forestry matters, such as they had been discussing, should be specially controlled from London, but merely that a general policy on the future adequate supply of timber should be dealt with as a whole, and that a Northern Section would be dealt with by Scottish foresters, say, in Edinburgh, or some other convenient place. If they had such a central authority it could do a great deal in a few years. The main objective of forestry was to grow timber, and it was because that objective was lost sight of that the main objection to a central authority arose. In the first instance, there could be no doubt a central authority would bring forward matters better than a few authorities dealing with the matter. The sectional authorities would, however, follow in due course for special purposes.

Thereafter the company visited the sawmills and the ground of the once Bog o' Gight. Luncheon was served at the Castle, where reference was made to the kindness extended to the party by the Duke. In the afternoon the magnificent avenues, gardens, hothouses and orchard of Gordon Castle were inspected under the genial leadership of Mr. Charles Webster, the Duke's veteran head gardener. The fine paintings, armour and antique furniture in Gordon Castle were also greatly admired, and at the close of "a perfect day" the foresters, after grateful thanks to all who had contributed to the success of the excursion, returned, highly gratified, to their homes. Mr. George D. Massie, advocate, Aberdeen, hon. secretary of the branch, made the arrangements, which were carried out with admirable smoothness.

WINDSOR, ETON AND DISTRICT ROSE AND HORTICULTURAL.

June 28.—After a lapse of two years, the above Society resumed its annual show, which, by permission of the King, is held in the Slopes of Windsor Castle. His Majesty is a liberal patron of the Society, for he provides the show ground, a challenge cup (which draws exhibitors from all over the country), and gives a generous annual subscription. During the afternoon H.R.H. Princess Alice, Countess of Athlone, accompanied by her little daughter, Lady May Cambridge, visited the exhibition, showing evident interest in many of the collections and expressing great admiration.

It was a larger show than might have been expected, and the quality of the blooms, particularly those with which Dr. Lamplough won the Windsor Challenge Cup, was particularly good. In spite of the counter-attraction of the Eton *v.* Winchester cricket match, there was a very good attendance.

Open Rose Classes.

The King's Challenge Cup, offered for annual competition for the best 48 blooms, distinct, was won by Messrs. Alex. Dickson and Sons with a fresh and even collection. The very best

blooms were of Florence Forrester, Mrs. Campbell Hall, Mrs. C. Forde, Gladys Holland and François Michelon. Messrs. D. PRIOR AND SON, who were a close second, had particularly good blooms of Mrs. Dudley Cross, Mrs. Foley Hobbs, White Maman Cochet and Florence Pemberton. Third, Messrs. B. R. CANT AND SONS.

The only exhibit of 18 Teas or Noisettes was by Messrs. D. PRIOR AND SONS and was awarded the first prize. It included well-formed blooms of Mrs. Dudley Cross, Molly Sharman Crawford, and White Maman Cochet.

There were three exhibits of 12 distinct varieties, 3 blooms of each, and this was a particularly strong class. Messrs ALEX. DICKSON AND SONS were first, showing splendid triplets of Mrs. John Laing (this variety is illustrated in Fig. 7), Snow Queen, Arthur Machington (a very fragrant new crimson Rose), John Ness and Capt. Kilbee Stuart. In the second prize exhibit of Messrs. D. PRIOR AND SONS there were good sets of Bessie Brown, Maman Cochet and Mildred Grant. Third, Messrs. F. CANT AND CO.

Showing splendid blooms of Mrs. Elisha Hicks, Mr. E. J. HICKS was deservedly placed first for 12 blooms of any H.P. or H.T. variety. Messrs. D. PRIOR AND SONS were alone in the class for 12 blooms of any T. or N., but fully deserved the first prize for their fine dozen of Mme. Jules Gravereaux. Messrs. PRIOR won first prize with very even blooms of Bessie Brown and Ulrich Brunner in the class for 12 blooms each of any crimson and any white Rose. Messrs. F. CANT AND CO. were second with larger but weather-stained blooms of Edward Mawley and Florence Forrester.

Mr. G. LILLEY won the first prize easily in the class for 12 bunches of decorative Roses. He had excellent bunches of Mme. E. Herriot, Ophelia, Mme. A. Chatenay and Lady Pirrie. Second, Messrs. F. CANT AND CO.

Amateurs' Classes.

That well-known amateur Rosarian, Dr. C. LAMPLOUGH, was particularly successful. The 24 blooms with which he won the Windsor Challenge Cup were excellent, Modesty being selected for the medal offered for the best Rose in the show. Other splendid blooms were Mrs. Myles Kennedy, Mrs. Chas. Russell, Snow Queen and Dean Hole. Second, Mr. F. DENNISON, who was unfortunate in finding Dr. Lamplough in such fine form. He had very good blooms of J. B. Clark, Snow Queen and H. V. Machin. Dr. Lamplough also won first prizes for (*a*) 8 varieties (3 blooms of each), (*b*) 12 Teas or Noisettes, and (*c*) 12 blooms (distinct), with splendid collections.

In the class for growers of fewer than 1,000 plants, Mr. G. SAWDAY had the best 12 blooms and also the best 18 blooms in the premier local class.

Mr. C. ROMAINE was first with 6 blooms, distinct: the collection included a splendid bloom of Horace Vernet, which was selected as the best H.P. in the Local Classes, the premier T. being Maman Cochet, shown by Mr. T. A. GOVETT, who, with 6 good blooms of Snow Queen, was first of five competitors in Class 17. Mr. G. B. FORTESCUE had the best 12 Teas and Noisettes.

The 6 bunches of decorative Roses were not so good as we have seen at Windsor, but Mr. A. L. F. COOK was first with creditable examples, and he also won first prize for 9 blooms, distinct.

Mrs. ALEC. ROBINSON won first prizes for a very tasteful Dinner Table Decoration and for a basket of Roses.

The 6 bunches of hardy border flowers which won first prize for Mr. A. E. MOSENTHAL were excellent, as also were the 6 bunches of hardy flowering shrubs with which Mr. J. B. FORTESCUE excelled.

Sweet Peas.

These classes were not so well contested as in those for Roses, but Mr. J. WELLICOMBE, who won first prizes for 12 vases and 6 vases, had good blooms of Warrior, Constance Hinton and Mrs. A. Hitchcock. Mr. C. ROMAINE won the Mrs. Basil Fortescue Cup with 12 good bunches.

Fruit and Vegetables.

Two magnificent dishes of The Bedford and Laxton's Leader Strawberries were exhibited by J. B. FORTESCUE, Esq. (gr., Mr. W. Page), which would have been very difficult to beat.

Mrs. IRVING had an excellent collection of six kinds of vegetables, showing splendid Peas, Broad Beans and Cauliflowers.

Trade growers materially assisted in making a very successful show. Mr. ARTHUR TURNER brought large collections of hardy shrubs, Delphiniums, decorative Roses and excellent Malmaison Carnations. Messrs. FLORY AND BLACK had a 30-ft. run of first-class Orchids, which were sold to a local gentleman *en bloc* early in the day.

Mr. J. C. ALLGROVE brought magnificent Strawberries, a large collection of herbaceous plants and Roses. Mr. E. J. HICKS exhibited excellent Roses, Messrs. BIDE AND SONS showed splendid Sweet Peas, and Messrs. BRINKMAR BROS. arranged a miscellaneous collection of plants.

ST. DUNSTAN'S SHOW.

JULY 2 AND 3.—The exhibition held in the Chelsea Hospital grounds on these dates on behalf of the soldiers and sailors blinded in the war, was managed by the St. Dunstan's authorities. Although this was the third show at Chelsea within a very few weeks, it was a splendid one, as most people who could exhibit came out to assist the very laudable object for which this latest show was held. All kinds of horticultural subjects were displayed in excellent condition by both traders, amateurs and market men.

A vast array of prizes was provided by all sorts and conditions of people, so that practically every exhibitor obtained a cup or piece of plate or some other trophy whereby to keep this great show in memory.

Several exhibitors won numerous awards, and we believe Messrs. ALEX. DICKSON AND SONS, Messrs. R. FELTON AND SON, and SIR RANDOLF BAKER each obtained about eight cups or trophies.

The awards were made by a large number of judges who commenced duty at 9.15 a.m. The public was admitted at 10.30 a.m., but, as a consequence of rather wild and showery weather, there were comparatively few people present up to lunch time.

Pressure of show reports and limits of space prevent us from presenting a detailed report of a show which we sincerely hope was a great financial success.

Orchids.

The Orchids are practically in extent and quality as reported at the Chelsea Show last week and staged by the same exhibitors with the exception of one newcomer.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), had a grand group embracing most of the leading Orchids of the season, his Gatton Dendrobiums occupying the centre. A specially rare exhibit was Aërides odoratum album.

Messrs. ARMSTRONG AND BROWN, Tunbridge Wells, staged an extensive group, in which their fine hybrid Odontoglossums and Odontiodas, with handsome Cattleyas and Laelio-Cattleyas, were the features. White Cattleyas and Cypripedium niveum were effective in the front of the group.

Messrs. CHARLESWORTH AND CO., Haywards Heath, had a well-arranged group with hybrid Disas in the centre, fine specimens of Cattleya Warscewiczii and their handsome hybrid Miltonias, with Vanda coerulea and various Thunias on each side.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, arranged one of the largest and best groups, the scarlet Renanthera Imschootiana and bright Odontiodas showing up the rose and purple Laelio-Cattleyas very effectively.

Mr. HARRY DIXON, Spencer Park Nurseries, Wandsworth Common, completed the side with an excellent group of Odontoglossums, Odontiodas and Cattleyas, very fine specimens of the handsome Epidendrum prismatocarpum, Anguloa Ruckeri, Odontoglossum ramosissimum, Cochlioda Noezliana and Coelogyne pandurata being among the species shown.

Hardy Flowers.

Messrs. R. WALLACE AND CO., were awarded the first prize for a formal garden and won it with the design described in a previous Chelsea report, but on this occasion they had filled the borders in a delightful manner and the Honeysuckle behind the old stone seat was a touch of genius. The same firm contributed a display of Iris Kaempferi and Water Lilies. Messrs. BLACKMORE AND LONGDEN led for Delphiniums in a keen competition, and Messrs. W. ARTINDALE AND SONS were placed second; each staged round beds of capital varieties.

Messrs. W. ARTINDALE AND SONS occupied premier position for a border of herbaceous plants with a very effective exhibit, in which Eremuri played a prominent part. Mr. AMOS PERRY followed with a very fine exhibit.

Mr. MAURICE PRICHARD, Mr. G. W. MILLER, Mr. G. WHITELEGGE, Mr. G. W. REUTHE, Messrs. BAKERS, and Messrs. STARK were all exhibitors of hardy flowers in variety.

In the amateurs' classes for collections of hardy border flowers, LIONEL WARDE, Esq. (gr. Mr. A. Allum), Petersham House, Petersham, was very successful, winning several first prizes with good exhibits.

Plants.

Mr. AMOS PERRY presented a wonderful exhibit of hardy Ferns in great beauty and variety, a large collection of Delphiniums; a most interesting series of hybrid Liliums and a mass of Ostrowskya magnifica. What award he received did not transpire when we had to leave the show, but it could not fail to be an important one. MESSRS. JOHN WATERER, SONS AND CRISP and Mr. T. LEWIS both contributed large displays of Kalmias, and received important awards. The first-named firm contributed a bed of Rhododendrons with some capital standards of Retinospora filifera aurea. Stove plants were well displayed and in great variety by Mr. L. R. RUSSELL, and received an appropriate award. Messrs. J. CARTER AND CO. put up another large and superb exhibit at the end of the big tent, and here they arranged splendid Gloxinias, Begonias, Sweet Peas, Roses, Viscarias, Streptocarpuses and Pelargoniums in grand style, thus providing one of the principal features of the show, and we understand that it won the Blue Ribbon—i.e., the Prince of Wales's Cup—for the best exhibit in the show.

A wonderfully fine exhibit of Japanese Maples, showing a great variety of form and colour, was staged out of doors by Messrs. W. FROMOW AND SONS, and Messrs. JOHN WATERER, SONS AND CRISP had a very fine display of Maples in one of the large tents.

Messrs. BLACKMORE AND LANGDON filled a circular bed with their splendid Begonias, and they received their due reward.

Roses.

Roses were very finely shown, and in the class for a trade display of garden and exhibition varieties Messrs. ALEX. DICKSON AND SONS led with a beautiful group, in which Chrissie MacKellar, Harry Kirk and Mrs. F. Straker were outstanding varieties. Mr. ELISHA HICKS was placed second. The Messrs. DICKSON scored for twelve vases of Roses, and here they showed Golden Emblem, Rayon d'Or, Red Cross and Mrs. Wemyss Quin finely.

Mr. HICKS won the award for the best exhibit of a new Rose with Chas. E. Shea, Messrs. ALEX. DICKSON AND SONS coming second with F. Gaunt. The latter firm was first for garden Roses and for a basket of Roses, showing Lady Hillingdon in the latter case. For garden Roses, amateurs, the MARQUIS OF RIPON (gr., Mr. T. Smith), Coombe Court, Kingston, was premier prize winner.

In the large tent Mr. ELISHA HICKS put up a very large and imposing exhibit of Roses, but had so many pillars of bloom that the display was rather formal. He received first prize for this trade group.

Sweet Peas and Carnations.

Sweet Peas were a great feature, and numerous classes were provided. The show was fortunate in finding Sweet Peas at their best, and at a time when the National Sweet Pea Society had just held its annual show at Westminster. The flowers lend themselves admirably for exhibition purposes, and they are always objects of great interest to visitors.

Messrs. Alex. Dickson and Sons won two first prizes and the special *Daily Mail* prize with splendid exhibits. Messrs. E. W. King and Co. and Mr. J. Stevenson were also prize winners, and Messrs. E. Webb and Sons erected a temple of Sweet Peas in the Orchid Tent. In the amateurs classes Sir Randolf Baker (gr. Mr. Usher), Blandford, gained several premier awards, and his vase of Mrs. Tom Jones was the best in a special class for new varieties. This grand sort is a pleasing shade of blue, and is certain of a leading place amongst the choicest varieties both for garden decoration and exhibition purposes. Mr. H. S. Button, Northwood, was another successful competitor.

Mr. Jas. Douglas won the chief award for a dozen vases of border Carnations with a splendid exhibit, with Mr. Lakeman second. For perpetual Carnations Messrs. S. Low and Co. led for British varieties and also for the dozen vases of blooms. Mr. Engelmann was also a prize winner and so were Messrs. W. Cutbush and Sons, while Messrs. B. Ladhams made a fine display of garden Pinks.

Sir Randolf Baker secured a premier award for six vases of perpetual Carnations. He showed beautiful flowers of Scarlet Carola, Carola and White Perfection.

Floral Art.

Floral designs from several firms provided a distinct attraction. Messrs. Felton and Sons did well and won prizes for a basket of Carnations, for a group of floral designs, for button-hole bouquets, for a vase of Orchids, and for a bouquet (composed of White Orchids). Messrs. Pipers, Mr. E. Young, Messrs. Taviners, Messrs. Anthos and Co., and Mrs. A. F. Barton were also successful competitors in the classes for floral designs.

Fruits and Vegetables.

The Marquis of Salisbury (gr. Mr. Prime), Hatfield House, Hatfield, gained a trophy as first prize for a collection of hardy fruits, with an extraordinarily fine exhibit in which the new Strawberries Hatfield Victor and St. Dunstan's were of immense size, and everyone agreed they had never seen such wonderful fruits, but it must be admitted they were ugly in shape; Cherries, Currants and Gooseberries were included in the display. Messrs. E. Webb and Sons put up a grand exhibit of their specialities in vegetables, and the whole display was an example of good arrangement and high attraction. Messrs. Jas. Carter and Co. were placed first for a trade display of vegetables, and they staged grand Peas, Marrows, Cauliflowers, Carrots and Lettuces. The same firm secured first prize for a collection of culinary Peas. Messrs. Felton and Son had the best trade exhibit of fruits, and won a valuable prize with choice fruits, finely arranged.

The Chamber of Horticulture filled half of one tent with contributions from their members. These included fruits and vegetables in market packages from Messrs. Monro, Ltd.; Bananas from Messrs. Elders and Fyffes; Tomatos in pots from Messrs. Thos. Rochford and Son; vegetables from Messrs. J. Carter and Co.; hardy plants from Mr. Hemsley; pot plants from Mr. J. Collingridge and Mr. Philip Ladds.

Outdoor Exhibits.

The outdoor exhibits remained very much the same as at the two previous Chelsea shows; the chief exhibitors were Messrs. Pipers, Mrs. Herbert Jones, Messrs. R. Wallace and Co., Mr. J. Wood, Mr. L. R. Russell, Messrs. Pulham and Son, Messrs. R. Tucker and Sons, Mr. Clarence Elliott, the Misses Hopkins, and Mr. S. Whitelegge, who contributed either alpine gardens, formal gardens, or trees and shrubs. Rain was falling at the time our reporter left the show, and visitors were unable to inspect these fine exhibits out-of-doors, except at much discomfort.

NATIONAL ROSE.

July 2.—The annual show at Regent's Park, London, was well attended, in spite of the heavy showers which fell throughout the afternoon. The show was better than the Society's most sanguine supporter could have expected, and the general quality of the blooms was high. Probably never before have such fine baskets of cut Roses been shown as on this occasion, nor have there been so many beautiful blooms used in the dinner table and vase classes, which filled a large tent.

New Seedling Roses were equal in quality, though not in numbers, to those of any previous show, and to these 2 gold medals and 6 cards of commendation were awarded. In respect to the awards we congratulate the council on the wise restraint they exercised in bestowing gold medals; no doubt they feel with us that it is better to pass over, for the time, any new Rose which is not of undoubted excellence, as it can be shown again at some future time and its merits reconsidered. We are inclined to the opinion that it would be a salutary rule that no variety should be allowed to receive the high award of a gold medal when first shown. Large groups of Roses which were formerly such a great feature at Regent's Park were impossible this year, but we fully anticipate seeing them again at future shows.

The Edward Mawley Memorial Medal for the most meritorious exhibit in the nurserymen's section was awarded to Messrs. Prior and Sons for their splendid baskets of Roses, while Mr. R. L. Wettern received a similar award in the amateurs classes for his collection of 12 varieties of decorative Roses in class 49.

New Roses

Gold Medal Awards.

Mrs. C. V. Howarth. — A strong growing variety. Its blooms have broad petals, and they are long in the bud. The colour is difficult to describe, being an exquisite combination of yellow, orange and pink, but the general effect is pink-flushed, orange-salmon. The flowers are very well formed, and the neat foliage is shining and deep green. A very decorative Rose. Shown and raised by Messrs. Alex. Dickson and Sons.

Miriam.—A large new H.T. Rose, said to be suitable for garden and bedding purposes. The flowers are large and full, and half-opened buds are very shapely. In the young state the flowers are deep salmon pink, with a yellow glow, but older blooms develop a deep shell-pink colour. Slightly fragrant. Shown by Rev. J. H. Pemberton.

Certificate of Merit.

Independence Day.—A gorgeous new H.T. Rose of medium size and capital shape in the bud. It has very broad petals, but does not make a very full flower. The colour is deep orange yellow with pink flushing on the outer petals of the fully-opened blooms. The foliage is bright and shining. Shown by Messrs. Bees, Ltd.

Prince of Wales.—This is a dwarf Hybrid Tea Rose, said to be suitable either for exhibition or bedding purposes. The blooms are of medium size, broad-petalled and very sweetly scented. The colour is bright, clear, rosy scarlet, but the outer petals fade to rich rose, and often have a magenta tint. Shown by Mr. Walter Easlea.

Countess of Warwick.—A very pretty Hybrid Tea Rose with very shapely and good sized, bright cream-yellow flowers. The flower has a particular charm by reason of a little pink colouring at the tips of the buds, this colour also showing along the upper margins of the inner petals of some of the blooms.—Shown by Mr. Walter Easlea.

Tim Page.— A bold Pernetiana variety, of strong growth, with bright, clean, shining foliage and an abundance of formidable spines. The colour is bright, clear canary yellow. The blooms are of rounded shape and not very full. Raised by Mr. Courtney Page, and shown by Mr. Walter Easlea.

Hawlmark Scarlet.—A very brilliant velvety, crimson-scarlet, H.T. variety. The shapely flowers are scented, and very attractive in appearance. Shown by Messrs. Alex Dickson and Sons.

Amongst a number of other good varieties submitted for Award, staged in the tent devoted entirely to seedling varieties, we made special note of Evelyn Thornton, a dwarf, free-flowering Polyantha variety, of moderate and bushy growth and perpetual habit. The blooms are soft pink, with bright golden stamens and a golden glow at the bases of the petals. Shown and raised by Messrs. Bees, Ltd., Liverpool.

Amateurs' Classes.

In several respects these were the best classes in the show. The leading exhibitors had particularly good blooms well arranged, and in most classes the competition was very good indeed.

The Championship Trophy for 36 blooms, distinct, was won by Dr. Lamplough with splendid collections of such varieties as George Dickson, Florence Forrester, H. V. Machin, A. Hartmann, Gloire de Chédane-Guinoisseau, and Mrs. T. Roosevelt; 2nd, Mr. F. Dennison, Leamington, whose best sorts were George Dickson, H. V. Machin and Mrs. G. Shawyer; 3rd, Mr. H. L. Wettern.

The best 24 blooms were by Mr. John Hart, Little Heath: Lady A. Stanley, Mrs. Norwood, George Dickson and Gladys Harkness were very good indeed. 2nd, Mr. F. Dennison, in whose stand were four blooms of Lyon Rose, Lady Ashtown and Mrs. George Marriott. 3rd, Mr. C. C. Williamson. In the class for 12 blooms, open to growers of fewer than 1,000 plants, Mr. R. de V. Pryor, Hitchin, won first place, showing H. V. Machin, George Dickson and Candeur Lyonnaise particularly good. 2nd, Rev. F. R. Burnside, Great Stanbridge. In the similar class for growers of fewer than 500 plants the first prize and Ben Cant Memorial Trophy was awarded to Mr. S. W. Burgess, Tonbridge, and his very best blooms were of Coronation, Geo. Dickson, Leslie Holland and Snow Queen. 2nd, Mr. F. Chilton, Bexhill-on-Sea, who showed a deeply coloured flower of Cissie Easlea.

The best nine blooms were by the Rev. R. F. Cobbold, Bratton Fleming, while Dr. Lamplough won the Elisha J. Hicks Challenge Cup with 24 excellent blooms, of which the very best were Mildred Grant, H. V. Machin and Mrs. Geo. Norwood; 3rd, Mr. G. C. Sawday. Mr. W. Sunderland, Driffield, was the winner with 12 blooms, and he had beautiful examples with White Maman Cochet and Lyon Rose; 2nd, Mr. E. Jackson, Rochford.

The Hammond Prize was won by Mr. W. E. Moore, Reading, with nine praiseworthy blooms, including Avoca and Lady Alice Stanley, these sorts being especially good.

In the classes for smaller growers first prizes were won by Mr. L. Thomson, Mr. R. C. Turnbull, Mr. R. de Escofet, Mr. S. W. Burgess, and Mr. C. Wilkinson: the latter showed a very fine basket of exhibition Roses.

Dr. Lamplough took first place in the T. and N. Classes having, 12 very good blooms. The Rev. F. R. Burnside, Mr. J. Hart, and Mr. Moore were also successful in these classes. Mr. H. R. Darlington was first with three excellent baskets, and Mrs. C. Page was successful in the class for two baskets.

The Dixon Davis Cup was won by D. H. Davies, Esq., Beaconsfield, with a very novel arrangement. The *motif* was a foreshortened model garden, having a tall pergola enclosing a glass pool with central leaden figure, and the whole enclosed by Box hedges. A profusion of cut Roses made it very bright and attractive. 2nd, Dr. Lacroze, Roehampton, who had a conventional arrangement of excellent decorative Roses.

H. R. Darlington, Esq., Potters Bar, was the best exhibitor of a representative group of cut Roses on staging 5 ft. by 3 ft., and he received the first prize for a very fresh and good collection. 2nd Mrs. Chaffey Giddins, South Mimms. Four exhibitors competed for the Orpen Challenge Cup, which was won by Mr. G. C. Sawday, Wey-

bridge, with a very attractive display. 2nd, W. FARR, Esq., Swindon, Wilts., a formal arrangement of very good blooms.

With a magnificent collection H. L. WETTERN, Esq., Oxted, won the first prize for 12 decorative varieties. He had splendid vases of Paul's Scarlet Climber, Lady Pirrie, Lady Hillingdon, Pink Pearl, and American Pillar; 2nd, Mrs. BEVIL FORTESCUE, Maidenhead, who showed a meritorious collection.

Groups of Roses.

The old-time magnificent groups of Roses arranged on the ground did not find a place this year at Regent's Park, the difficulties that beset the trade were unsurmountable, and there were only two representative groups of cut Roses on a raised space not exceeding 30 feet by 4 feet. Messrs. B. R. CANT AND SONS easily won the first prize with a splendid collection of very fresh, clear blooms. The tall stands at the back included beautiful arrangements of Rosa Moschata alba, Climbing Irish Fireflame, Cupid and Emily Gray. Smaller but still large stands contained Red Letter Day, La Tosca, Covent Garden, Juliet, Rayon d'Or, Mme. Ed. Herriot, and richly coloured Christine. 2nd, REV. J. H. PEMBERTON, whose chief varieties were Prosperity, Pax, Vanity, Trier and Miriam.

The only group on the 10 feet by 4 feet raised space was by Messrs. JARMAN AND CO., who received the first prize for a slightly weather-stained but still praiseworthy collection of such varieties as E. V. Herminos, Cupid, Diabolo and Goldfinch in large stands and Mrs. T. Roosevelt, H. Munich, H. V. Machin and Marquise de Ganay on exhibition boards.

The A.C. Turner Cup, offered for 36 distinct varieties in from 3 to 12 stems of each and arranged on a space not exceeding 14 ft. by 3 ft. The first prize was awarded to Mr. JOHN MATTOCK, who had Ecarlate, Rosa Mundi, Lady Pirrie, Cheerful, Crimson Damask, and Lady Curzon; 2nd, Messrs. FRANK CANT AND CO., who had an especially good stand of fresh, even bunches, which included particularly good examples of Rayon d'Or, Mme. Pernet Ducher, Mme. Ed. Herriot, Cherry Page, Mrs. E. G. Hill and Edu. Meyer.

In the class for 12 varieties of Decorative Roses, the first prize was won by Messrs. F. SPOONER AND SONS, who had a tasteful arrangement of excellent Roses in such sorts as Rayon d'Or, Mrs. Alfred Tate, Messrs. Wemyss Quin, 2nd, Mr. GEORGE LILLEY, whose best flowers were Hadley and Lady Pirrie. The 12 vases of Polyantha Roses were very attractive, and many good varieties were represented. The first collection was by Mr. JOHN MATTOCK, who included Orleans Rose, Etoile de Mai, Leon Lamesch; 2nd, Messrs. F. SPOONER AND SONS.

Baskets of Roses.

The baskets of cut Roses were the best exhibit of decorative Roses in the show. Messrs. CHAPLIN BROS., LTD., won the first prize with seven magnificent baskets of Edith Cavell, Wemyss Quin, Red Letter Day, Mme. Ed. Herriot, Margaret Dickson Hamill, Mrs. Dunlop Best and Lady Pirrie. 2nd, Messrs. A. DICKSON AND SONS, who showed splendid baskets of K. of K., Christie Mackellar, Lady Hillingdon and Lady Pirrie.

Mr. JOHN MATTOCK was first with three baskets, and he had beautiful blooms of General McArthur, Climbing Melaine Soupert and Irish Elegance. 2nd, Mr. HY. DREW.

Table Decorations.

As we have already recorded, these were one of the chief features of the show, and we have never before seen such attractive arrangements. Many varieties were used, though Ophelia, Irish Elegance and Melody were the favourites. Mr. G. HICKS won the first prize in the open dinner-table class, where Mr. GEO. LILLEY was a good second. In the Ladies' Classes, Miss COURTNEY PAGE, mixing Old Gold with Irish Fireflame, was placed first, with Miss E. GRIFFITH, who employed Irish Elegance, second. Miss HALE, in the class restricted to single Roses, was first, with ISOBEL and Mrs. PAGE second.

Using Ophelia to great advantage, Mrs. C. PAGE won first prize in the next class, and Mrs. A. ROBINSON was second. Mrs. O. FISHER, Sudbury, Harrow, excelled in the class for a bowl of Roses, and Mrs. PAGE was successful in the second class, while Mrs. HALE was awarded first for a charming combination of Mme. Ed. Herriot and Mme. Melaine Soupert.

Exhibition Roses.

It was not to be expected that the blooms in these classes would be of pre-war standard, but they were highly creditable, and in most classes the competition was good. Teas and Noisettes showed some signs of the inclement weather, but generally the H.P.'s and H.T.'s were surprisingly clean and fresh and of good typical colour. The premier class, requiring 72 distinct varieties, which is very trying at the best of times, was well represented.

The Championship Trophy was won by Messrs. D. PRIOR AND SONS, with a relatively even and good collection. The very best blooms were Maman Cochet, George Dickson, Avoca, White Maman Cochet, J. L. Mock, Lohengrin, Lady Barham, Candeur Lyonnaise, and Melanie Soupert. 2nd, Messrs. ALEX. DICKSON AND SONS, who had very good blooms of Hawlmark Yellow, Margaret Dickson Hamill, Lady Greenall, George Dickson. 3rd, Messrs. B. R. CANT AND SONS.

The blooms were not quite so good in the smaller class for 48 blooms. The trophy was won by Mr. G. LONGLEY, in whose stands we selected the following as being the very best: Avoca, Mme. de Watteville, Duchess of Normandy, George Dickson, W. C. Grant, J. B. Clark, Mrs. W. J. Grant, Hugh Dickson. 2nd, Messrs. A. DICKSON AND SONS, who were strong in yellow, including Clara Curtis and Molly Bligh, with Capt. Kilbee Stuart, H. V. Machin, George Dickson and Lyon Rose. The 24 bloom class was particularly strong, and the first prize was awarded to Messrs. JARMAN AND CO. for a fine collection including H. V. Machin, A. Hartmann, Juliet, Mildred Grant and Snow Queen in tip-top condition. 2nd, Messrs. CHAPLIN BROS., whose best were Mrs. J. Laing, Lady Greenall and Edith Cavell. 3rd, Mr. HY. DREW. The D'Ombrain Cup, for 18 Teas and Noisette blooms, was won by Mr. GEO. PRINCE. The best of his collection were Mrs. Campbell Hall, W. H. Smith, Maman Cochet and Lady Plymouth. 2nd, Mr. HY. DREW, who had really fine blooms of white Maman Cochet, Mrs. Foley Hobbs and Mrs. E. Mawley. 3rd, Messrs. D. PRIOR AND SONS. The Kilbee Stuart Cup was well won by Mr. ELISHA HICKS with 12 splendid new Roses, of which the following were particularly worthy: Mme. C. Martel, Col. Oswald Fitzgerald, Gorgeous, Gladys Holland, Mme. L. Crette and Mrs. B. Walker. 2nd, Messrs. A. DICKSON AND SON, who included Edward Bohane, Mrs. Willmott and Col. Oswald Fitzgerald. 3rd, Messrs. B. R. CANT AND CO.

With magnificent blooms of White Maman Cochet, Messrs. D. PRIOR AND SONS showed the best basket of one variety. 2nd, Messrs. A. DICKSON AND SONS with brilliant blooms of Col. Oswald Fitzgerald.

DEBATING SOCIETIES.

Southampton and District Gardeners'.—At a meeting of the above Society, held on Thursday, the 19th ult., an interesting lecture on "Summer-Sown Vegetables" was delivered by Mr. W. F. Giles, of Messrs. Sutton and Sons. The lecturer stated that the welcome break in the recent long drought has been most opportune, for the supply of vegetables would otherwise have been greatly curtailed were it not possible to augment the supply by crops raised from seeds sown during the coming month. The members were so impressed by the lecture that they decided to institute this year a competition for the best three dishes of vegetables grown from seed sown after July 5th. Mr. Arthur W. Sutton's lecture dealing with the same subject before the members of the Royal Horticultural Society in October last, has been reprinted in pamphlet form by permission of the Council of the R.H.S., and copies of the pamphlet may be obtained from Messrs. Sutton and Sons, Reading.

MARKETS.

COVENT GARDEN, July 2.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Plants in Pots, &c.: Average Wholesale Prices.

REMARKS.—The bedding season is now over, and more attention is now being paid to Ferns, Palms and other foliage plants. The most attractive flowering plants are Hydrangeas, mostly pink and white Marguerites, Crassulas, a few Rambler Roses, and also a few pots of Viscarias, which are very fine, both in sixty and forty-eight sized pots.

REMARKS.—The market continues to be well supplied with coloured flowers, but white material is again scarcer, Achillea The Pearl being the newest arrival. Double white Stock is a very limited supply at the present time, owing to the cold weather, and white Pinks are almost finished. White Asters are wanted, and the first arrivals will be greatly welcomed. Lily of the Valley is not on the market, nor are there many Arums, but Lilium longiflorum is again back to 15s. to 18s. per bunch. Cornflower, Gypsophila, Carna-

tions and Sweet Peas appeared to be a shorter supply this morning. Other hardy flowers in the market include Coreopsis, Delphiniums, Gaillardias, White Daisies, mauve Scabiosa caucasica, Sweet Sultans, Saponaria, Canterbury Bells, and Alstroemeria.

Remarks.—Strawberries are a shorter supply, "Southamptons" being practically finished. Raspberries are now available. English and Guernsey Grapes are increasing in supply. Melons are fewer, with a slight increase in price. A shipment of Pines is due shortly to arrive. English outdoor fruits are available in fair quantities. Cherries are temporarily in shorter supply, but the consignments of Black Currants and Red Currants are increasing daily. Green Gooseberries are nearly over, most samples now showing signs of colour in the berries. There are fewer Tomatos and Cucumbers at slightly firmer prices. Beans and Peas are also more expensive, due to limited quantities. Asparagus is almost finished, and the growers are cutting to execute special orders only.

GARDENING APPOINTMENTS.

Mr. A. C. Wicks, for the past 7½ years gardener to J. K. Foster, Esq., Coombe Park, Whitchurch, Oxfordshire, as gardener to Howard Gould, Esq., Mongewell Park, Wallingford.

Mr. E. Davies, for the past four years gardener at Hoole House, Chester, as gardener to Mrs. Wardell Yerburgh, Hoole Hall, near Chester.

Mr. W. Blavington, as gardener to Mrs. M. M. Butler, at Heywood, Cobham, Surrey.

SCHEDULES RECEIVED.

Sunbury, Wembley and Alperton Horticultural Society.—Twenty-sixth annual show to be held on Saturday, July 26th, 1919, in the grounds of Sudbury Park, Wembley (lent by G. T. Barham, Esq.).

Borough of West Ham and Districts Horticultural and Chrysanthemum Society. — Second annual Summer show to be held on July 19th, 1919, at the Town Hall, Stratford, and the twenty-eighth annual Autumn exhibition to be held on November 6th, 7th and 8th, 1919, at the Town Hall, Stratford; monthly exhibitions and lectures held in the Norwich Hall, Norwich Road, Forest Gate.

CATALOGUES RECEIVED.

R. C. Notcutt, Woodbridge—Earlham Montbretias (hybrid).

The Premier Seed Co., Ltd., 117, London Rd., Brighton.—Seeds for summer and autumn sowing.

CROPS AND STOCK ON THE HOME FARM.

Potatos.

Potatos present a patchy appearance in many places, but where the land was deeply cultivated and manured in the autumn the tubers were early planted, and the haulm is robust and very promising in spite of the long continued drought in the southern counties. Where the conditions were not so favourable there is not the same promising outlook, particularly with late planted tubers. Never has the difference between new and old seed been so noticeable as during the present season's growth. From old seed the foliage is developing weakly and irregularly, with leaves exceptionally pale in colour.

The earthing up of the rows should be done as fast as the haulm requires it. If the soil between the rows is previously deeply moved with the Planet horse hoe the earthing up with the double plough will be expedited. Where a Potato digger is to be used for lifting up the crop, it is a good plan to earth up the haulm twice, as the wheels of the digger are then lower in the soil, and the shares of the digger are quite underneath the tubers, thus throwing them out cleanly, otherwise many tubers will be cut with the shares and others left in the soil. Where early varieties such as Eclipse, Sharpe's Express, and Epicure made a good start they have done well this season, and although the tubers are small, owing to drought, the price has been good, as much as £45 per ton having been made.

Cabbage.

In the southern counties the dry weather deferred the planting of Cabbages. Further delay was caused by the slow growth of the plants, due to persistent attacks of Turnip fly and the dry weather. A continuance of dry weather is better for plants in stiff soil, if it is possible to water the soil when each plant is put in; the plants start away sturdily and there is not the same risk of slugs eating them. If the soil between the rows is stirred within a couple of weeks after planting growth will be assisted.

Mangolds.

Where there is a good plant the growth is satisfactory, especially where the soil is kept clear of weeds. Directly the plants are thinned or "set out" ½ cwt. of sulphate of ammonia should be evenly sown over each acre, and the application repeated within a month. Mangolds revel in sunshine when all other conditions are favourable. These roots will be very much in demand during the coming winter, as hay is such a thin crop. I hear of some fields being again sown only last week, but even so, the roots will be small, but valuable.

Mares and Foals.

The spell of dry weather was all in favour of foals, of which there is a goodly number this year. Owing to such weather as we have experienced the grass is, in upland pastures, almost approaching hay, which is good for the mares and naturally aids the growth of the foal through the quality of the milk. A few handfuls of Oats given to the mare morning and night is a distinct advantage, further enriching the milk. In our own case the foals grow freely as compared to those that do not have the added Oat food. Where foals are grown for sale and not for home use the aim should be to get them as large and sturdy as possible by weaning time—October — at which period the foal sales are usually held. A plentiful supply of water should always be provided for the mares, and where shade is obtainable under trees during hot weather it is a means of shielding the animals from the persistent attack of flies.

Artificial Manures for Future Corn Crops.

Where much summer fallowing of land is in hand (and I find this method of management is largely on the increase, as compared with the trouble of growing root crops to be fed off by sheep and cattle) preparation for a supply of fertilisers should be made at once to prevent disappointment when the sowing of them for the various crops should take place. For Wheat, to be sown on a summer fallow in October, no fertiliser is equal to farmyard manure spread on the land and ploughed in at once at the rate of 20 tons per acre, but where the acreage is extensive sufficient dung cannot be obtained from the farm. For Wheat, especially on stiff soil, basic slag is valuable if distributed evenly over the land at sowing time at the rate of 6 cwt. per acre; 1 cwt. of sulphate of ammonia should be added, and a similar quantity given during December if the weather is favourable—i.e., not frosty.

For Barley and Oats superphosphate of lime, 4 cwt. per acre, is advisable, and for the latter crop 1 cwt. per acre of sulphate of ammonia in April will improve growth considerably. For grass, too, basic slag and sulphate of ammonia are valuable, and should be obtained where animal manure is scarce. It is useless to expect full crops of either Corn, grass or roots without sufficient aid is given to induce freedom of growth. Some people cut Hay from certain fields year after year without applying manure of any kind, and they wonder why the crop is so light—probably less than half a ton per acre. *E. Molyneux.*

Condition of the Crops.

The monthly report of the Crop Reporters of the Board of Agriculture states that the dry weather was generally favourable for farming operations and enabled arrears of work to be greatly reduced. Rain, however, is now badly needed for the corn crops, fruit, and grass.

Wheat generally looks well, particularly the autumn sown, but spring sown and that on ploughed grass land is not so satisfactory, considerable damage having been done by wireworm. Oats have also suffered from the same cause, and re-sowing has in some districts been necessary. The late-sown Oats have also been adversely affected by the drought. Barley, though backward, generally looks well, especially the early sown, and all corn crops would be much benefited by rain. Beans and Peas are promising, though the former are short in the haulm. The area under Barley is rather greater than last year, but that under Oats slightly less.

Potatos are backward, and there is still some planting to be done, and much of the main crop is not yet showing above the ground. The early varieties look healthy and promising, but need rain. The area under Potatos is estimated to be about 15 per cent. less than last year.

The sowing of Mangolds was backward, but is now nearly completed. The earlier sown seed germinated well, but now requires rain, and fly is reported to be troublesome. Turnip sowing is now in progress, but is very backward, and in many districts rain is needed for the preparation of the seed bed.

The weather has been very favourable for Hops in Kent, and the plants are healthy and have made excellent growth. Aphis has made its appearance in many instances. The area under Hops has increased by about 5 per cent. since last year.

The prospects for all classes of fruit are good, though insect pests are proving troublesome, and rain would be welcome. Both orchard fruit and small fruit promise to exceed the average.

The area intended for Hay, whether from seeds or meadow, is slightly less than last year, about 2 per cent. It would have much benefited with rain, and the yield is expected to be for both kinds about 10 per cent below the average.

Harvest Beer

The Ministry of Food have agreed with the Board of Agriculture to release a certain amount of malt for the home brewing of harvest beer. The Agricultural Executive Committees for those counties in which home brewing is an established custom will be authorised to issue permits to farmers for an amount not exceeding two bushels of malt for each labourer employed.

Obituary.

C. Lemesle Adams.—We much regret to learn of the death, on Thursday, June 26, of Mr. C. Lemesle Adams, of Pendeford Hall, near Wolverhampton. Mr. Adams was a keen amateur horticulturist, but he paid special attention to the cultivation and raising of Daffodils, and was particularly successful with these flowers in his charming garden at Pendeford, where, in a wide "ditch," he cultivated them in a most delightful manner. For many years he was a member of the Royal Horticultural Society's Narcissus Committee, and he also took a very prominent part in the work of the Midland Daffodil Society, of which body he was treasurer. He was an excellent judge of Daffodils. He had a charming personality, consequently his loss will be mourned by a very wide circle of acquaintances to whom his death, following a long period of indifferent health, has come as a great sorrow. The funeral took place on Tuesday, July 1, amid many expressions of love and esteem. The floral tributes included a large wreath sent by his fellow members of the Royal Horticultural Society's Narcissus Committee.

TRADE NOTES.

American Restrictions on Import of Horticultural Produce.

We learn from "The National Nurseryman" (America) that the directors of the American Paeony Society had their annual meeting in New York in March, 1919, and adopted a protest against Quarantine No. 37, which very pertinently points out the unjust and autocratic features of the quarantine, also that it is unscientific and ill-considered.

The directors of the American Paeony Society also presented the following recommendations to the Secretary of Agriculture, to the Horticultural Board, and to the Members of the Senate and House of Representatives:

"That the quarantine regulation No. 37 should be at once suspended.

"That a new quarantine measure should be framed with the co-operation of the nursery and greenhouse interests, which should contain only such provisions of exclusion as are demonstrably and convincingly necessary and such as would be really effective.

"That where important classes of foreign plants are to be excluded, several years' notice of such exclusion should be given in order that the cultivation of stock in this country may have reached a fairly adequate development before the foreign sources of supply are cut off."

LAW NOTE.

At the London Bankruptcy Court on Friday, before Mr. Registrar Francke, an application was made for the discharge of Robert Green, of 146, Portsdown Road, W., lately residing and carrying on business in partnership at Southfield Paddock, Ealing, and the Nurseries, Hounslow, also carrying on business at the Bedford Conservatories, Covent Garden, W.C., now residing at 66, Victoria Road, Kilburn.

The Official Receiver reported that the Receiving Order was made on March 14, 1914, on the debtor's own petition. The liabilities to rank for dividend were estimated at £5,092 13s. No assets were disclosed, and none had been realised. The debtor was formerly employed in the business of nurseryman by his father, and after the latter's death he was for a short time employed by his mother. In May, 1891, his mother handed over the business to himself and his two brothers, and they continued it in partnership under the original name of Robert Green, at 28 and 29, Crawford Street, W., and at Hounslow. In September, 1890, he took over the business of a nurseryman and dealer in birds, animals, etc., which had been left to him by his grandfather, and which was carried on at Covent Garden Market, under the style of The Bedford Conservatories. In 1896, he and his brothers also commenced business as job masters at Thornton Place, W., and Southfield Paddock, South Ealing. In 1898, the business was converted into a company, under the name of Green and Co., Ltd., of which he became joint managing director. The company, however, was wound up in January, 1901. In 1898 the first-mentioned business was taken over by another private company, the bankrupt and his brothers receiving as vendors £3,000 in fully-paid shares. Those shares were handed over to a creditor as security for his debt, and the company also arranged to discharge practically all the debts. The company paid off about £7,000 of those liabilities. He was a director of the company until the date of the Receiving Order. The Conservatories business in Covent Garden was carried on by him in partnership with other persons until December, 1903, when his partners bought him out and took an absolute assignment of the business from that date. They also paid all the liabilities in connection with that business. The bankrupt attributed his failure to his liabilities for the old debts in connection with the nurserymen's business which were in course of settlement by the company, to pressure by creditors, to the failure of Green and Co., Ltd., and to liabilities he had incurred in regard to a business carried on by his wife, also to his expenditure having exceeded his income.

Eventually the registrar suspended the discharge for the nominal period of three months.

Answers to Correspondents

Asparagus Bed: *F. P. H.* A small dressing of sulphate of ammonia would be beneficial, but do not use more than 1-2 oz. to the square yard. Superphosphate may be applied to the bed in the autumn, and a more liberal quantity may be used, as this fertiliser is very slow acting. If you cannot obtain manure in the autumn, top-dress the bed with rich soil mixed with leaf-mould and wood ash.

Gardener's Notice: *F. W. F.* It is customary for a head gardener to give and receive a month's notice, but there has been no decision of the High Court of Justice, and the decision of a County Court judge is not binding on other judges. (See article entitled "A Gardener's Notice," in the issue for March 22, p. 143.) With regard to the cottage, you would probably not be regarded as a tenant in the ordinary sense, as it is part of your remuneration for services.

Gardeners' Royal Benevolent Institution: *W. L.* Write to the Secretary, Mr. George Ingram, 92, Victoria Street, Westminster, S.W.1.

Melon Leaves with "Blight": *G. B. D.* The dried leaf was insufficient for a correct determination of the complaint, but we suspect the trouble is due to Spot disease, caused by the fungus Cercospora melonis. Spray the plants with liver of sulphur at the strength of 2 ozs. in one gallon of water. Do not allow any of the specific to wet the painted wood work, as it will cause the white paint to turn black. On future occasions, when sending specimens for examination, pack them in a tin box with damp moss.

Mossy Lawn: *W. W.* The "moss" you send is Sagina procumbens, a common weed in dry, sandy places. Its presence on lawns indicates an impoverished soil and one that is dried out in spring and summer. Remove as much of the weed as possible by means of an iron rake and afterwards dress the turf with some nitrogenous fertiliser such as sulphate of ammonia or nitrate of soda, either of which will cause the grass to grow more freely and, in time, crowd out the weeds. In the autumn enrich the grass with a top-dressing of old potting compost or some of the top soil from the kitchen garden, and at the same time apply a liberal dressing of well rotted farmyard or stable dung. In the early spring these materials should be raked both ways to disintegrate them and collect the rubbish for burning.

Names of Plants: *T. E. C.* 1, Elaeagnus glabra var. variegata; 2, Escallonia punctata; 3, E. macrophylla; 4, Viburnum plicatum; 5, Rhododendron Wilsonii; 6, Incarvillea Delavayi.—*W. R. P.*: 1, Cercidiphyllum japonicum; 2, Cedrela sinensis; 3, Pyracantha coccinea var.—*G. E.*: Philadelphus Lemoinei.—*R. K.*: 1, Gaultheria Shallon; 2, Senecio laxifolius.—*W. R. P.*: Campanula Raddeana.—*T. H.*: 1, Geranium ibericum; 2, Erodium petraeum; 3, Geranium sanguineum; 4, G. Endressii.—*A. N.*: 1, Verbascum nigrum var. densiflorum; 2, Thalictrum glaucum; 3, Phytolacca acinosa; 4, Staphylea colchica; 5, Orchis foliosa; 6, Genista tinctoria; 7, Elaeagnus hortensis; 8, Zanthoxylum alatum.—*G. E.*: Lepidium Smithii.—*Miss P.*: Calycanthus floridus.—*L. T. J.*: Polygonum Baldschuanicum Centranthus ruber: Red Valerian

Peach Leaves Falling: *A. C. M.* The scorching and falling of the Peach leaves may have been brought about by allowing the borders to become dry. If the roots are growing in a much drier medium than is desirable, water the border thoroughly, and if the border is partly outside, see that this also is given a good soaking. The atmosphere of the house should be kept damp by syringing and air should be freely admitted during warm weather. Place a thin shading of limewash over the glass, and when the trees are growing satisfactorily, remove it. Peach leaves are easily damaged by spraying mixtures containing copper; the scorching could not have been caused by the spraying mixture or the fumigating compound named unless they have been improperly employed. Neither do we think that the "fumes" from the paint are responsible for the damage to the foliage.

Peaches With White Spots: *R. T. W.* The white spots on your Peach fruits are patches of Peach mildew. Dust the leaves with flowers of sulphur whilst they are damp. In cases of very bad attacks the water-pipes should be made very hot and then painted with sulphur. This is best done just before it is dusk, in order that the house may be closed for an hour or two whilst the sulphur fumes are being given off. See that the roots of the trees are not growing in a dry medium, for drought is one of the principal predisposing causes of mildew.

Rust on Grapes: *W. J. K.* The markings on the Grapes are probably due to injury whilst the berries were young, either by allowing cold draughts to enter the house or by overheating of the water pipes. Similar markings may also be caused by the berries coming in contact with the hands of the workmen during thinning operations. The ventilators should be opened on the opposite side from which the wind is blowing; if the house is a lean-to, cover the ventilators with gauze to moderate the inrush of air.

Stoppage of Payment: *J. R. W.* Unless we know all the circumstances we cannot say whether your employer was justified in deducting payment for the time you absented yourself from employment. It is the practice for gardeners to receive payment during times of illness and other exceptional circumstances, over which they have no control.

Thompson's Gardeners' Assistant: *G. M. F.* The book to which you refer is a useful and practical work dealing with the whole range of gardening.

PRIVATE.

BRITISH GARDENERS' ASSOCIATION. (Reg. No. 1666 T.).

THE Standard of Wages and Hours adopted in January last is now withdrawn and a new Standard is under the consideration of the Executive Council. When this is published, an announcement will be made in these columns.—CYRIL HARDING, General Secretary, 22, Buckingham Street, Strand, W.C.2.

SURREY JOINT POOR LAW COMMITTEE. THE OAKS HOME, WOODMANSTERNE, FOR SANE FEMALE EPILEPTICS.

APPOINTMENT OF RESIDENT WOMAN GARDENER.

THE JOINT COMMITTEE are desirous of receiving applications from suitable persons for this appointment. The person appointed must be experienced in Outdoor gardening, and capable of taking charge of a working party. Some knowledge of the keeping of Poultry and Pigs desirable. Salary, £52 per annum, with uniform (including boots), and the usual residential allowances. Forms of application and list of duties can be obtained on application to me. Applications duly filled up in candidates own writing, to be sent to me by or before the 11th July.—H. LIST, Clerk to the Joint Committee. Union Offices, Mayday Road, Thornton Heath. 25th June, 1919.

WANTED, as soon as possible, a scientifically trained and thoroughly experienced HEAD GARDENER, with expert knowledge of all branches of Flower, Fruit, and Vegetable gardening; capable of giving instruction in these subjects, with a good knowledge of book-keeping and business management; some knowledge of bee keeping and dairy and poultry work would be a recommendation.—Apply, giving full particulars of training, scientific instruction undergone, and experience and salary required, to Mr. PETER KEITH, Ulbster Estates Office, Thurso.

WANTED, for 20th July, HEAD GARDENER, where three Under-Gardeners are kept; must be a good manager, with an up-to-date knowledge of growing and disposing of produce for sale, and thoroughly up in all Inside and Outside work; wages 45s. a week; cottage and share in profit sharing scheme. Apply, stating experience, to LORD CHARLES BENTINCK, Ranby Hall, Lincoln.

WANTED, GARDENER (SINGLE-HANDED); married (no young children); near Tunbridge Wells; care of house part of year; state wages.—Apply, M. C. HARDING & IVORY, Newsagents, Victoria Grove, Kensington, W.

WANTED, Single-handed GARDENER. Thoroughly experienced Herbaceous Plants, Vegetables; about one acre under cultivation; practically no glass; on account of difficulty lodging accommodation, single man desirable. Wages 45s.; no cottage. —Apply to R. M. WOOD, Flint Cottage, Box Hill, Dorking.

GARDENER wanted to take charge, with boy, of Flower and Kitchen Garden; one with experience in Poultry and Oil Engine preferred.—State experience and full particulars, A. A. BARRON, Headlands, Berkhampstead.

GARDENER WANTED, well experienced Carnations, Roses, Fruit Trees, and Vegetables; Lad kept, and extra help when necessary; wages 55s.; state age, and experience.—CHARLES PHIPPS, Cliftonville, Northampton.

GARDENER (SECOND), Inside and Out; wages 34s., with good cottage.—GOODBOURN, Harwood Lodge Gardens, Wootton, near Newbury, Berks.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

PRESENT - DAY GARDENING

SWEET PEAS

NEW edition by Horace J. Wright, with chapter on "Sweet Peas for Exhibition" by Thos. Stevenson. Contains 8 plates in colour. Price 3/- post free.

THE PUBLISHER,
The Gardeners' Chronicle, Ltd., 41, Wellington Street, Covent Garden, London, W.C 2.

THE GARDENERS' CHRONICLE.

The Gardeners' Chronicle is the only gardening paper with nearly eighty years of history behind it. It was founded in the dawn of what is commonly termed the scientific age. It has seen the rise and development of the railway, and its partial supersession by motor road traffic; the discovery of the power of electricity, and its application to a bewildering multiplicity of every-day affairs; the economic emancipation of women, and their entry into industrial life; and, last of all, the discovery of the flying machine—so long believed to be impossible. **The Gardeners' Chronicle** has not remained static through all these marvellous changes. It has grown, developed, expanded. It has remained throughout its whole career completely in sympathy with its readers. It has advanced with them, explored with them the realms of experiment, examined with them in a spirit of intelligent sympathy every new theory of botanic or horticultural science, provided a medium whereby they have been enabled to communicate with each other and make their discoveries known. It is revered for its great age, yet respected for its modernity; it has the experience of years and the elasticity and progressiveness of youth. Through the storm and stress of the past five years it has stood unmoved, and it looks forward in full confidence to the enjoyment of the ampler scope and increased opportunities which the termination of the war will bring.

FERNS AND FERN CULTURE

By J. BIRKENHEAD. Revised by F. PARSONS.

THIS little work contains all that the Fern-lover needs to know about the raising and cultivation of Ferns. It tells him where the different classes of Ferns are to be found growing wild; the modes of growth of the different species; the sort of treatment each kind of Fern requires; how to tend the plants in sickness and in health; how to eradicate the pests, both insect and fungous, which threaten their well-being. It is freely illustrated, and all the illustrations serve a definite purpose. The book is excellently printed, on clear, good quality paper; it is well bound in pale green cloth, and this is protected by a second cover of transparent, grease-proof paper. Although so reasonable in price, it is worth almost any money, for it is quite unique.

Send 1/3 for a copy, post free, from

GARDENERS' CHRONICLE, Ltd., 41, Wellington St., Strand, W.C.2.

ANNUALS HARDY and HALF-HARDY. By C. H. CURTIS, late Hon. Sec. of the National Sweet Pea Society.

SWEET PEAS. By HORACE J. WRIGHT, late Secretary and Chairman of the National Sweet Pea Society. With Chapter on "Sweet Peas for Exhibition," by THOS. STEVENSON.

ROOT and STEM VEGETABLES. By ALEXANDER DEAN V.M.H.

DAFFODILS. By the Rev. J. JACOB, Chairman of Committee of the Midland Daffodil Society, with preface by the Rev. W. WILKS, M.A.

LILIES. By A. GROVE, F.L.S., with preface by H. J ELWES, F.R.S.

DAHLIAS. By GEORGE GORDON, V.M.H.

TULIPS. By Rev. J. JACOB.

CLIMBING PLANTS. By WM. WATSON, with introduction by WM. ROBINSON, Author of "The English Flower Garden." (Double volume **3/6**.)

Each Volume 3/- post free (CLIMBING PLANTS, double volume, 4/- post free) to be obtained from

GARDENERS' CHRONICLE, Ltd., 41, Wellington Street, Covent Garden, London, W.C.2.

Gardeners' Chronicle Horticultural Directory.

There are still a few copies of the *Horticultural Directory* on sale, but the 1919 edition is now nearly exhausted, and those who wish for a copy should write at once.

Gardeners who have surplus fruit for which they desire to find a market should consult the list of SALESMEN in all the largest towns of the United Kingdom, which is to be found on page 275 *et seq.*

Demobilised men who desire information of the whereabouts of their gardener friends will find the list of gardeners' names and addresses invaluable.

Apply, enclosing 2/- for each copy required, to :—

THE MARKET FRUIT GARDEN.

THE recent spell of drought lasted thirty-eight days in my district, except for a fall of one hundredth of an inch of rain on June 4. Even when it was at length broken on the 20th, it was by only .43 in. of gentle rain, which was hardly enough to pass down among the haulm of Potatos, and quite inadequate for fruit trees or even bushes. The total for the month was only just over half an inch, which fell on four days, so that it was the driest June experienced during nineteen years at this place. The combined rainfall of May and June was only .76 in. The effect of such a dry period has, of course, been disastrous to bush fruits and Strawberries. Of the former, Black Currants are the only crop grown here commercially. The gathering of these began on the last day of the month, and it is evident that the yield is very short, though the fruits are larger than might have been expected. Dropping has been very serious, particularly in the older plantations. Orchard trees have stood the drought very much better, owing, no doubt, to the plentiful supply of moisture, low down in the soil, from the heavy winter rains. A good many Plums have turned yellow, it is true, and will certainly drop, and there has been much cracking amongst Apples, but otherwise most of the trees look remarkably healthy. Most of the insect pests have either been killed by spraying or have completed the destructive period of their existence, and there is unusually little fungus disease about. Naturally the dry weather has been against the development of such diseases as scab and brown rot.

THE APPLE CROP.

If rain falls soon I expect to have a good crop of Apples, though certainly not a great one. It is seldom that so many varieties bear a fair crop in one season, and that is what will tell rather than the amount of fruit per tree. There are scarcely any failures amongst the varieties, though few of them are heavily laden. This is probably fortunate in such a season, for some trees of Lane's Prince Albert and Lord Grosvenor, which were the only sorts to set a big crop, now look very bad, having been unable to stand the strain of carrying so much fruit in such a dry period. Most other varieties have, as a rule, set only one fruit to a truss, and it is clean and of good size. Some of the best-selling Apples are amongst the most promising, notably Beauty of Bath, Gladstone, Cox's Orange Pippin and Allington Pippin. That most regular cropper, Worcester Pearmain, will yield lightly this year.

LUCERNE IN ORCHARDS

Several times in these notes mention has been made of an eight-acre Apple orchard sown with Lucerne, the object being to try the effect of what is called in America the "sod and mulch" system. This is now being mown for the third year, and the greenstuff spread and left to rot under the trees. In previous years no benefit has been observed, but this season it is unmistakable. The trees have withstood the drought much better than those on cultivated land. There are blocks of Beauty of Bath in adjoining plantations, one under Lucerne and the other cultivated, and there is a roadway through the dividing hedge just at that point. No one could fail to notice that the trees on Lucerne are much happier than the others. There is more young growth, though the trees are older, and the leaves are a better colour. At first-thought, one would imagine that trees on cultivated land would have the advantage in a dry summer It must be remembered, however, that the Lucerne orchard has now had the benefit of five heavy mulches of greenstuff, for it is mown twice annually, and has just had the first cut for the present (third) year. Moreover, Lucerne is a plant which gathers nitrogen from the air. Therefore the soil must have been greatly enriched in both nitrogen and humus, and the effect of this is evidently beginning to show.

CUTTING DOWN EXPENSES.

This subject of cover crops in orchards is of importance now that wages are so high. It is almost essential to reduce the amount of digging and hoeing done in fruit plantations. I am satisfied that the reduction of expense is considerable. Mowing this year worked out at about 14s. per acre. A one-horse mower cut down between the rows, leaving narrow strips of Lucerne actually in the tree rows to be cut with scythe and hooks. This must be done twice in the year, which makes the annual cost 28s. per acre. If this plantation were broken up, it could be ploughed in autumn and horse cultivated between the rows in spring and summer, but the tree rows would have to be hoed by hand and occasionally dug. Even if it could be cultivated in two directions, there would still be a space round each tree to hoe. Cultivation and hoeing would have to be done at least four times a year. Obviously this would cost a great deal more than 28s. per acre, without the ploughing and digging, which would be needed every two or three years, if not each winter. I should say that the annual cost under cultivation would be three or four times as great. There is, of course, the initial cost of sowing with Lucerne, but this should be much more than discounted by the saving in manure effected by the mulching system.

CHOICE OF COVER CROPS.

Lucerne will not thrive in all soils. On my land it does not do really well, weeds encroaching on it very soon. The plantation in question has now quite as much grass and white Clover as Lucerne. Indeed, in spring, the Lucerne looked like being a complete failure, but it grew into a fairly good crop in the end. Next autumn it will receive a dressing of basic slag, which should help it and the Clover as well; but I am afraid the Lucerne will not last many more years, particularly where the trees are dense enough to shade it much. Possibly the Clifton Park mixture of seeds for permanent pasture, which contains several Leguminous plants as well as grasses, would suit the purpose, or some other mixture of grasses and Clovers. Cocksfoot, which is known as Orchard Grass in America, seems to thrive under trees. The matter might well be taken up by experiment stations, for many growers are letting their orchards grass themselves down, owing to the shortage and expense of labour; and this plan is certainly inferior to the sowing of some crop or mixture adapted for the purpose. A word of warning is advisable, perhaps, against the grassing down of young plantations. This has been proved to be very injurious, having a markedly stunting effect on growth. The trees should be at least twelve years from planting before land cultivation ceases.

BIRDS MULTIPLYING AGAIN.

All gardeners have noticed the scarcity of birds during the past two years, and many attribute the caterpillar plagues to this. Now the birds seem to have had a good nesting season, and to be increasing again, for there are many youngsters about. Before the winter of 1916, all Strawberries and bush fruits in my private garden had to be netted, and Cherries were practically grown for the blackbirds and starlings. For two years afterwards netting was not necessary. Now these birds are becoming troublesome again. Jays also are numerous, and have played havoc with Peas as well as fruit. I have shot seven of them to-day. It will be interesting to see whether the caterpillars decrease as the birds multiply. The question is whether the caterpillars are not preferable to birds when the latter become very numerous. The insects are fairly easily dealt with by spraying and grease-banding, but it is very annoying to grow fruit and then have half of it spoilt by birds. Often the grower suffers loss by having to gather a crop unripe to save it from these thieves. *Market Grower.*

THE ROSARY.

ROSES FROM AUSTRALIA.

THROUGH the kindness of Mr. Alister Clark, of Glenara, near Melbourne, I received four Roses of his raising. I planted them against a south wall, and am now able to write of their behaviour in this country.

RUBY RING, which, on the whole, I like the best, is a showy Wichuraiana of moderately strong growth and good habit. The foliage is glossy and good, and does not hide the flowers. The blooms are about $2\frac{1}{4}$ inches across when expanded, and have a white eye surrounded by a ring of ruddy pink, not inaptly described in

the name of the Rose as ruby. They are single and something between Leuchstern and American Pillar in character. The plant seems to be quite hardy, grows about 7 or 8 feet high, and is free from mildew. Mr. Clark recommends it for a hedge.

MILKMAID is a very vigorous climber, with clusters of yellowish-white, slightly fragrant flowers, and seems to be connected with the Musk or Noisette Roses. The flowers are double, and in general tint bear some resemblance to Alister Stella Gray. It promises to be a useful variety for pergolas and arches.

ROSY MORN is a very distinct variety. It is a vigorous climber, with plenty of the H.T. character. It has large, loose, pink flowers, which look very well on the plant and last fresh for some time, but they are lacking in form and of little use for decoration in the house.

JESSIE CLARK, the last of the quartette, promised to be the most interesting, for it is a seedling from R. gigantea, and produced fine growth with lovely bronzy foliage. But alas! that is all I can say for it, for, like so many of the gigantea seedlings, this country appears to be too cold for it, and it has failed to flower with me. The flowers are said to be pink.

I have been much interested in these Roses from the other side of the world, and glad to give them a welcome. They seem to have readily adapted themselves to the change from the southern to the northern hemisphere, and even the first year I had them showed no disposition to resent transference to a part of the world where summer and winter had changed places. From what Mr. Clark informs me, I gather that he is not the only raiser of new Roses in the Antipodes, though few of these new Roses, I think, have yet reached this country. Australia has already sent us some good seedling Daffodils, and it is pleasant to think that the raising of new Roses is also being seriously undertaken. *White Rose.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM MIGUELITO.

A PRELIMINARY commendation was given to Dr. Miguel Lacroze, Bryndir, Roehampton (Orchid grower, Miss Roberston), for this handsome Odontoglossum, at the meeting of the Orchid Committee of the Royal Horticultural Society on April 23, 1918, the flower showing specially good qualities on the small seedling flowering for the first time. At the meeting on the 17th ult., Dr. Lacroze again submitted the plant with an unrestricted spike of three noble flowers, one of which is illustrated in Fig. 8. An Award of Merit was accorded the plant on that occasion. Odontoglossum Miguelito resulted from crossing O. Dora (Lambeauianum × Pescatorei) and O. Doris (crispum × Ossulstonii). In the combination O. crispum and O. Pescatorei predominate, and O. Harryanum, as it generally does through secondary crosses, has doubtless tended to give greater size; the flowers, however, retain the desired form of the best O. crispums. The colour of the markings is deep violet purple, the ground being white, tinged with rose, the reverse of the flower also showing this colouring as on the face.

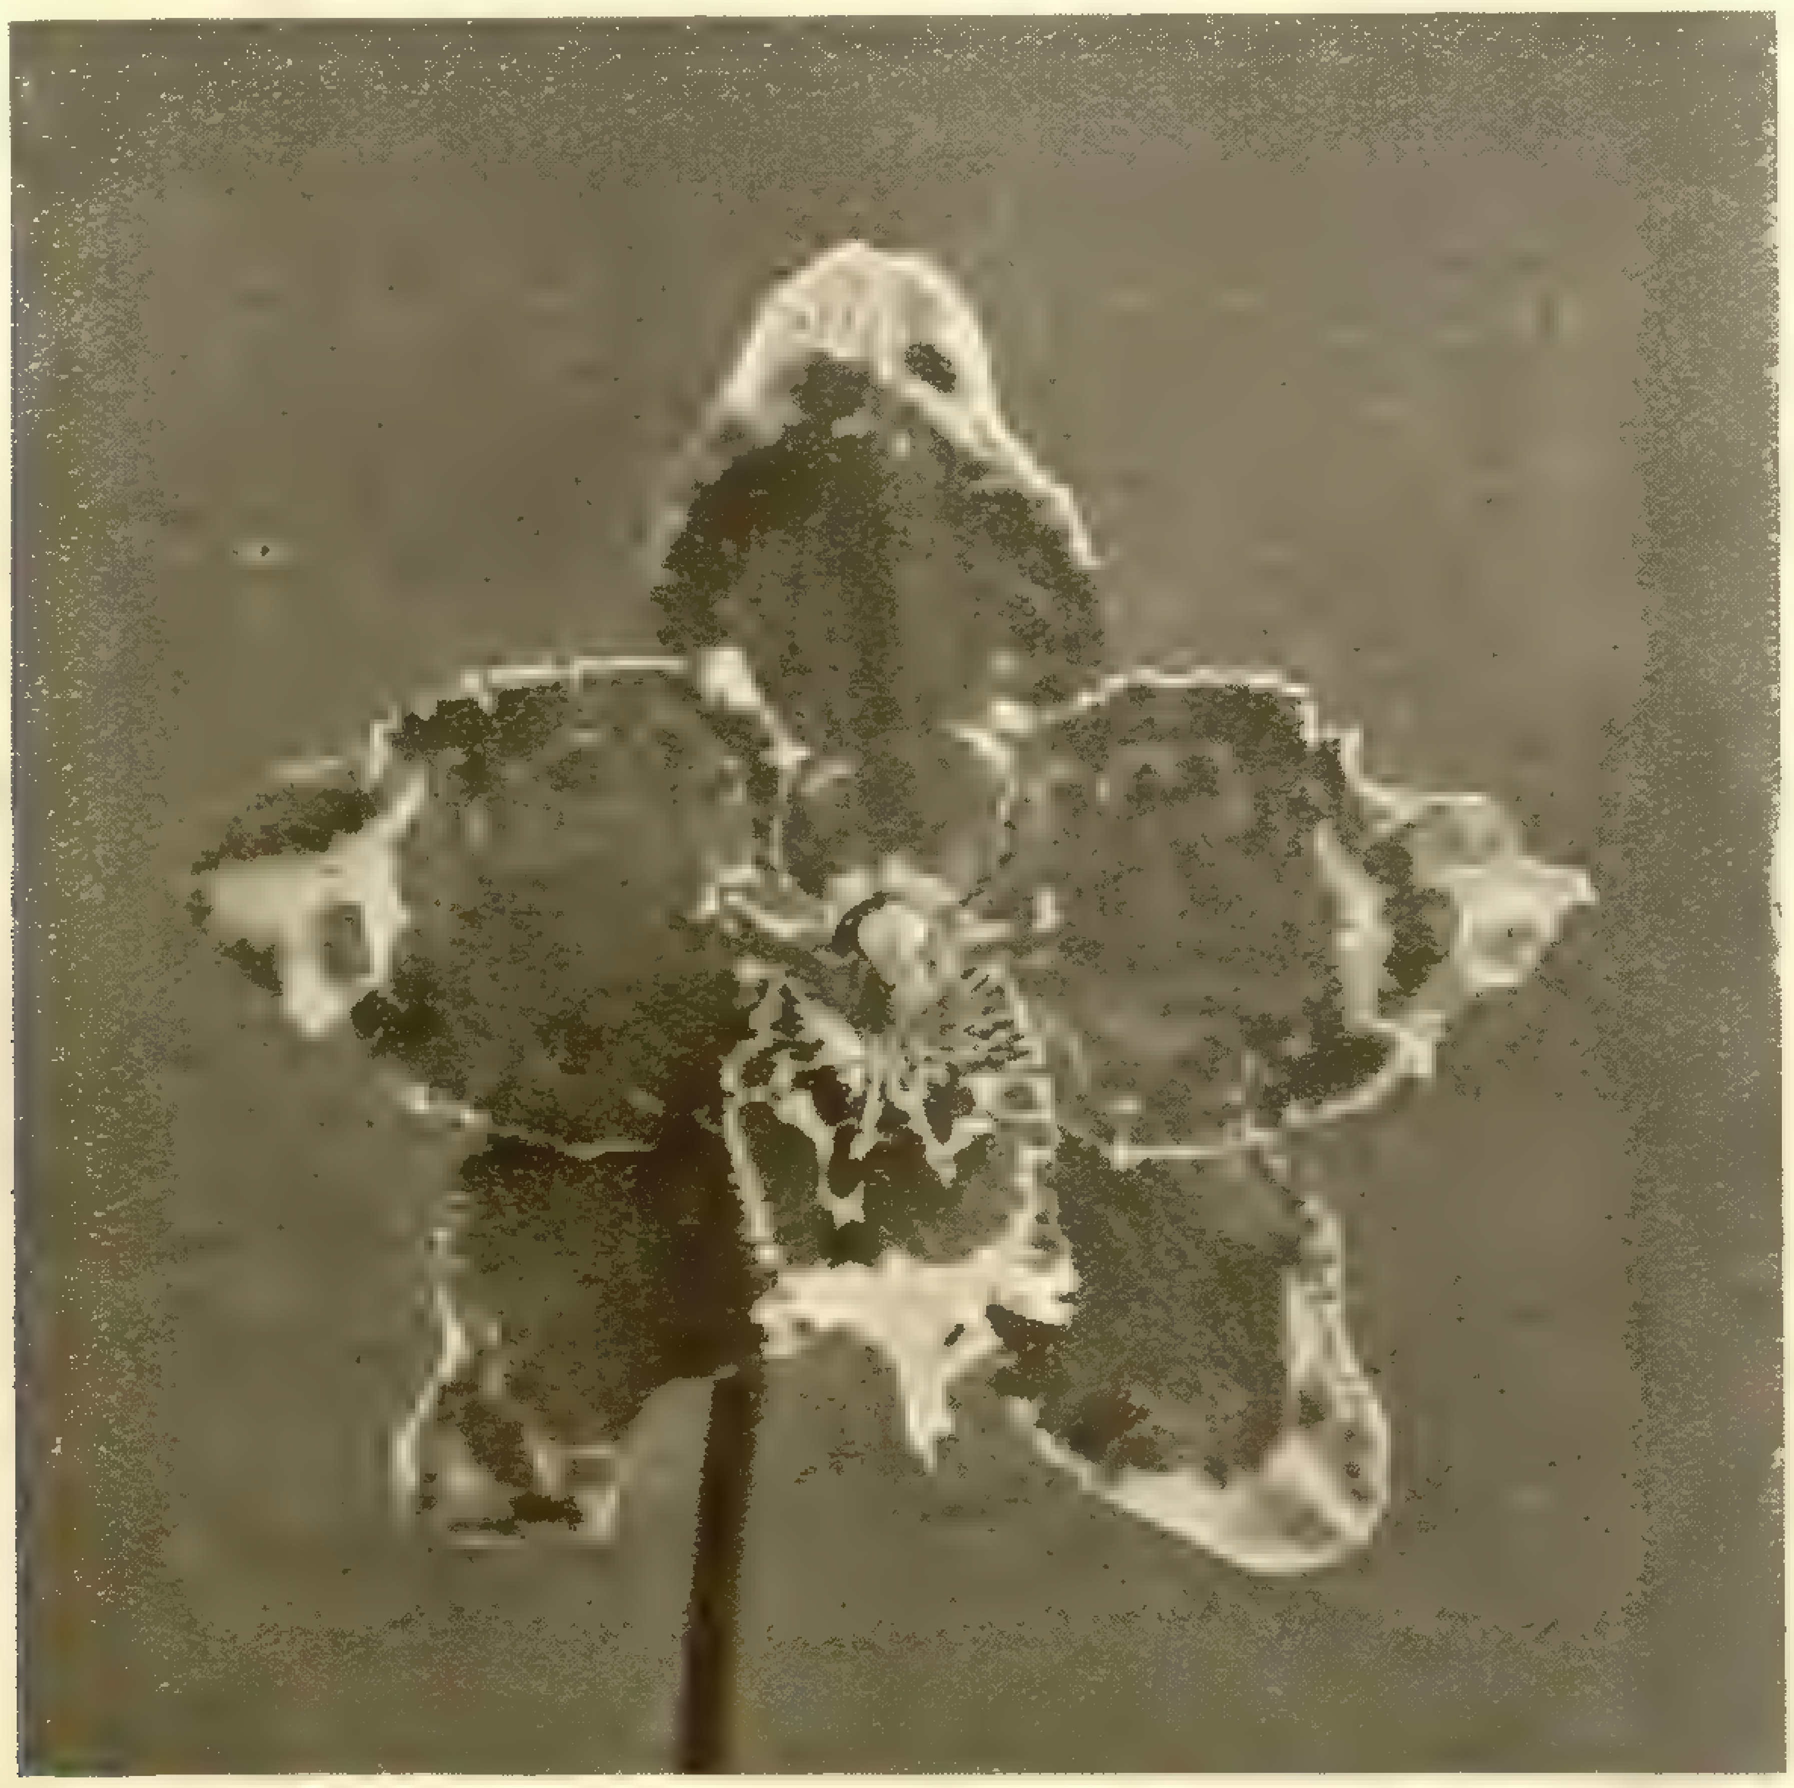

FIG. 8.—ODONTOGLOSSUM MIGUELITO.

FORESTRY.

THE COMMON ASH AND THE AMERICAN WHITE ASH.

THE common Ash, Fraxinus excelsior, is one of the most valuable timber trees to plant in the British Isles in places where the soil is suitable, for it usually realises a higher price than Oak and has the advantage of reaching a suitable age for felling earlier than that tree. Moreover, it has many uses for which substitutes are difficult to find, and there is no reason to imagine that its usefulness will depreciate; in fact, timber of first-rate quality is likely to be in demand for the manufacturing of aircraft until such time as metal takes the place of wood. Even then there are many purposes for which the strength and toughness of Ash wood are necessary which are likely to absorb all the timber that is placed on the market. The only tree that has been suggested as a rival for the common Ash is the American White Ash (Fraxinus americana), but although that is a fast-growing tree producing good quality timber, it is only likely to become a companion to the European species and there is no reason to suppose that it will prove superior either in rate of growth or in quality of wood.

There are many methods of cultivating the common Ash, and the same applies to the American White Ash. It may be grown as pure plantations, mixed plantations, coppice, as hedgerow trees, or as ornamental trees. In some districts Ash trees are very common in hedgerows and along the sides of roads, but the Ash is not an ideal hedgerow tree, for the roots travel to a considerable distance and impoverish the ground far beyond the radius of its branches. For the same reason it is not a desirable garden tree, for it is impossible to succeed with any other plants of importance planted near by unless the roots of the Ash are constantly kept within bounds.

Where the common Ash can be planted in plantations without interfering with less vigorous plants, it grows rapidly and produces timber at a greater rate than most other valuable hardwoods. Moreover, plantation-grown trees have an advantage over those grown in hedgerows or as ornamental specimens, for they grow up with few side branches and any branches that are formed are killed from want of light before they are large enough to leave behind them knots that will seriously injure the quality of the timber.

As a rule the timber of hedgerow trees is decidedly inferior to that of trees grown in plantations, largely by reason of its knotty character, but also on account of the trees being left standing until the wood darkens in colour and begins to deteriorate. The best Ash wood

is light in colour, straight grained, quickly grown, and comparatively young. When old trees are felled the wood in the centre will often be found to be dark in colour, and such timber realises a lower price per cubic foot than that of clean, young trees. Coppice Ash is often used for stakes and for splitting for hoops and various other purposes, whilst young saplings find a market as walking sticks.

Ash trees give the best results when grown in good, deep, loamy soil, but they also grow well in ground of inferior quality provided it is naturally moist. They also succeed in poor soil of a sandy character, but the results are less favourable than when the ground is of better quality and moist. They succeed throughout the country and withstand exposure to sea air. On the cliffs near Swansea are trees exposed to the full force of the winds from the sea, which, though not well developed, are quite healthy. The common Ash is a good town tree, and in the smoky atmosphere of Glasgow where other trees, such as the Horse Chestnut, are a failure, the Ash flourishes.

As is the case with most other trees, the Ash grows more vigorously if planted in ground that has been worked than when it is notched into unworked land, and whenever possible it is wise to plough land that is to be planted. As a rule the smaller the trees at planting time, the better they succeed, and in some cases it may even be advisable to sow seeds in the places the trees are to occupy. The disadvantage in seed growing or in planting very small trees, say 12 to 15 inches high, lies in the fact that if not carefully tended for a year or two they are apt to be smothered by rank weeds. For hedgerow planting it is necessary to plant trees that rise well above the hedge or to take care that they are given ample room until strong enough to fight their own battles.

In proper Ash plantations, trees may be planted 4 feet apart or seeds sown in patches at the same distance. They may be allowed to remain at that distance for some years and, later, the removal of suppressed trees will probably be sufficient in the first place to give the necessary relief. Excessive thinning should be avoided, for in the first place, straight, slender trunks free from large branches are required. When the trees have attained the necessary height, sufficient thinning to allow of the development of the head will result in a more rapid girth development.

There are several diseases that attack the Ash. One of the worst is canker caused by a bacterial disease. This is easily detected, for it forms ugly, cankerous wounds which not only disfigure the trees, but injure the timber. Both young and old trees are affected, and there appears to be no other means of checking the spread of the disease than by burning affected wood. Trees grown in dry positions are sometimes seriously injured by scale insects which entirely cover the bark and live on the sap. Affected trees have a sickly appearance, lose numerous branches, and eventually die. Young trees may be sprayed with a paraffin wash when the larvae are active, which is usually early in May. The active stage is of very short duration. Ash buds are sometimes injured by the larvae of a moth. The Goat Moth and Wood Leopard Moth find the wood a congenial feeding place for their larvae, and the larvae of several beetles, especially Hylesinus fraxini and H. crenatus feed in the cambium between bark and wood, and do a large amount of damage.

The age for felling trees depends upon circumstances, but on good ground excellent timber may be obtained from trees 40 years old: trees younger than that have been cut during recent years. Such trees should be tall, straight, and clean stemmed, with comparatively little taper in the first 20 feet. The maximum height of the Ash varies in different parts of the country, but there are perhaps no finer specimens than are to be found on Lord Darnley's estate, at Cobham Hall, in Kent; a tree blown down and measured as it lay on the ground was 155 feet in length, whilst a section of timber cut from a point 20 feet above the ground measured 3 feet 4 inches in diameter. *W. D.*

CULTURAL MEMORANDA.

STRAWBERRIES.

To extend the season of this delicious fruit to its utmost is well within the possibilities of most gardens, provided care is taken in the selection of varieties, and reasonable cultural requirements are provided by the grower. Where early forcing is regularly practised, a bed of plants is usually reserved expressly for furnishing a supply of strong early runners, but in cases where this provision has not been possible, excellent plants for pot culture may be obtained by selecting, at the earliest opportunity, strong runners from fruiting plants, and pegging them down in small pots filled with good soil. For general convenience the pots should be plunged at least half their depth in the bed. Every attention should be paid to these runners, as unless they make strong plants successful forcing is impossible. When the runners are well established, and after they have been severed from the parent plant a short time, they should be potted direct into their fruiting pots, those having a diameter of six inches being usually employed. The pots should contain a moderate quantity of crocks for drainage. Strawberries are not fastidious in regard to soil, but they grow best in strong loam, four parts, to one of well-decayed manure, further enriched with bone-meal, or a lasting fertiliser, and with a liberal quantity of lime refuse added. No useful purpose is served by making the soil too fine, but firm potting is essential, and the plants should not to be buried too deeply. When potted, stand them on an ash base in the open, and see that they are kept well watered, and syringed freely in hot weather. Should red-spider appear on the leaves, apply a suitable insecticide with considerable force. Mildew is another evil, and with this trouble prevention is better than cure. Therefore the plants should be sprayed occasionally with liver of sulphur at a strength of one ounce in three gallons of water in dull weather. When heavy rains begin to fall in autumn, place the pots on their sides under the shelter of a low wall till they are required for forcing. Strawberries are not, as a rule, prone to blindness, but a sharp look-out should be kept for any that show this defect when top-dressing them just previous to their removal to the forcing house. Throughout the whole period of forcing watering is an important detail of cultivation. During the early stages of forcing, when there is a gradual rise in the temperature from 45 degrees to 60 degrees, it is not difficult to keep the roots moist, but as the year advances and the sun gains power, the plants, being staged near the roof glass, should be examined frequently for watering, as they are quick to suffer from the least neglect. Moreover, it should be remembered that there is little or no benefit gained from feeding a dry soil. On no account should the plants be allowed to flag, for they rarely regain their former vigour when the roots are allowed to become excessively dry. Royal Sovereign is still one of the most reliable varieties for forcing, and King George is also useful.

To obtain early fruit in the open the same steps should be taken to secure plants as for forcing, and the earlier these can be got into their permanent quarters the better. A favourite site for Strawberries is one that was well prepared for early Peas the previous autumn. Other plots, perhaps not so well treated, should be dug deeply and well manured some time in advance of planting, in order to allow time for the soil to settle. In cases where the soil is of a particularly heavy nature the young plants will obtain a better start if the rows are made in the form of a narrow trench, and filled with old potting soil. Robust growing sorts, such as Royal Sovereign, that are intended to remain for two or more years should be planted in rows $2\frac{1}{2}$ feet apart and 2 feet in the row. Others of a more compact habit, such as Laxton's Latest, will have plenty of room if the rows are 2 feet apart.

Make the soil firm about the roots when planting. If it is necessary to plant in dry weather, see that the runners are watered regularly until their roots are established in the soil, after which an occasional watering with liquid manure will be highly beneficial. All runners should be removed at an early stage of their development. Plants thus treated produce fruits of high quality a little in advance of older plants.

In order to prolong the season of this fruit to its utmost a careful selection of varieties is necessary. For the earliest supply, Royal Sovereign and Vicomtesse Hericart de Thury are both reliable sorts; for following these choose Bedford Champion and Laxton's Leader, and, for main crop, Fillbasket and President. All these Strawberries should be planted in an open situation, but a north border is best suited for such late varieties as Givon's Late Prolific and Laxton's Latest. *F. T.*

FIG. 9.—CYDONIA JAPONICA VAR. WILSONII: COLOUR OF FLOWERS SALMON-PINK.

CYDONIA JAPONICA VAR. WILSONII.

This member of the Quince family, which is known in the United States as "Chaenomeles lagenaria var. Wilsonii," was found by Mr. E. H. Wilson in the province of Western Szechuan during his plant collecting expeditions in China during the years 1908 and 1910, and on both occasions he discovered it as a cultivated tree.

It flowers during May, forming a useful addition to the early blossoming trees, and is a striking subject when in bloom: the flowers are of medium size and coloured salmon-pink. But the chief attraction of the tree lies in the large fruits, which are from 4 to 6 inches long and about two-thirds of these measurements broad.

FIG. 10.—CYDONIA JAPONICA VAR. WILSONII: A YOUNG TREE IN FRUIT AT ALDENHAM HOUSE GARDENS.

It is remarkable how large a quantity of fruit a comparatively small tree will carry. At Aldenham one specimen measures about 15 feet high and, when nine years old, it bore about 100 of the large fruits and formed a striking object during the autumn. The flowers are illustrated in Fig. 9, and the tree in fruit in Fig. 10.

The fruit is very aromatic, keeps well and is of service for the manufacture of jelly and other preserves in the same way as the ordinary Quince, though they do not colour to the same perfection at Aldenham as they would in a warmer climate, where they turn golden and red.

This variety is easily propagated from seed. It received an Award of Merit from the R.H.S. on August 31, 1915. *E. Beckett.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Coelogyne.—The species C. asperata, C. Dayana and C. Massangeana are remarkable Orchids that flower at this season of the year. Though their colours are not particularly bright, the flowers to these Coelogynes produce a fine effect when the plants are well flowered, as the graceful racemes present an appearance quite distinct from other members of the genus. All the species named have much the same habit, but C. Massangeana is not quite such a strong grower as the others, and will succeed in less heat than is necessary for them, the intermediate house suiting it best. Plants of the strong and free-growing kinds require good-sized receptacles provided with ample drainage, and they are best cultivated in shallow pans or baskets suspended from the roof-rafters under moderate shade. When well established they require copious supplies of water during the growing season and for this reason, when providing new rooting material, especially for large specimens, a supply of large, rough pieces of charcoal should be worked into the compost. This will ensure a sweet root run. The plants should be potted in two parts rough peat, Osmunda, or Al fibre, with a portion of light turfy loam, and Sphagnum moss. The best time to afford new rooting material is in early spring, when the plants first show signs of activity, but they will not require very frequent disturbance provided good rooting material is employed at the repotting. These plants usually rest during the winter, and a greatly diminished water supply is then required, but they should not be allowed to get dry enough to shrivel.

Cycnoches, Catasetum, and Mormodes. These peculiar Orchids are not generally grown, although they are decidedly interesting and worthy of the attention of cultivators. At the present time, when these plants are in full growth, they require plenty of heat, and they are best grown suspended close up to the roof-glass, and afforded a light position. Whilst they are making their growth and root action is free, they should be supplied with abundance of water both to the roots and in the atmosphere, and in bright weather the foliage should be syringed freely to counteract the spread of red spider and other insects. After the flowering period, which takes place as the pseudo-bulbs become mature, the plants should be afforded more air and sunlight to ripen the bulbs, and a plentiful supply of water at the roots should be provided until the bulbs are ripe and the leaves have fallen. After this has taken place the plants are very impatient of moisture, and water must therefore be almost entirely withheld, and during the resting season the plants should be placed in a position where they will receive all the sunshine and light available.

Stanhopea.—This is another genus that does not find much favour with the majority of Orchid growers because the flowers are short-lived, and also because of the unsuitability of the flowers for cutting. The best species are, however, attractive Orchids, and worth growing where room can be provided for them. They are easily cultivated and free flowering. The flower spikes being pendulous, often pushing their way downwards through the compost, the plants are best grown in open, teak wood baskets, so that the spikes can readily find an opening to push their way through. The baskets should be well drained, using pieces of charcoal for the purpose in preference to crocks. Stanhopeas thrive best suspended from the roof, and the heat of the Cattleya house will be found ample for them. Although a clear light is beneficial, the plants should be shaded from strong sunlight, as very bright sunshine injures the foliage. During the growing season these plants delight in abundance of water both at their roots and overhead, but when growth is finished the plants should be rested in a cooler house, and at this time very little water will be requisite, only enough being given to keep the pseudo-bulbs from shrivelling.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Cucumbers.—Where Cucumbers are growing on the southern side of the plant house they should be lightly shaded during the hottest part of the day, especially if the plants are in bearing. Keep the atmosphere well charged with moisture, the bed well moistened, and the walls and foliage sprayed morning and evening. Regulate the growths as this lengthens the cropping period. Top dress the beds lightly with turfy loam and decayed manure in equal parts whenever roots appear on the surface. Young successional plants will need stopping; allow no fruits to develop on them until they are well-established.

Tomatos.—The spring-sown batch will now be in full bearing, and will need care and attention to keep them in health and fruitfulness. Do not allow them at any time to become dry at the roots or the fruits will crack after watering, while if overfed they become too vigorous to set their fruits properly; therefore regular top-dressings with loam and a little burnt garden refuse is the most satisfactory means of securing an evenly-balanced growth A good liquid manure may be

made of one part each of horse and cow manure and a quarter part of soot; place the whole in a bag and put it in a tub of water; dilute the liquid with clean water when applying it. The fruits should be gathered as soon as coloured.

Vegetable Marrows.—Continued dry weather affects Marrow plants, therefore regular applications of clear water and liquid manure should be given. Thin the growths if overcrowded and pinch out the points of the longer, rambling shoots.

French Beans.—A sowing of French Beans may still be made on a warm, sheltered border to provide autumn supplies. These later batches should be sown in beds that may be covered by frames to protect the plants from autumn frosts.

Turnips.—These will require close attention at this season. Choose a shady site and thoroughly soak the drills before sowing the seed. A light covering of short lawn grass mowings placed over the entire bed will ward off the Turnip Flea. Red Globe types are excellent varieties to grow at this season.

Peas.—If late varieties are sown now, place the seeds somewhat thinly in the drills as the plants are likely to grow grossly in the autumn and become susceptible to mildew.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Statice profusa.—This most valuable decorative greenhouse plant lasts a long time in bloom, and the flower spikes may be used for winter decoration by cutting them when the flowers are opening and hanging them up to dry. Established plants will be benefited by a top-dressing of loam mixed with concentrated fertiliser and frequently watered with liquid manure. The shoots should be staked, otherwise they are liable to split from the stems. Statice profusa does not lend itself to the ordinary methods of propagation from cuttings. The best means of increasing it is to plunge the pots to the rim in a pit or frame in light, sandy soil, and layer the shoots in the surrounding soil. If layering is done at the beginning of the season of growth, finely rooted plants may be obtained for potting up in the autumn.

Climbers.—Allamandas, either planted out or in pots, should be carefully watered and given frequent applications of liquid manure. When the shoots have reached the desired length pinch out the points, as this will throw energy into the flower shoots. Syringe the foliage frequently. The tying up of young Lapageria growths should be attended to, and the plants should receive daily syringings and an occasional fumigation. Keep the roots sufficiently moist and then feed occasionally with liquid manure. Other climbers, such as Passiflora, Swainsonia, Tacsonia, Cobaea, Heliotrope, and Fuchsia should be carefully trained to rafters and pillars; cut back untidy shoots, and daily syringe the plants to keep the foliage clean. Any climbers that have finished flowering should be pruned, removing old wood and weak shoots, and affording ample space for the young growths that will flower next season.

Azalea indica.—When Azalea plants have finished their growth and formed flower buds, plunge the pots out of doors in coal ashes, preferably in a position shaded from full sunshine. Syringe them twice daily and occasionally with an insecticide to prevent attacks of thrip.

Camellia.—Camellias planted in borders should receive sufficient water to keep them thoroughly moist at the roots; it is also necessary to afford some stimulant, either by sprinkling a plant fertiliser over the surface of the border or by giving liquid manure. Ventilate the Camellia house as freely as possible and syringe the plants once daily to keep the foliage clean. Camellias grown in pots, when sufficiently hardened, may be plunged in ashes out of doors in a position sheltered from wind. Other hard-wooded plants, such as Erica, Deutzia, and Genista, may be plunged in ashes to the pot rim out of doors and syringed and watered as necessary.

Poinsettia.—Early-rooted cuttings should be potted into 5-inch pots: thoroughly soak the ball of roots before repotting, and use a compost of three parts fibrous loam and one of peat and sand. Place the plants in an intermediate temperature, and gradually inure them to more light and air, but supply water carefully until the roots are re-established.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Thinning Fruits.—All kinds of stone fruits should now be finally thinned. The number of fruits to be left on a tree depends upon its size and strength. A healthy tree may be allowed to carry more fruits than one in poor health, and the crop on young trees should be well thinned, otherwise growth will be retarded. Where the crop is properly thinned trees will carry a greater weight of finer fruit than in the case of half thinned crops. All kinds of fruits are better for thinning, and nothing helps more to keep fruit trees in good health than regular crops. Thinning should be done before the fruits swell finally before ripening.

Ants.—These pests are generally more troublesome in dry seasons than in wet ones, and every means should be adopted to get rid of them, as they are very fond of fruit. They favour wall fruit trees and are difficult to eradicate. Petroleum blown into their holes will drive ants away. Pots and sponges smeared with treacle or any kind of sweet syrup and laid at the foot of a fruit wall are quickly filled with ants and easily trapped thereby. Ants do not like ammonia, and where plenty of liquid manure is used it has a tendency to keep them away.

Gathering Cherries.—Fruits required for dessert should be cut with a portion of the stalk attached. Fruits required for packing or keeping should be gathered with the stalks intact and removed carefully from the branch. If picked in this way they keep much longer, and if thoroughly ripe will keep for some time if hung in the fruit room. The fruits should be gathered dry, and care should be taken not to rub off the bloom. Cherries may be kept for some time if the stalks are placed in water.

Watering.—Practically all fruit trees need watering regularly, as the recent rains have not been sufficient to moisten the soil down to the roots, especially in the case of wall trees. Nothing causes fruits to drop so much as drought at the roots.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Layering Carnations.—July and August are the best months in which to carry out the work of layering Carnations. Prepare some good soil containing plenty of grit, and sufficient pegs for the work. Clear a space beneath the plants and slightly loosen the surface soil. Then place the new soil where the layers are to be secured. Only layer a few of the strongest growths, and remove the rest. Trim some of the leaves from the base upwards on the growth to be layered to where the tongue is cut; peg down firmly, cover the wounds with the fresh soil, and give a good watering. The surplus shoots may be made into cuttings and will root readily in sandy soil under hand-lights placed in a shady position.

Pinks.—These should now be propagated from cuttings or pipings. Cuttings form roots quickly when dibbled into sandy soil under hand-lights, or in cold frames. Shading is most essential in bright weather, with plenty of moisture to keep the leaves fresh. As soon as rooted, the plants should be set out in prepared beds until required for planting out.

Seedling Pinks.—Seeds of all kinds of Dianthuses may be sown in pans filled with suitable soil, and with reasonable attention a good stock may soon be obtained.

Bedding Plants.—Keep all plants of trailing habit carefully pegged down and remove any dead leaves and flowers. Tall plants, such as Fuchsias, Heliotropes, and other subjects employed as dot plants should be neatly supported, or they may be damaged by winds.

Window Boxes.—These will be gay by this time, and every care should be taken to maintain a good display. Do not neglect to supply the plants with sufficient moisture and liquid manure, especially when the roots have fully occupied the soil.

Hardy Heaths.—Erica carnea and other Heaths employed as edgings to beds of Rhododendrons and Azaleas, and to rockeries, are most useful, and new stock should be raised annually. Open a small trench, two inches deep, round each plant, and layer the young side growths, excepting the tips, in suitable soil; press this firmly, and in due course an abundance of young plants will be obtainable. Heaths might be used more extensively for covering bare places which are unsuitable for growing other subjects.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Early Vinery.—As soon as the Grapes have been removed, the vines should be thoroughly cleansed by repeated forcible syringings. Every effort should be made to keep the old foliage healthy until the autumn, and thus help to strengthen the buds for next season. Growth will now be rapid, and to prevent crowding it must be kept within the space available. It is a good practice to slightly shorten the laterals in order that the basal buds may develop fairly. The ventilators should be kept wide open, both day and night, excepting during rough weather. The borders should be kept in a moist state and liquid or artificial manure afforded at intervals.

Successional Vineries.—In order to preserve the bloom and colour of the Grapes which are now ripe, the ventilators should never be quite closed, otherwise moisture will condense on the fruit and spoil the bloom. Damping should be done less frequently, but moisture must be afforded according to weather conditions, otherwise red spider will quickly increase. Where the Grapes are in the earlier stages of colouring, the vines should be afforded a fair amount of atmospheric moisture. Admit a small amount of air by night, and an increased quantity by day, until the Grapes are fully ripe. The night temperature should range from 60° to 65° for all varieties ripening at this period, with the exception of Muscats, which should be grown in a temperature of 65° to 70°.

Late Vineries.—The bunches should now receive their final thinning, and it is essential when Grapes are expected to hang until late in the season that the berries have ample room to develop, thus giving them every opportunity of becoming properly finished. The interior of the bunch should be well thinned, as this will to a certain extent prevent the accumulation of moisture during damp weather, and consequently the decay of berries is reduced to a minimum. The foliage and berries of certain varieties are at the stage when scalding is likely to occur. The berries of Lady Downe's are very liable to scald at the period just preceding their change of colour, but by admitting a little air through the top ventilators, keeping a circulation of heat in the water pipes throughout the night, and increasing the amount of air in the morning as soon as the warmth from sun-heat is noticed, scalding can usually be prevented. The amount of atmospheric moisture should be governed by the weather conditions; during dull, damp weather the supply should be considerably reduced. Ventilation will also demand constant attention during this critical period. If the vines are making a large quantity of lateral growths they must be stopped early, but this should always be done gradually.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, JULY 14—
United Horticultural Ben. and Prov. Society's Committee meet.
Bath Gardeners' Society meet.

TUESDAY, JULY 15—
Royal Horticultural Society's Committee meet. National Rose Society's Exhibition of seedling Roses; National Carnation and Picotee Society's meeting; lecture by Mr. A. D. Webster, at 3 p.m., on "Afforestation."

FRIDAY, JULY 18—
Birmingham Horticultural Society's Floral Fete at Handsworth Park, Birmingham. (2 days).

SATURDAY, JULY 19—
Peace Celebration Day.
Croydon Horticultural Society's Vegetable and Fruit Show, in the Public Halls, George Street, Croydon.
Brighton Horticultural Society's Outing.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich 63.1.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, July 9, 10 a.m.: Bar. 30.2; temp. 65°. Weather—Sunny.

The Botany of Crop Plants.* It is one of the most difficult tasks that a teacher can overtake to endeavour at one and the same time to inculcate a knowledge of scientific principles and to impart technical information. To succeed in the former, the teacher must select his facts and array them in an arranged order. He must go slowly and often go back in order to reinforce the implied argument; whereas so far as technical instruction is concerned, lucidity, accuracy and a sense of essentials are the chief requirements.

In producing a work which is at once text book and book of reference, the author has tried an experiment which although it cannot be regarded as wholly successful, is certainly interesting. His method is to give a rapid review of morphological and physiological botany and then to devote himself to a description of the chief economic plants of the farm, garden, and orchard. The general descriptions of agricultural and horticultural plants are well done and will prove useful to the student, although he will have to go elsewhere for much of the information necessary if he is to gain a sound knowledge of the applied botany of the plants with which he deals. For instance, in discussing the "running out" of Potatos, no reference is made to British experience, which demonstrates plainly enough the fact that degeneration is a matter of strains and not of varieties; nor does the author refer to the proved excellence of Scotch and Irish seed.

The chapters on fruit crops contain much that is of interest, although from our point of view not enough is said on the subjects of stocks, pruning or root pruning. The paragraph on the Loganberry requires revision, for it makes the contradictory statements that this fruit is a hybrid and that evidence exists that it is not a hybrid.

In the desire to include as much information as possible the facts given are at times apt to be scrappy. Thus it is difficult to see the value of stating that Dr. Diel's classification of Apples divides varieties into seven classes and to give without any description the names of the classes.

Although the statements made are generally accurate, we are not aware of the authority for the assertion that if the "common Apple" is grafted on the "wild crab" the fruit is more sour than usual. What is the common Apple and what the wild Crab? Very excellent are the keys to genera such as Prunus which accompany the descriptions of the various fruits, and the letterpress and illustrations are also admirable. It is, however, news to us that Nectarines appear on Peach trees and Peaches on Nectarines; we were of opinion that though the former happens the latter does not, and to that opinion we propose to adhere until the evidence to the contrary is forthcoming.

* *The Botany of Crop Plants.* A Text and Reference Book, by Prof. W. W. Robbins Pp 681. Philadelphia: P. Blakiston's Son and Co. 1917. $2 net.

Sulphur as a Fertiliser.* Many experiments have been made with respect to the value of sulphur as a fertiliser or as a means of sterilising the soil and thus indirectly benefiting crops. The results of these experiments have, however, not been uniform, for although in not a few cases beneficent effects have been observed, in others, the application of sulphur has failed to increase the yield. Recently the subject has been investigated by a number of different observers from new points of view, and it has been shown that when sulphur is added to the soil it undergoes oxidation as the result of biological action; that is to say, the sulphur plays a part in the metabolism of certain specific soil bacteria, and as a result is converted into sulphate. Of course it has long been known—since the work of Winogradsky—that sulphur bacteria of various kinds exist in soil and elsewhere which make use of this element in a way analogous to that in which the nitrogen bacteria make use of nitrogen.

But there would appear to be a practical value in these recent observations, for they show that in the course of the biological processes which lead to the oxidation of sulphur to sulphate the insoluble phosphates present in the soil become converted into a form in which they are available to plants. Tests made by mixing soil, sulphur and mineral phosphates show that the phosphate passes into a soluble form and hence that a compost made in this manner will serve as a useful substitute for superphosphate.

The proportion which gave the best results was 10 parts soil, 12 of sulphur, and 40 of mineral phosphate.

The addition of a trace of sulphate of iron and of sulphate of aluminium causes the oxidation of sulphur to go on yet more rapidly, and in practice to obtain this acceleration the amount of these materials which needs to be added is so little as 6oz. per ton of soil. Another point of interest is that the solubilisation of phosphates which accompanies the oxidation of sulphur by soil bacteria goes on more rapidly when the compost contains but little organic matter such as peat, fresh horse manure, or old composted manure.

It would be of interest to learn whether these observations might not be applied to gardening purposes—as, for instance, in the preparation of potting soils, and perhaps some of our readers may be able to carry out tests along these lines. It would also be interesting to know whether some of the benefits which are said to result from the partial sterilisation of soil by means of sulphur compounds, calcium sulphide, for instance, may not be due to the augmentation of the available phosphates in the soil.

* Internat. Review of the Science and Practice of Agric. Monthly Bulletin X. I. Jan., 1919.

New Garden Book.—*Days in My Garden* is the title of a book by Mr. Ernest Ballard, which will shortly be issued by the Cambridge University Press. The book will be illustrated by more than 130 photographs by the author, one of them in colour.

Retirement of Mr. R. Irwin Lynch.—Owing to ill health, Mr. R. I. Lynch has reluctantly been compelled to resign his office as Curator of the University Botanic Gardens. Mr. Lynch has held this position since October, 1879, but has now been advised by his doctor to avoid another winter at Cambridge. He will retire to Devonshire after Michaelmas of this year, but hopes still to contribute to *The Gardeners' Chronicle*, to which he has been a valuable contributor for many years. The Cambridge Garden, under the care of Mr. Lynch, has assumed a position in the front rank of botanical institutions and has played a most important part in University teaching. In 1906 the honorary degree of M.A. was conferred upon Mr. Lynch as an appreciation of his scientific work and able management of the Botanic Garden. Mr. Lynch will take with him into his retirement the good wishes of a very large circle of friends.

R.H.S. Teachers' Examination.—The first examination of the Royal Horticultural Society for candidates for Honours in the "Teachers' Examination in School and Cottage Gardening" has just been held, and the following have gained the certificate:—Section (*a*): General Horticulture—Miss E. A. Squire, Training College, Norwich; H. Sharman, 29, Sandringham Road, Northampton; W. Morley Chatterley, School House, Harvington, Evesham; James A. Harris, 9, Glasgow Street, St. James, Northants; H. H. Sterne, Hundon, Clare, Suffolk; R. J. Rowe, Gretton, Church Stretton, Salop; W. H. Baker, 75, Mitchell Street, Clowne, Chesterfield. Section (*b*): Fruit Growing in the Open.—W. E. Cole, Dyrham, Staple Hill, Bristol.

Educational Garden at Reading.—Dr. J. B. Hurry asks us to announce that his garden at Westfield, Reading, will be open to gardeners and other persons interested in economic plants on the 12th and 13th inst. between the hours of 3 and 6 p.m., when he will give demonstrations of the more interesting economic plants and their industrial products. Tea will be provided for visitors from a distance.

British Association.—The eighty-seventh annual meeting of the British Association will be held in Bournemouth from Tuesday, September 9, to Saturday, September 13, under the presidency of the Hon. Sir Charles Parsons, who will deliver an address to the association (dealing with engineering and the war) at the inaugural general meeting in the Winter Gardens on September 9, at 8.30 p.m. The sectional work will begin on Tuesday morning, and the days available for sectional meetings will therefore be

Tuesday, Wednesday, Thursday, and Friday, September 9, 10, 11, and 12, and, if required, Saturday morning, September 13. The presidents of sections include: Physiology, Prof. D. Noel Paton; Botany, Sir Daniel Morris; and Agriculture, Prof. W. Somerville.

The National Gladiolus Society.—The result of the circular sent out by direction of the Committee of the National Gladiolus Society shows 17 votes for winding up the Society and 2 votes against. These figures do not include any member of the Committee. Several members expressed their regret that the only course open was the winding up of the Society, and agreed that the balance of the Society's funds should be handed to the St. Dunstan's Home for Blinded Soldiers. A general meeting of the Society will, therefore, be held at Messrs. Barr and Sons, 11, King Street, Covent Garden, London, W.C., on Tuesday, the 29th inst., at 12 noon:—(1) To receive the result of the circular directed to be issued at the last committee meeting. (2) To consider, and, if necessary, to pass the following resolutions:—(a) That the Society be and is hereby dissolved; (b) that the Chairman and Hon. Treasurer be authorised to receive all books and assets of the Society with the object of their realisation and disposal; and (c) that after payment of the expenses of and incident to this meeting, the balance remaining in their hands be paid over to the Treasurer of the St. Dunstan's Home for Blinded Soldiers. (3) To transact any other business which may be necessary.

Paris Spring Show.—In a short, chatty letter from a young French gardener, we learn that the Paris Show held last month (see *Gard. Chron.*, June 21, 1919, p. 310) was somewhat hampered by the tramway, tube and omnibus strike. Messrs. Dobbie's Sweet Peas were greatly admired, he tells us, for this flower is not so well known in France as in this country. Of Roses there were some English varieties which were highly appreciated, particularly Golden Emblem, Duchess of Sutherland, Mrs. C. Russell, and Mrs. Wemyss Quin. Hydrangeas from M. Cayeux, M. Decault, and M. Mouillère were in good form. Orchids occupied a minor position, but Rhododendrons were very attractive, and considering there have been five years of war when such things could not have the usual attention, they were much admired.

Early Potatos.—The drought during May, which was more or less general throughout England, did not have such an adverse effect on the yields of early Potatos in Cornwall as was at one time expected. The chief varieties grown were May Queen and Sharp's Express, with a few Duke of York in the Penzance district. The crops, though not providing large yields, have generally given satisfaction to the growers. Ninety-fold and Epicure raised in Cheshire, Lancashire, and Scotland have yielded only fair crops, but they were marketed in excellent condition. This season, first early varieties immune from wart disease were more extensively planted than in previous years, and highly satisfactory crops of Snowdrop, Witch Hill, and Edzell Blue have been raised. The last variety carried rather a large haulm for a first early. Another immune first early variety which, according to the Board of Agriculture, has yielded satisfactory crops, is Dargill Early; it is a new seedling with foliage of the Ashleaf type, and tubers that are yellow in flesh and of good quality.

New Roses at the N.R.S. Show.—We learn that the new Rose named Independence Day, described on p. 15, received a Certificate of Merit from the National Rose Society last year (see *Gardeners' Chronicle*, July 13, 1918, p. 18), and not on the 2nd inst.; but the variety Evelyn Thornton (see p. 15), also shown by Messrs. BEES, obtained this award on the latter date. We suggest that it would make for correctness and assist the Press generally if the cards notifying the awards to new Roses were placed in front of the successful varieties at a much earlier hour than 4 p.m. A pencilled note on the entry card is not consistent with the dignity of the Society, and hardly fair to the exhibitors or the visitors. The two varieties which were awarded Gold Medals are illustrated in Figs. 13 and 14.

The Genetical Society.—A well-attended and representative meeting was held on June 25 at the rooms of the Linnean Society, for the purpose of founding a society to promote the study of Genetics. The object of the new organisation was declared to be the promotion of intercourse between persons interested in the various branches of genetics, whether scientific or economic. The meetings are to be held in the various places where experimental work is in progress, and the hope was expressed that visits to practical breeders of plants and animals may be also arranged. It was announced that the Rt. Hon. A. J. Balfour, whose interest in this branch of science is well known, had consented to become the first president of the society. The following were also appointed: Vice-presidents, Mr. W. Bateson, Miss E. K. Saunders, Mr. A. W. Sutton; secretaries, Prof. Punnet, Miss C. Pellew; committee, Mr. W. E. Agar, Prof. Biffen, Prof. Bourne, Mr. E. A. Bunyard, Mr. L. Doncaster, Sir A. D. Hall, Mr. A. W. Hill, Dr. Keeble, Prof. A. H. Trow. In view of the difficulty of accommodating large numbers at some of the institutions to be visited, the membership was limited to 100. The first scientific meeting is to be held in Cambridge on the 12th inst.

Budding Wild Olives.—Wild Olives abound in certain parts of Baluchistan at heights of about 5,000 feet above sea level, and in the hope of turning this to profitable use the Forest Administration of the country has, according to a note in the *Journal of the Society of Arts* (June 6, 1919), carried out experiments in budding on the wild trees the European Olive. It has been found that resting buds put in September on trees previously cut down and

coppiced take well. It is hoped if the experiment is successful to establish an oil industry in Baluchistan.

Agricultural Workers' Cottages.—According to the *Wages Board Gazette*, under Clause 5 (b) of the "Benefits and Advantages" Order, it is open to a worker occupying a cottage provided by his employer in part payment of minimum rates of wages in lieu of payment in cash to complain to the District Wages Committee for his area if he considers that the cottage is defective in accommodation, sanitation or water supply, or is in want of repair, and ask them to fix the sum which may be deducted from his wages on account of the provision of the cottage at less than the maximum sum allowable under the Order. The maximum sum which may be deducted from the minimum wage in respect of a cottage free from the above-mentioned defects is 3s. for all counties in England and Wales, except Northamptonshire, Herefordshire, Mid-Bucks, and parts of Somerset, where the sum is 2s. 6d., and North Bucks, where it is 2s. The number of complaints as to defective cottages so far reported by District Wages Committees has not been large, and from many districts no complaint has been reported. Private gardens or estates are not held by the Board to come within the scope of its Orders, except where the produce thereof is grown wholly or partly for sale. But in the latter cases the Board hold the view that the minimum rates of their fixing apply, and must be paid.

Potato and Fruit Growing in Ireland.—From 1916 to 1918 the total acreage under Potatos in Ireland increased by 115,539 acres, or 19.7 per cent., the areas under cultivation being—1916, 586,308; 1917, 709,263; 1918, 701,847. It will be seen that from 1917 to 1918 the acreage decreased by 7,416 acres, or 1.0 per cent. There was a decrease of 9,563 acres in Munster, 5,474 acres in Leinster, but the area in Connaught increased by 4,856 acres, and in Ulster by 2,765 acres. Antrim showed an increase of 2,356 acres, Galway 1,840 acres, Londonderry 1,742 acres, Roscommon 1,655 acres, and Mayo 1,500 acres, while, on the other hand, the area decreased in Cork by 4,965 acres, in Kerry by 2,809 acres, in Westmeath by 1,265 acres, and in Kilkenny by 1,262 acres. The area under fruit increased from 15,567 acres in 1916 to 17,024 acres in 1917, and to 18,503 acres in 1918. The total increase from 1916 to 1918 was 2,936 acres, or 18.9 per cent. The area in Ulster increased by 1,900 acres, in Leinster by 625 acres, in Munster by 289 acres, and in Connaught by 122 acres. Armagh showed an increase of 601 acres. Down, Antrim, Tyrone and Fermanagh, each showed an increase of over 200 acres. The total area increased by 1,479 acres, or 8.7 per cent. from 1917 to 1918. The area in Ulster increased by 752 acres, in Leinster by 348 acres, in Munster by 287 acres, and in Connaught by 92 acres. Antrim, Down, Tyrone, Tipperary, and Londonderry, each showed an increase of over 100 acres.

Eelworm.—Of the innumerable pests which attack cultivated plants Eelworm is one of the most serious, particularly because owing to their millions the evil which they do is often ascribed to "cultural defects." Like most soil pests Eelworms are by no means easy of extermination. When distributed generally through a soil they can only be got rid of completely—so far as is known at present—by a thorough sterilisation of the soil, which is a difficult operation, and one which, so far as soils in the open are concerned, is well-nigh impracticable. Where, however, as occurs in certain cases, Eelworm is carried in the seed, remedial measures are both practicable and successful. Thus, in a recent paper on the subject of Eelworm in Wheat,* Mr. Byars shows that the "cockled" grains which are infected by Eelworm may be separated from sound grains by the salt brine method devised by Dr. A. G. Johnson, of Wisconsin, for removing ergot from Rye. To apply this method a 20 per cent. solution of salt is made by dissolving 40 pounds of common salt in 25 gallons of water. When a sample of Wheat is poured slowly into this solution the sound grains sink, whereas the grains infected with the nematodes float and hence may be skimmed off. When this has been done the salt solution is drained away and may be used again. The sound Wheat is rinsed with water and then spread on the floor on canvas till it is dry, when it is ready for planting. To rid soil of this pest it is necessary to refrain from growing Wheat on it for two or three years, for the Wheat Eelworm does not seriously attack other crops, and hence is starved out if its host plant is not present.

* *The Eelworm Disease of Wheat and its Control.* By L. P. Byars. Farmers' Bull. 1,041, U.S. Dept. of Agric. March, 1919.

Land Settlement for Ex-Service Men and Other Small Holders.—Fifty-two County Councils report to the Board of Agriculture a total of about 20,000 recent applications for small holdings by ex-Service men and others. Between 7,000 and 8,000 of these applicants have been interviewed by the committees of the counties; and 79 per cent. of them have been approved as suitable persons to have small holdings under the local authorities. Enquiries made some time ago among the armies in France suggested that most of the Service applicants for small holdings would require only a cottage and an acre or so of land. The actual applications to date do not confirm this earlier impression. Of 5,824 men interviewed by the County Committees, 5,436 have applied for a total of 106,377½ acres; whilst 388 only asked for cottage holdings, the total area affected by their applications only just exceeding 1,600 acres. During the last week in June the Board of Agriculture approved the purchase of nearly 4,000 additional acres by local authorities for small holding purposes. The counties concerned were Buckinghamshire, Bedfordshire, Cambridge, Cheshire, Cornwall, Derby, Devon, Gloucester, Kent, Lindsey (Lincs.), Somerset, Southampton (Hants.), Stafford, Suffolk, Sussex, Warwick, Wiltshire, Anglesey, Denbigh, Flint, and Glamorgan. It will be gathered from this list of a single week's schemes approved that the interest taken by local authorities in the provision of land for ex-Service men is genuine and widespread. Since the beginning of the year County Councils acting under the Small Holdings and Allotment Act have bought for this purpose, with the approval of the Board of Agriculture, close on 37,000 acres—34,043 acres in England and 2,938 acres in Wales. Possession so far has only been obtained of about one-seventh of this area, but by the end of the year the authorities will be holding for ex-Service men nearly half of the land bought. It should be added that the Board of Agriculture and the local authorities meanwhile are co-operating to train the future small holders or to find them suitable employment, and that the councils are arranging with the Board for the purchase of over 100,000 more acres, including upwards of 9,000 acres to be acquired if necessary by the exercise of compulsory powers. It is evident that where land has been unobtainable by amicable negotiation local authorities have not hesitated to ask for powers of compulsory purchase.

War Items.—M. Louis Lemoine, an officer in the 160th Regiment of the line, and son of M. Lemoine, the well-known nurseryman, of Nancy, has been mentioned four times in Orders. M. Louis Lemoine has been three times wounded and has been awarded the Cross of Chevalier of the Legion of Honour. M. Henri Lemoine, another son, who served in the artillery, has also been mentioned in Army Orders.

——News has only just reached us of the death in 1917 of Prince Gargarine, which took place at Odessa. This gentleman was a great patron of horticulture and was well known for his interest in pomology. He often took part in International Shows, and was one of the Foreign Members of Honour of the International Horticultural Exhibition held at Chelsea in 1912.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

R.H.S. War Relief Fête.—I am desired by the President and Council of the Royal Horticultural Society to communicate, through the courtesy of your columns, to all the members of the horticultural trade who supported the Society's War Relief Fund Fête, the Council's sincerest thanks for the whole-hearted response made to their call for help and co-operation, and for thus rallying round the Society to increase its fund for the restoration of devastated orchards and gardens in the countries of our Allies. It is anticipated that a very considerable sum of money will be added as a result of this effort. The amount secured will be made known as soon as possible. *W. Wilks, Secretary, Royal Horticultural Society.*

Jaborosa integrifolia (see p. 5).—I was interested in Mr. Arnott's note on this plant. It deserves all the praise he gives it, even when judged by only a few flowers. For some eight or nine years I had a good patch of the plant growing in a border in sharply-sloping, well-drained ground, in a sunny situation. Each year one could confidently look forward to a dozen or more of its beautiful white, sweet scented flowers. The plant received little attention beyond keeping other stronger growing subjects from encroaching upon it. This spring, however, after a few years' absence from home, I found it had disappeared, having probably succumbed during the severe winter of 1916-17. Judging by my experience I should say that in the warmer parts of the country the cultivation of this plant should not offer many difficulties. Our soil is limy, and possibly the addition of lime in some form to a soil lacking in this constituent might be helpful. *J. D. Halliburton, Royal Victoria Park, Bath.*

Chamois-coloured Mole. In a field adjoining the gardens here a mole was captured recently, with fur of a buff or chamois colour. It was kept a few days in captivity and was fed liberally with earthworms and various other things, including wood lice, which are, apparently, especially relished by the little animal. This coloured mole is a voracious eater and fierce worker, burrowing about in its caged dump for two or three hours at a time, then resting or sleeping for a similar length of time. It would be interesting to know if any of your readeres have ever seen a mole of a similar colour, or whether moles change colour naturally at certain seasons of the year as do certain other little quadrupeds. *R. Davidson, Kingswood Manor Lodge, Reigate.*

Variability in Plants.—If we assume that the genus we now define as Fuchsia originated from some previous ancestor that was not a Fuchsia, it must have inherited units in its composition which one would expect might revert at times to what would not be a Fuchsia, nor any other existing genus. That is what I would assume if intravolution admits of such a range of variation in the primitive plant constitution as Mr. E. Judson Page (p. 10) would seem to imply. A vast number of genera hinge on very small differences, and they (the genera) would break down if the parts of a flower were to vary even to a small extent. Mere size of a flower would not alter the generic characters; but the pulpy fruit is the chief thing that separates Fuchsia from Oenothera, and one may assume that some previous ancestor of the Fuchsia had no pulpy fruit. In Clarkia the tube of the calyx is not produced above the ovary, whereas in Eucharidium it is, the other characters being the same in both. In his book he mentions Mr. Page assumed the permanence of the composite creative principle in genus or species, therefore the calyx of Eucharidium may be regarded as generic and immutable. In a previous note I mentioned a Begonia with a superior ovary and open carpels. The ovary in the double-flowered Prunus Cerasus has reverted to an open green leaf. These reversions go behind the genus and the Order. I have seen no yellow Fuchsia, but F. procumbens has no petals, while the tube of the calyx is yellowish and the free portions pale blue. Several species have scarlet flowers. If white

is a primitive to all the spectroscopic colours, it is remarkable that no pure white Fuchsia has yet been produced. Venus Victrix and Countess of Aberdeen are the nearest to white I have seen, but they have a considerable amount of colour. *J. F.*

The Garden Chafer (see Vol. LXV. p. 321).—So far this year I have heard no complaints about this insect, except from the districts of Surrey mentioned by the correspondents in two previous issues. It has been recorded by Curtis as having been a plague in various parts of England in 1814, 1832, 1833, 1839, 1840, and 1844. Since 1892 it has been frequent, but judging by the records it will disappear after some years in Surrey, or become reduced to very moderate numbers. I have records that it eats the fruit as well as the leaves of Apples and Cherries. It also attacks Plums, Pears, Nuts, Roses, Strawberries, Nectarines, Cabbages, Rose roots, and Pine roots. Various names have been given to it in different parts of the country, such as Bracken Clock, Button Fly (Wales), and May Bug. As the beetles appear during May and June, the latter name would be more appropriate than June Bug, which would be more applicable to that other member of the group, the Summer Chafer, which is on the wing from the middle of June to the middle of July. This chafer has been abundant in the London district from 1839, or earlier, till 1919, but is not half so numerous in my district as last year, and is comparatively harmless. *Q.*

TREES AND SHRUBS.

CISTUS.

THOSE who wish to furnish a sunny bank with bold masses of flowering shrubs will find nothing better for the purpose than the sun-loving Cistuses. Generally the natural soil of such a place is quite suitable for the requirements of the plants. Rich soil of any kind should not be added, for this would favour the development of soft growth which would neither withstand winter weather nor produce the abundant blossom which is the plant's chief charm—it is the sturdy, short-jointed, almost starveling, that gives the best display. But if the natural soil is unusually poor the addition of leaf-mould is to be recommended, as this will assist the plants to become established. While a maximum amount of sunshine and a relatively dry root-run are desirable, if not actually essential, atmospheric moisture is no detriment to the well-being of these South European shrubs, and some of the best plants of the older sorts that I have seen were growing on the rather steep sides of a stream which fed a large lake. Although 30 years have come and gone since I first saw generous masses of C. ladaniferus growing in such a place, I still retain vivid recollections of the charm of the countless numbers of widely expanded flowers, in which the white was relieved by five regular, chocolate-coloured blotches. But beautiful as this old species is, it must take second place to C. Loretii (see Fig. 11), which grows more regularly and gives freely of its dazzling, pure white flowers, each of which has the characteristic blotch at the base of the petals, but, in this case, of almost blood red colour, though I fancy an artist would describe the tone as crimson lake. A bold group recently planted in Kew Gardens on the Richmond side of the mound where the giant flagpole is soon to be erected, was very beautiful during the broiling days in June, but, all being well, this group will be even more wonderfully beautiful in three or four years time.

Although, at the moment, the show of bloom is but scanty, yet most species, revived by the grateful rains, have abundant flower buds which only await the beneficent sun we all feel confident will soon again shine, and then this group of C. Loretii and the many charming sorts in the general collection near by will be well worth a special journey to see.

I often wonder that rock gardening enthusiasts have not made more use of the dwarfer, spreading kinds, which, if planted midway on the ledges, would make charming features. For this purpose C. albidus, which has greyish leaves and rosy lilac flowers, is to be recommended; also C. crispus, of satiny rose colour; the white C. florentinus and C. monspeliensis. Taller Cistuses of merit are C. laurifolius, probably the hardiest of all and a shrub that makes a very uncommon informal hedge; C. salvifolius, which bears plenty of red flowers; C. villosus, rose coloured; C. cyprius, white, with brilliant red blotches; and the wonderful purple-red C. purpureus. There are many beautiful varieties, including Silver Pink, which received the R.H.S. Award of Merit on June 17 last.

The chief fault these plants have is their unsuitability for transplanting; therefore it is necessary to keep young plants in pots until they are placed in their permanent positions, but this is a comparatively small matter. *C. Aubrey.*

PHILADELPHUS.

GARDENS old and new owe much to this genus. In New England gardens of more than a century ago it was one of the chief ornaments and with the Lilac and a few old-fashioned Roses, the Syringa or Mock Orange (Philadelphus coronarius), was loved and carefully tended; and in modern gardens there are few plants which produce more delightful flowers than some of the newer varieties of Philadelphus. According to the *Bulletin* of the Arnold Arboretum there are now established in the Arboretum some thirty species of Philadelphus and a large number of varieties and hybrids. All these plants, popularly called Syringas, are easy to manage, demand no special care, and suffer less from the attacks of insects than most trees and shrubs. They flower freely year after year, their flowers are often very fragrant, and in rich, well-drained soil the plants live for a long time. Some of the species can grow under the shade of overhanging trees, and flower in such situations more freely than almost any other shrub. The beauty of these plants is found in their white flowers; the fruit, which is a dry capsule, has as little beauty as that of a Lilac; there is nothing distinct or particularly interesting in the habit of the plants of any of the species, and the leaves fall in autumn without brilliant colouring. As flowering plants not many shrubs, however, surpass them in beauty,

FIG. 12.—PHILADELPHUS CORONARIUS "BOULE D' ARGENT."

and their value is increased by the length of the flowering season which extends in the Arboretum during fully six weeks.

The first Philadelphus to flower in the Arboretum opened its flowers in early June: it is from Korea (P. Schenkii var. Jackii), and is a tall, narrow shrub with erect stems and flowers of medium size, but of no exceptional value as an ornamental plant. Almost as early to flower is P. hirsutus from the southern Appalachian Mountain region. This is one of the smallest flowered species and in the Arboretum is a large, loose-growing shrubs of unattractive habit, and of comparatively little value as a garden plant. It is to be regretted that the Syringa of old gardens (P. coronarius) has been pushed

aside by newer introductions, and has become comparatively rare in at least this part of the country, for the flowers of no other Syringa have a more delicate and delightful perfume. This plant, which is a native of western Europe, reached England before the end of the sixteenth century, and was probably one of the first shrubs which the English emigrants brought with them to this country.

Among the American species which should find a place in all gardens are P. inodorus, P. pubescens and P. microphyllus. The first is a native of the Appalachian Mountain region, and grows to the height of six feet; it has arching branches and large, solitary, pure white, cup-shaped, scentless flowers. By some persons it is considered the most beautiful of all Syringas. P. pubescens, often called P. grandiflorus or P. latifolius, is also a plant of the southern Appalachian region. It often grows to the height of twenty feet; the branches are stout and erect, the leaves are broad, and the slightly fragrant flowers are arranged in erect, from five-to ten-flowered racemes. This plant is more common in gardens than the last, and when it is in bloom it makes a great show. P. microphyllus, which rarely grows more than three feet tall, has slender stems, and leaves and flowers smaller than those of any Philadelphus in cultivation. What the flowers lack in size, however, is made up in fragrance which is stronger than that of any other Syringa and perfumes the air for a long distance.

The most distinct and the handsomest of the Asiatic species in the Arboretum is Philadelphus purpurascens, discovered by Wilson in western China. It is a large shrub with long arching stems from which rise numerous branchlets from four to six inches long and spreading at right angles; on these branchlets the flowers are borne on drooping stalks; they are an inch and a half long, with a bright purple calyx and pure white petals which do not spread as they do on most of the species, but form a bell-shaped corolla and are exceedingly fragrant. This is one of the handsomest of the shrubs brought from western China to the Arboretum. Philadelphus pekinensis from northern China and Mongolia is a stout bush rather broader than high which every year produces great quantities of small flowers tinged with yellow. Another interesting garden plant, P. Falconeri, which is certainly Asiatic and probably Japanese, has narrow lanceolate leaves and fragrant flowers in from one-to six-flowered racemes, and is distinct in the shape of its leaves and in its long narrow petals. The origin and history of this plant is not known.

FIG. 13.—ROSE: MRS. C. V. HOWARTH; COLOUR, ORANGE-SALMON, FLUSHED WITH PINK.
National Rose Society's Gold Medal, July 2, 1919 (see p. 25).

Some of the species hybridise freely and several of the handsomest of these plants are hybrids. One of the first of these hybrids to attract attention was raised in France before 1870 by Monsieur A. Billard; it is known as Philadelphus insignis and sometimes is called Souvenir de Billard. It is one of the handsomest of the large-growing Syringas, and the last or nearly the last to bloom in the Arboretum, for the flowers will not be open for another month. A hybrid probably between P. grandiflorus of the Appalachian Mountain region with a species from our north-west coast appeared in the Arboretum a few years ago, and has been named P. splendens; it is a large and vigorous shrub with unusually large flowers, and one of the handsomest Syringas in the collection. Philadelphus maximus, a supposed hybrid between P. latifolius from the south-eastern United States, and P. tomentosus from the Himalayas, grows to a larger size than any of the other Syringas. It is not rare in old Massachusetts gardens in which plants from twenty to thirty feet high can occasionally be seen.

The crossing about thirty years ago, in France, by Lemoine, of P. coronarius with P. microphyllus has produced an entirely new race of Syringas which has proved to be one of the best additions to garden shrubs that has ever been made. The first plant obtained by this cross is called Philadelphus Lemoinei; it is a perfectly hardy shrub four or five feet high and broad, with slender stems which bend from the weight of countless flowers; these are intermediate in size between those of the two parents and retain the fragrance of P. microphyllus. There are at least a dozen distinct forms of this hybrid made by Lemoine, varying considerably in the size of the plants and of the flowers, and in the time of flowering. One of the handsomest, perhaps, is called Candélabre; this is a very dwarf plant with flowers larger than those of either of its parents and an inch and a half wide, with petals notched on the margins, and without the perfume of its parents. Other distinct forms equally hardy and beautiful are Avalanche, Boule d'Argent (see Fig. 12), Bouquet Blanc, Erectus, Fantasie, Gerbe de Neige and Mont Blanc.

NOTES FROM IRELAND.

Miss FITZGERALD, Principal of the Ladies' School of Gardening, St. Gatien's, Rathfarnham, has arranged to give practical demonstrations in gardening, under the auspices of the Terenure and Districts Horticultural Society, in her picturesque grounds on the fringe of the Milesian Metropolis at the foot of the Dublin mountain range. The School of Gardening was established by Miss FitzGerald shortly after war broke out, when she and her family, who had been settled in Antwerp for eighteen years, had three hours' notice from the Germans to quit.

Arrangements have been made and the schedule issued for a three days' show of the Royal Horticultural Society of Ireland, in conjunction with the Royal Dublin Society's Horse Show, the last week in August, at the latter's commodious premises, Ballsbridge, Dublin. These premises, up to the spring, were in possession of the military as the Remount Department. Dublin's Horse Show invariably attracts many thousands of visitors, and every effort is being made for the horticultural section to be worthy of the popular function.

In spite of chilling north winds and low temperature prevailing over the premier county since mid-June, crops generally look well, and Potatos particularly so. Most of the mid-season and late Potatos are in luxuriant bloom, and Dublin is now being fairly well supplied with early tubers, retailed at 2d. per lb. Good quality Strawberries ranged about 1s. 6d. per lb., with very limited supplies, for Dublin practically depends on Strawberries from Hampshire and Kent after the few consignments of early berries from Cork are over.

The beds and borders in the Phoenix Park are again cropped with vegetables, but the public has little to cavil at, for the picturesque undulating expanse with its ample shrubberies, fine stretches of greensward, and generally interesting plantings, are very pleasing features of the park.

Plotholders' work around Dublin is at present particularly pleasing, notably along the valley of the Liffey from the city on to Chapelizod. The spring-sown Onion crop is most promising, but autumn-sown Onions of all varieties have shown an abnormal tendency for flowering prematurely. Of some hundreds of plots under notice, not one, nor even a single plant, appears free of this tendency to premature flowering. A plot-holder beat the professional growers in the class for Onions at the recent Dublin Show. *K., Dublin.*

FLORISTS' FLOWERS.

FUCHSIAS FOR GREENHOUSE ROOFS.

Very frequently one finds roofs of greenhouses furnished with strong-growing climbers, which deprive the plants underneath of the necessary amount of sunlight. This is especially the case when such plants as Cobaea scandens, Passifloras and Tacsonicas are employed in a comparatively small structure. Many of the Fuchsias, if trained openly, do not shut out much light, and during the winter they are bare of foliage. The drooping character of the blossoms enables them to be seen to very great advantage when viewed from below. The fact that the plants will continue to flower throughout the entire summer is another great point in their favour. Many years ago there was a large plant of the variety Alexandra in No. 4 greenhouse at Kew. It furnished a considerable space of roof, and formed a canopy of leaves and blossoms. This variety has, or perhaps I should say had, a white corolla, for I am not sure of it being in cultivation nowadays.

In treating Fuchsias in this manner they may, when the allotted space is covered, be pruned back to the old wood each winter. Messrs. James Veitch and Sons showed, at the International Horticultural Exhibition of 1912, the value of Fuchsias when grown as cordons for furnishing the rafters of a greenhouse, but the plants are, at least in my opinion, even more effective when a part of the roof is covered. In selecting varieties for this purpose it should be borne in mind that the somewhat loose-habited varieties are preferable to those of stiff, compact growth. A few good sorts are Charming (red tube and sepals and purple corolla), Elegance (of much the same colour), Flocon de Neige (white corolla), General Roberts (rosy tube and sepals, carmine purple corolla), Mrs. Marshall (white flower, with rosy scarlet corolla), Mrs. Rundle (tube and sepals pale flesh-colour, salmon-red corolla), Olympia (salmon-pink flowers, with carmine-scarlet corolla), and The Shah (bright red flowers, corolla violet blue). Besides their use as roof plants, Fuchsias may be regarded as general utility subjects, as the purposes for which they may be employed in the garden, both indoors and out, are many. *W. T.*

MR. REGINALD FARRER'S SECOND EXPLORATION IN CHINA.

No. 3.—Round Hpimaw.

The valley head of which I write is about 6,000 feet up. The fort sits on the hill above at some 7,800 feet. For such a latitude such a height should not necessarily convey any sure promise of hardiness in England. Yet even setting aside the notorious paradoxical uncertainty of plants, the peculiar climatic conditions of these parts give the strongest hopes for any parts of Great Britain that are not parched nor torrid. Hpimaw Hill gets a very cold winter, with snow lying for a week at a time; even in the valley below, though Rice is widely grown in the widening of the vale, the seed that is sown in April is said not to reach maturity till October. Meanwhile, in May comes the year's one burst of amiability; and in June the rains break, and rain, and rain, and rain, in an almost uninterrupted succession of fog and gloom and deluges, until October comes round, and the fine clear weather of autumn and winter. And such a climate, so tempered in warmth, so excessively luxuriant in cloud and wet, ought to give most of its plants a much more kindred feeling for the wet and clouds of many parts of Great Britain than could fairly be hoped from very much more northerly species even, such as hail from the torrid, sun-beaten river cañone of Kansu, the Saharan heats of the Blackwater, and the droughtiness of Tien Tang Ssû.

There are Chinese and Lissu villages or settlements at the base of the hill, and the local affluents of the Ngaw Chang (left, bending northward, and a few miles below) flow down beneath the slopes and wooded chines of the hill through dense banks of coppice, more homely looking than any yet seen, with Willow and Alder and Poplar, and many another old friend, including wild Plums and Cherries, and Peaches which, if not wild, have come to look so, among the rest of the copse. Neillia is here, too, and Leycesteria, and a Vaccinium of the proportions of a small tree, densely hung with blossom. And the local Bamboo is no longer Bambusa polymorpha, of the tropical jungles, nor even B. palmata of the passes. This, indeed, persists here in the highwoods, while a smaller cousin covers the high tops in a brown mantle, which looks encouragingly like bare moorland till field glasses have detected its real covering. But the prevailing Bamboo of the copses and gullies is a graceful feathery thing, not, indeed, with the incomparable grace of A. nitida, but still plumy and desirable. The Htawgaw Rhododendron, too, comes here to its own, and there is a beautiful purpurascent Deutzia so dense in blossom that one day from across the torrent it made me suspect it of being bending sprays of crimson tubes and long boughs of oval-pointed evergreen leaves in pairs. And there is also Mistleto, swinging aloft in great golden-green balls from the summit branches of the spindly tall Magnolias.

Down by the stream-bed Lilium giganteum is unfolding, and a little creamy Tiarella lights up the darkness under the rocks, while a vividly lilac-purple Cress flares among the boulders. Out in the open there are flatter spaces, burnt for cultivation. Here, in a marsh, a sibicoid Iris is coming up, while in another, that fills a dell, the whole expanse is brilliantly green with the spear-blades of a flag Iris. And on the black slopes fascinating little rosy Coelogyne is emerging, straight from the bare soil, on a scape of three inches, in such a way as to make one realise how and why it is that these have been so justly called the Indian Crocus. The chief of the Rhododendrons here is not yet in flower, but two very distinct large-leaved ones hang from the darker

Fig. 14.—Rose Miriam; a new H.T. variety : colour deep salmon-pink with a yellow glow.
National Rose Society's Gold Medal, July 2, 1919 (see p. 25).

some unusually floriferous Lilac. On the big black boulders are enormous colonies of Polypody, Solomon's Seal, Dendrobiums of different sorts, and a most curious Vaccinioid shrubling, which forms heavy masses alike on trees and on rocks, and, not content with emitting tubular crimson flowers has the tips of its young shoots so flaringly crimson, too, that even its blossoms seem dull by comparison, lurking among the ovate evergreen foliage of dark lucent green. Of this tree is also another but rarer species, which weeps from tree-boughs higher up, among the rain-engendered lichen, in long nummularioid sprays of smaller, rounder, finer leaves, with the same tubular red flowers. There are other brilliant parasites, too: one which affects Rhododendron and Cotoneaster and others, forming wide bushy Witches' Brooms, all lit up along the sprays with vivid orange-red blossoms dimly suggesting Honeysuckle; and yet another, with axillary cliffs above the beck, and give promise of bloom later on. In one of these we may suspect Ward's R. agapetum, unless this be either of two other tree-Rhododendrons, now fat in bud, one of which has the bracts on the glandular young leaf-shoots of so brilliant a red as themselves to suggest blossoms, while in the other the shoots and bracts and buds are all pale green. But two first-class beauties are now actually in bloom. One is a very near relation of R. bullatum,* with characteristic crinkled thick foliage, clothed on the reverse in a fawn-coloured felt. The flowers, two or three in the loose head, are very large (with large crimson sepals, broader than they are long), pure white but for an external blush of rose, and a basal stain of yellow—and of the most inebriately sweet fragrance. This lovely plant occurs either as a parasitic or terrestrial

* Rhododendron sp. F 842.

growth, often appearing as a blossoming trailer far up on the trunk of some giant tree. It seems, also, to flower in alternate years, to judge by the rarity of recent seed vessels (which open in six valves) on blooming bushes, and of bloom on seeding ones. The other* is even, to my mind, almost more beautiful, and has the romance of having hitherto only once been sighted as a single specimen, that nearly escaped the collecting tin, owing to my orderly's assertion (he did not want to cross the stream again, and climb a coppiced bluff) that it was the same as the last. On the contrary, it is very different—an erect, rather thin, tall bush, with thin, smooth, pointed leaves, most curiously fitted microscopically with brown on their glaucous reverse. The flowers are very large, pure white, with a golden stain in the throat, and as entrancingly sweet as those of the last, but in a different way, rather with the keen fragrance of Orange-blossom than with the heavy exotic deliciousness of the other scented, white Rhododendrons. Though I do not readily believe in the existence of unique specimens, I must confess that I have subsequently searched all other likely-looking spots hereabouts without as yet coming on any second sample of this precious species, very distinct as it appears to be. But this country is so vast, its heights and depths and distances so incalculable, its coppices such impenetrable forests when you get to them, that he would be a very rash man who would claim to have made an exhaustive search after any given species. Suffice it then for the present to say only that, up to date, our one solitary hope of seed from this remarkable beauty depends on one solitary specimen, already rather too lavishly deflowered by the enthusiasm of the Gurkha. Nor can these Azaleoid Rhododendrons be by any means always relied on for copious seed, unlike most other groups in the race. *Reginald Farrer.*

SOCIETIES.

NATIONAL SWEET PEA.

At the close of the National Sweet Pea Society's Floral Meeting (see p. 12) on July 1, about fifty members dined together at the Holborn Restaurant, under the chairmanship of the President, Mr. E. W. King. Many of the prominent raisers and successful exhibitors were present, and Mr. and Mrs. Bedford, from Cape Town, were guests. There were very few speeches, but a capital programme of music was arranged by the Entertainment Committee, Messrs. Bridgford, Christy and Curtis. The usual loyal toasts were followed by "The National Sweet Pea Society," proposed by Mr. C. H. Curtis, formerly Hon. Sec., who reviewed the work of the Society since its institution in 1902, and gave very many interesting historical facts in connection with the Bicentenary Celebration of the Introduction of the Sweet Pea, from which the Society sprang. This was responded to by Mr. J. S. Brunton, Chairman of the Committee. The President presented the trophies and cups to the prize winners, and was, in turn, presented with the Burpee Cup by Mr. Thomas Stevenson, a former winner of this handsome piece of plate. Other toasts given and honoured were "The President," "The Secretary," "The Ladies" (to which Mrs. Curtis responded), and "The Chairman of Committee." In connection with this last toast, Mr. Brunton was presented with the Society's Gold Medal as a recognition of services rendered as Editor of the *Sweet Pea Year Book.* A very enjoyable evening concluded with "Auld Lang Syne."

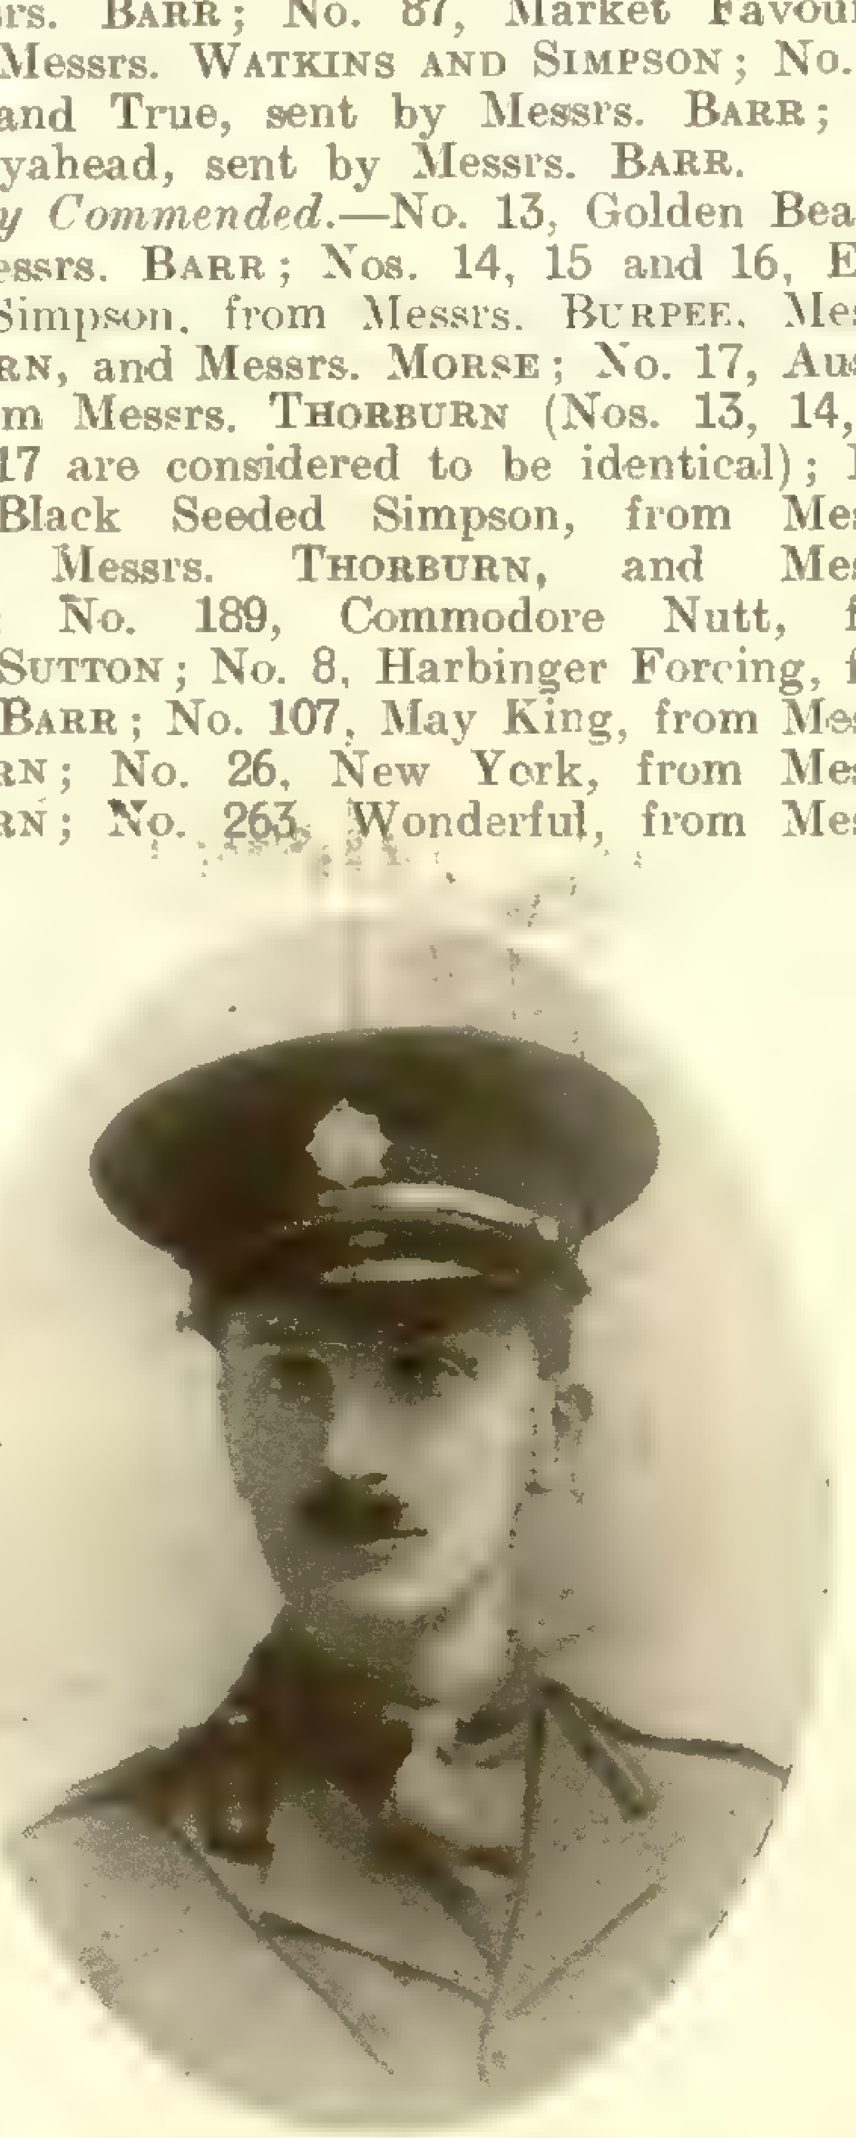
R.H.S. TRIALS AT WISLEY.

Very large trials of Lettuces have been conducted by the Royal Horticultural Society at its Gardens at Wisley, during the present season. These have been inspected by the Fruit and Vegetable Committee on several occasions, and the following Awards have been made :—

LETTUCES.

Award of Merit.—No. 156, All the Year Round, from Messrs. SUTTON, Reading; Nos. 70, 267, Continuity, from Messrs. MORSE and Messrs. NUTTING; No. 76, Sutton's Satisfaction, from Messrs. SUTTON (Nos. 70, 267 and 76 are considered to be identical); No. 12, Georges, sent by Messrs. BARR; No. 87, Market Favourite, sent by Messrs. WATKINS AND SIMPSON; No. 21, Tender and True, sent by Messrs. BARR; No. 121, Wayahead, sent by Messrs. BARR.

Highly Commended.—No. 13, Golden Beauty, from Messrs. BARR; Nos. 14, 15 and 16, Early Curled Simpson, from Messrs. BURPEE, Messrs. THORBURN, and Messrs. MORSE; No. 17, Australian, from Messrs. THORBURN (Nos. 13, 14, 15, 16 and 17 are considered to be identical); Nos. 18-20, Black Seeded Simpson, from Messrs. MORSE, Messrs. THORBURN, and Messrs. BURPEE; No. 189, Commodore Nutt, from Messrs. SUTTON; No. 8, Harbinger Forcing, from Messrs. BARR; No. 107, May King, from Messrs. THORBURN; No. 26, New York, from Messrs. THORBURN; No. 263, Wonderful, from Messrs. NUTTING (Nos. 26 and 263 are considered to be identical).



THE LATE LIEUT. E. R. RIDES.

PAEONIES.

The following Awards have been made to Herbaceous Paeonies by the Council of the Royal Horticultural Society, after trial at Wisley :—

First Class Certificate.—No. 136, Lady Carrington, from Messrs. BATH.

Award of Merit.—No. 84, Devonia, from Messrs. R. VEITCH; No. 96, Solfaterre, from Messrs. BATH.

Highly Commended.—No. 108, Maria Kelway, from Messrs. KELWAY.

Obituary.

James M. Buist.—The American horticultural papers announce the death of Mr. James M. Buist, for nearly forty years florist at Milford, Pennsylvania. Mr. Buist, who died on April 18, in his 95th year, was born in Scotland. At the age of 25 he went to America, and his first and only employment was with Andrew Reid, a florist. Upon Mr. Reid's death, Mr. Buist bought the business. He retired several years ago. He leaves three sons and one daughter.

Lieut. E. R. Rides.—After serving with the colours since the outbreak of war it was the sad fate of Lieut. E. R. Rides to succumb to injuries received during a motor accident shortly after demobilisation. He was the only son of Mr. H. Rides, of Central Avenue, Covent Garden, and for several years he contributed the market notes on fruits and vegetables to our columns. He was only 34 years of age. The very deepest sympathy is being expressed in Covent Garden for the widow and parents of Lieut. Rides, who have been so suddenly bereaved. The funeral took place at St. Marylebone Cemetery on the 25th ult.

LAW NOTE.

At the London Bankruptcy Court, an application was made for the discharge of William Henry Maurice Randall, of 150, Leadenhall Street, E.C., and residing at 43, Murchison Road, Leyton. The Official Receiver reported that the Receiving Order was made on October 2, 1912, on a creditor's petition. The liabilities were returned at £2,217 15s. 11d., and the assets, which were estimated to produce £530, had not realised anything.

The debtor attributed his failure to having incurred liabilities amounting to £2,467, in the promotion of The Fruit and Vegetable Growers' Association, Ltd., a company promoted to supply fruit and vegetables direct from the grower to the consumer without the intervention of the middleman. The Official Receiver submitted that the debtor had committed the following offences against the Bankruptcy Act. That his assets were not of a value equal to 10s. in the £, and that he had brought about his bankruptcy by rash and hazardous speculation.

Mr. Kingham, barrister, who appeared for the bankrupt, asked the Court to grant an immediate discharge upon the debtor consenting to judgment being entered against him for £50, and the learned registrar granted the debtor an immediate discharge upon those terms.

TRADE NOTES.

The market exhibit arranged by the Chamber of Horticulture at Chelsea on July 2 and 3 in aid of the St. Dunstan's Fund for Blinded Soldiers and Sailors was very successful despite the inclement weather, and the St. Dunstan's Fund received from the exhibit £21 14s. 2d. in money, and gifts of 112 lbs. of Cherries, 40 lbs. of Apples, 15 lbs. of Grapes, 12 lbs. of Red Currants, 10 lbs. of Gooseberries, and 40 Ferns and other plants.

On Monday last the directors and employees of the firm of Messrs. Watkins and Simpson, wholesale seedsmen, Drury Lane, spent an enjoyable day on the River Thames on the occasion of their "Victory" outing. As with other firms of a similar nature, it has not been possible for this one, owing to the exigencies of the times, to hold an annual outing during the past four years, and this holiday was intended to mark, in some small degree, the firm's appreciation of the splendid efforts of the staff to cope with the abnormal increase of work during a time of great difficulty. The party, which numbered about ninety, entrained at Paddington for Windsor, where a steam launch was in waiting to make the remainder of the journey by water to Reading.

Before reaching Marlow, lunch was provided in the saloon of the launch, and opportunity was afforded for a brief inspection of this interesting riverside town. After lunch the journey was resumed and Reading was reached about half-past seven, the party, meantime, being entertained to tea on the launch. In returning thanks to the firm for its kind hospitality, Mr. Orton, the manager of the vegetable seeds department, referred to the good feeling that existed between the members of the staff and the three directors, and hoped that those relations would continue. Mr. Watkins, in reply, traced the history of the firm since its establishment forty-three years ago in a small way, in the Savoy, to the newer home in Drury Lane. He pointed out that very many of those present had been with the business from twenty-five to thirty years, and that one

* Rh. sp. F 848.

member, whom he regretted was not present, had thirty-eight years' service. He referred to the need for co-operation between employers and employees during the time of reconstruction with which the country was faced, and he was proud of the fact that he was supported by a loyal body, which was a valuable asset for any employer, and especially at the present time. The homeward journey was made by train, and Paddington was reached at 9.30 p.m., after a most enjoyable day.

Messrs. Allwood Brothers, Hayward's Heath, inform us they were awarded a Large Gold Medal at the Royal Agricultural Society's Show at Cardiff for their exhibit of perpetual-flowering Carnations and varieties of their hybrid Dianthus Allwoodii. The Gold Medal awarded to Messrs. Alex. Dickson and Sons, for their display at the recent meeting of the National Sweet Pea Society, was a large one—the Society's highest award.

Nurserymen interested in the export trade are reminded that the general importation of plants into the United States of America has been prohibited by the American Government. Bulbs, seeds, fruit and Rose stocks, a limited quantity of new varieties of nursery stocks and necessary propagating nursery stocks are, however, allowed to enter under certain conditions. Special permission to send these should be obtained from Washington; and the goods must be accompanied by a certificate issued by the Board of Agriculture and Fisheries that the nurseries in which the plants were grown are free from injurious diseases. Nurserymen proposing to export plants should inform the Secretary, Board of Agriculture and Fisheries, 72, Victoria Street, S.W.1, in order that arrangements may be made for the inspection of the nurseries during the summer months.

The firm of Messrs. Learmont, Hunter and King, Ltd., Dumfries and Maxwelltown, has introduced a profit-sharing scheme by which the employees will receive a substantial interest in the success of the business. The scheme was announced at a social meeting of the employees, held recently in Dumfries. Mr. Hunter, one of the directors, explained the scheme, and trusted the employees would do their best to make a flourishing business still more successful. He regretted the absence of Mr. John Learmont, another director. Mr. King, a director of the firm, also spoke and commended the scheme to the employees. Mr. Kenning and Mr. Douglas, two of the departmental heads, expressed their appreciation of the scheme, which is of a highly favourable nature to the employees, and has now come into operation.

CROPS AND STOCK ON THE HOME FARM.

MILK.

THE long continued dry weather is having a serious effect upon the quality of milk, owing to the shortage of desirable grass, especially the aftermath following a hay crop. Without a heavy rain—which has not fallen in many southern counties since the middle of April—grass of a desirable nature cannot grow freely. It is useless to allow grass land to continue in a state of poverty, for although such a method of farming may save the purse for a time, there is subsequent loss, and it is foolish to expect grass fields to continue to yield full crops without any assistance whatever beyond natural rainfall. Much milk has failed to meet the butter fat test —3 per cent.—even in the case of Guernsey cows, thus proving how easily even this class of cattle can be affected by adverse weather conditions.

To improve the quality of the milk recourse must be had to artificial foods. A handful of some suitable cake will assist the animals and tend to improve the quality of the milk. Vetches freshly-cut each day will also assist, and so will Rape if obtainable, while surplus garden Cabbages, where only a few cows are kept, would be useful and so would crushed Oats, Sugar Beet, and Mangold fed to the cows until a plentiful supply of grass is available. On dry hill farms grass shortage is much more pronounced than in low-lying areas. Last season's meadow hay given at milking time would be of great assistance in adding not only quality but quantity also to the milk. Some farmers argue that liberal feeding with such foods as recommended above does not add quality to the milk, but I am of the opposite opinion.

TRIFOLIUM.

Trifolium incarnatum and T. i. alba, as a green food for horses, sheep, cows and pigs are valuable during May, June, and July. Horses especially like this food, as it helps to keep them in good condition; it also saves hay and corn. The common method of culture is to sow 16 lbs. to 20 lbs. of seed per acre on any clean stubble, after harvest, first harrowing or cultivating to obtain sufficient fine soil to bury the seed evenly, and afterwards rolling it down firmly. Where the land carrying a corn crop is in good heart this method of culture is good and entails but little labour and expense. Where, however, the land is lacking manure the Trifolium does not grow to a desirable length or density, and the plant does not tiller out well, which means less weight per acre. Under these conditions farmyard manure at the rate of ten tons per acre spread evenly over and ploughed in at the end of July, or an equivalent in superphosphate of lime, say, 6 cwt. per acre, sown evenly over the surface after ploughing, will improve matters. The harrowing and rolling required to obtain a firm seed bed will incorporate the manure with the soil, and not so deeply as to be washed out of the immediate reach of the roots by rains. A firm seed bed is necessary to success, and so is a well-pulverised surface to ensure even germination. Too much harrowing and rolling cannot be done when the soil is in good condition. A suitable time to sow the seed is during the first two weeks in August.

ONIONS.

Onions are now included in many farm crops, as they are profitable when well managed and the season is suitable. On the whole, in spite of dry weather, the plants, where sowing was done early in March, are looking well. No doubt the method of raising the plants under glass and planting them out, produces the heavier yield, but scarcity of labour almost prohibits this method. The Tripoli varieties, sown early in August and allowed to remain thickly in the rows, find a ready sale in the spring. The continual stirring of the soil during dry weather does much to aid the growth of the plants and favour early ripening of the bulbs, which naturally enhances their keeping qualities.

RYE.

During the last few years Rye has been in demand, fetching the same price as Wheat. The straw, too, is especially valuable for the thatching of buildings. Rye will succeed on poor light soils much better than Wheat or Oats. A summer fallow to cleanse and purify the soil, with 3 cwt. superphosphate of lime applied at sowing time, will produce a full crop of this cereal. The main point is to sow early, in September, to allow the plant to be firmly established before frost comes, as this sometimes loosens the roots and reduces tillering, which means a smaller yield. Green Rye is valuable for sheep in April or May, should Turnips or Swedes be scarce, therefore a good breadth of Rye is always useful. *E. Molyneux, Bishops Waltham.*

A meeting of the Agricultural Wages Board was held at 80, Pall Mall, London, S.W.1, on Friday, the 4th inst., Sir Ailwyn Fellowes presiding.

The Chairman announced that Mr. F. Popplewell has been recalled by the Ministry of Labour, by whom his services had been lent, and that Lord Ernle had appointed Mr. E. W. Moss-Blundell as Secretary to the Agricultural Wages Board.

After considering the objections lodged to their proposals of the 4th June to fix special rates of wages for the corn harvest in certain areas, and the reports on the proposals made by the District Wages Committees concerned, the Wages Board decided to issue orders fixing special harvest rates for the following areas: Cambs., Cheshire, Derby, Dorset, Devonshire, Gloucester, Hereford, Lincolnshire, Nottinghamshire, Oxon, Somerset, Suffolk, Surrey, Wiltshire, Yorkshire, Anglesey and Carnarvon, Denbigh and Flint. Although the proposal for Cambs. applied also to Huntingdonshire and Bedfordshire, which form part of the area of the same District Wages Committee, the Board, in view of the objections received from those counties, decided not to fix any special corn harvest rates for Huntingdonshire and Bedfordshire, and consequently in those counties, as in all the other areas in England and Wales not specified above, the question of any extra payment for the corn harvest will be a matter for mutual agreement between employer and worker.

The Board also considered the objections received to their proposal of the 3rd June to increase the ordinary minimum and overtime rates of wages for female workers of 18 years of age and over, together with the reports from the District Wages Committees on the proposal, and decided to make an Order (to come into force on the 14th July) to increase the rates in accordance with the proposal, the effect of which is that the minimum rates for female workers of 18 years of age and over in all areas in England and Wales, except Yorkshire and Cumberland and Westmorland, will in future be 6d. per hour, with overtime rates of 7½d. per hour for week-days and 9d. for Sundays; in Yorkshire and Cumberland and Westmorland the minimum rate will be 7d. per hour, with overtime at 9d. an hour on week-days and 10½d. on Sundays.

On a report presented by Sir Henry Rew from the Committee on "Allowances" with regard to recommendations from District Wages Committees on the subject of certain revisions in the values allowed for board and lodging in part payment of minimum rates of wages, the Board decided that immediate effect be given to the decision at their previous meeting to increase the value for full board and lodging for female workers of 17 years of age and over in all areas in which it is at present less than 13s. a week, to that amount, with proportionate increases in the other items of board and lodging for such workers and in all such items for female workers below 17 years of age. The Board also adopted the Allowance Committee's recommendations that the determinations of the Northumberland and Durham Staffordshire, Surrey, Glamorgan and Monmouth and Pembroke, Carmarthen and Cardigan District Wages Committees, for certain increases in the values of board and lodging for male workers should be approved.

The board decided to give notice of proposal to vary the special minimum rates fixed for stockmen of all classes which were based on a week of "customary hours" so as to provide in the case of Anglesey and Carnarvon, Berkshire, Derbyshire, Dorset, Hampshire, Lincolnshire, Northumberland and Durham (except in the case of whole-time shepherds) and Yorkshire that these classes of workers should be paid at the ordinary and overtime rates; in the case of Cambridgeshire, Huntingdonshire and Bedfordshire, Cumberland and Westmorland, and the Furness District of Lancashire, Denbigh and Flint, Gloucestershire, Merioneth and Montgomery, and Warwickshire, that they should be paid at a higher weekly minimum rate calculated on the ordinary and overtime rates so as to provide that the workers are paid the equivalent of the ordinary and overtime rates for a fixed number of hours which is higher than the number of hours on which the weekly minimum rates for ordinary labourers is based; and in the case of Norfolk and Suffolk at the ordinary rates with an additional inclusive weekly sum to cover time spent by workers of these special classes in connection with the feeding, cleaning, etc., of stock. Before an Order giving effect to the proposal can be made a month must elapse from the date on which the Notice of Proposal is published.

MARKETS.

COVENT GARDEN, July 9.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

REMARKS.—White flowers are still a very limited supply, and prices for such kinds as Achillea, White Stock, Pelargoniums and Sweet Peas are even firmer than last week. Hardy flowers show little change from last week. The consignments of Carnations are sufficient for the demand. White and mauve Statica sinuata is arriving in large quantities, but the prices for these remain firm. Lilium longiflorum continues to arrive in excellent condition. There is no fresh subject to record this week, and the requirements throughout the market appear to be very moderate.

REMARKS.—Cold rain and lack of sunshine have shortened supplies of home-grown produce, and English outdoors fruits available are in firm demand, doubtless owing to the large quantity of sugar lately released for jam-making. Supplies of English and French Black Currants are in fair quantity. Raspberries and Red Currants are in good demand, but in shorter supply. Strawberries are still available, but in small quantities. Spanish Greengages are in limited supply. Cherries arrive in fair quantity, and prices are well maintained. English and Guernsey Grapes are available, but Peaches, Nectarines and Figs are not plentiful. English Melons are scarce, but a few Dutch Canteloupes are now coming to hand. A new shipment of Pines is just to hand in good condition. Tomatos and Cucumbers are more plentiful and in good demand. Peas and French Beans are in good request, but the supplies are very short. New Potatos arrive in increasing quantities, and prices are lower.

GARDENING APPOINTMENTS.

Mr. B. Gaiger, for the past 13 years Gardener to Major A. W. HUNTINGTON at Oakley Park, Staffs., and Shipton Court, Oxford, as Gardener to the same gentleman at Wellsbourne House, Warwick.

Mr. J. Carpenter, for the past eight years Gardener to R. J. BLACK, Esq., The Knipp, Chiddingfold, Surrey, as Gardener to the same gentleman at Midgham Park, Reading, Berks.

Mr. J. E. Jones, for the past four years Gardener to J. BLISS, Esq., Boarbank Hall, Grange-over-Sands, as Gardener to T. A. ARGLES Esq., Eversley, Milnthorpe, Westmorland.

Mr. A. Thompson, for three years in the R.G.A., and previously Foreman at Kilkenny Castle, Ireland, as Gardener to J. DIXON, Esq., Spring Grove House, Oughtibridge, near Sheffield, Yorkshire. (Thanks for 2s. for R.G.O.F. box.—EDS.)

Mr. G. Butler, recently demobilised after 2 years in His Majesty's Forces in France, and previously for 5 years Gardener and Steward to George A. Kessler, Esq., New York Lodge, Bourne End, as Gardener to Louis Bleriot, Esq., Riversdale, Bourne End, Buckinghamshire.

Answers to Correspondents

AMERICAN GOOSEBERRY MILDEW: *J. S. H.* The disease is American Gooseberry mildew, and its appearance should be notified to the nearest representative of the Board of Agriculture, as it is a notifiable disease, and there are penalties attached to the withholding of information. Under certain circumstances the disease spreads with considerable rapidity, and every effort should be made to stamp it out by tipping the branches and by spraying infected bushes with weak Burgundy mixture. Full particulars of the methods to be followed for the suppression of American Gooseberry mildew will be found in *Gard. Chron.*, April 12, 1919, p. 181.

BOOK: *G. T. T.* *Modern Fruit Growing*, by W. P. Seabrook; price 5s., post free, from our publishing department

BOOKS ON DISEASES AND PESTS: *J. W. S.* Either of the following books are useful: *Diseases of Cultivated Plants and Trees*, by George Massee, published by Messrs. Duckworth and Co., 3, Henrietta Street, London, W.C.2, or *The Book of Garden Pests*, by R. Hooper Pearson, published by Messrs. John Lane, The Bodley Head, Vigo Street, London, W.1.

FAILURE WITH CUCUMBERS: *P. R. M.* There is no disease apparent in the specimen received. The trouble is most probably due to an excessive application of water to the roots after the plants have been allowed to become dry during a period of dull, cool weather.

NAMES OF PLANTS: *A. W. P.* 1. Impatiens balsamifera; 2. Spiraea canescens; 3. Veronica spicata var.; 4. Piptanthus nepalensis. *A. Neal.* 1. Ptela trifoliata; 2. Sambucus nigra var. laciniata; 3. Deutzia crenata var. fl. pl. extus purpurea; 4. Leycesteria formosa; 5. withered. 6. Hibiscus syriacus var. *R. A. Clark.* The Thorn is Crataegus tanacetifolia; the "Sycamore" Acer coriaceum; the flowering plant Olearia macrodonta. *Lily.* A form of Lilium elegans. *G. B.* Magnolia Watsonii. *W. H.* Tradescantia virginica (Spider wort). *M. I. D. I.* We cannot undertake to name florists' varieties of Roses owing to the difficulty of making proper comparisons in a large collection. Your best course will be to send numbered specimens to the Rose grower from whom you purchased your plants, as he will be in a better position to determine the varieties. *D. R.* Rosa multiflora. *W. J. W.* Amelanchier canadensis.

PELORIA IN FOXGLOVE: *A. C. H.* In the case of flowers which have a somewhat irregular form it often happens that one or more blooms become regular, and this has happened in your Foxglove, where the apical bloom is erect and regular. This interesting transformation is known botanically as peloria, and Foxglove and Antirrhinum are plants in which it is frequently met with.

PRESERVING VEGETABLES: *S. H. G.* We hope to furnish you with a reply during the next few days.

PROLIFEROUS ROSE: *M. W. A.* Proliferation is of fairly common occurence in certain flowers, and is due to the abnormal development of buds which, in the ordinary course of events, are not developed. These buds may be at the base of a flower head, between the calyx segments, or at the base of petals. The abnormal development which gives rise to proliferous flowers is generally due to an excess of moisture, artificial or otherwise, accompanied by warm weather. In certain flowers, as in the Hen and Chicken Daisy, proliferation has been fixed, and is now a fairly constant character.

SILVER LEAF DISEASE: *E. M. M.* This complaint is spreading to gardens in all parts of the country and threatens to become one of the most serious troubles of fruit-growers. Investigations have proved that the fungus, Stereum purpureum, is present in affected trees, but no remedy is known, and the only course is to cut out the diseased branches and burn them. The parts removed should be cut back beyond the point where the wood is coloured brown. The walls on which the diseased trees have been trained should be coated with hot lime-wash, and the old soil removed. It would be advisable to defer the planting of fresh trees for a season or two and to use the walls for training another crop, such as Tomatos. (See leading article in the last issue, p. 8.)

SPOT ON ODONTOGLOSSUM: *Orchid.* The disease known as "Spot" on Orchids is due to a collapse of the tissues of the leaves and bulbs. The real cause of the trouble is usually a lack of healthy roots, and wherever the rooting material is unsatisfactory and watering is carried out carelessly roots are certain to become unhealthy, and often die. The remedy is to be found in the provision of smaller pots, ample drainage, porous rooting material and extreme care in watering. Remove all badly affected back pseudo-bulbs before repotting the plants.

SUCCULENTS: *T. W. T.* Write to Mr. Hemsley, Nurseryman, Crawley, Sussex, who may be able to supply you with the succulent plants you wish to obtain.

The ENTERPRISE Clip Bracket

does away with the old way of tying with string.

You can train Vines, Creepers, Tomato Plants, Plants and Cuttings of all descriptions with the aid of this clip bracket.

All it is necessary to do is: Place clip on stick at the desired spot and place plant in clip. As the plant grows so the clip is moved.

Nurserymen, Gardeners, and Amateurs will find this clip most useful and labour-saving, in fact, it combines work with pleasure.

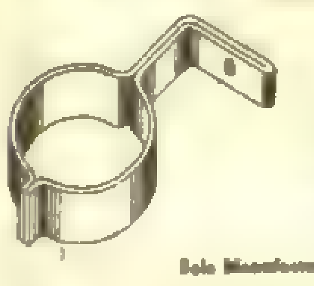
Made in various sizes for different sized sticks.

Per 12/- Gross.

Carriage paid on all orders of £2 to any part of U.K. Smaller lots at 1/- per dozen and postage 3d. per dozen extra.

SPECIAL TERMS TO AGENTS.

FOR WALL SUPPORT, we make a special clip as illustrated.



If unable to purchase the "Enterprise" Clip Bracket locally, write to manufacturer giving seedsman's or ironmonger's name

LAND SETTLEMENT.

I. THE OPPORTUNITY.

ALL who are interested, whether directly or indirectly, in the present and pressing problems of land settlement, should study the latest "Reconstruction" pamphlet of this title, issued by the Ministry of Reconstruction and obtainable from any bookseller for two pence.

The object of the pamphlet is to state the opportunity for successful land settlement, which this country offers at the present time. Such a statement is urgently needed and deserves a wide publicity, for at the present time, the stream of emigration dammed back during the war, is beginning to flow again in more than pre-war volume, and as a consequence many men and women of enterprise are leaving this country to seek fortune elsewhere. Nor is this by any means to be deprecated so long as those who emigrate are not compelled to go from a belief that this country has nothing to offer them. For as this pamphlet states, such is not the case. "There is no land more rich or more desirable." The soil of Great Britain can carry a larger agricultural population than occupies it at present.

The area of the land of the United Kingdom is seventy-six million acres, of which thirty-two million acres are in England, twenty in Ireland, nineteen in Scotland, and five millions in Wales. Of the seventy-six million acres, about three fifths, *i.e.*, nearly forty-seven million are under cultivation.

The land under the plough in the United Kingdom is nearly twenty million acres, and of this area, the greater part was in 1914 either under rotation grasses or was cropped for feed for stock. Wheat, Barley, Potatos, fruit, and other market garden crops occupied only about one quarter of the ploughed land.

One seriously misleading statement contained in the pamphlet which should be corrected at once, lies in the assertion that in previous days, we produced "the great bulk of vegetables, poultry, and eggs we required." In point of fact, we imported before the war, about ten million pounds-worth of fruit and vegetables, and a like value of eggs and poultry. At present values, this would come to nearly forty million pounds-worth of imported fruit, vegetables and poultry. Whether the pamphlet is right in implying that this is but a small part of the total only a reference to the statistics of home production could show; but evidently forty million pounds-worth of imported foods of kinds which are capable of being grown in sufficient quantity in this country, is no small matter.

An interesting summary of agricultural holdings in England and Wales, shows that there are 420,000 farms or holdings.

These may be classified into:—

Very large farms: 14,000=25 per cent. (500 acres and upwards.)
Large farms: 38,000=29 per cent. (Averaging 200 acres.)
Ordinary Farms: 93,000=30 per cent. (Averaging 90 acres.)
Economic small holdings: 78,000 =10 per cent. (Averaging 35 acres.)
Part time holdings: 83,000=1 per cent. (Up to 5 acres.)

Although of great importance the two million allotments, many of which are of very small extent, may be omitted here: but even if included, would bring the area under part-time holdings to only five per cent. of the total cultivated land.

The progressive depopulation of the country side which accompanied the laying down of plough land to pasture during the last forty years, resulted in a decrease of one-fifth in the number of agricultural workers, and it is estimated that this decline was at the rate of seven men for every hundred acres of arable land laid down to grass.

The steps which are now being taken to restore men to the land, are briefly summarised in the pamphlet, but having regard to the great importance of this subject, we propose to deal with it in a subsequent article.

Although everyone will agree that there is, as mentioned in the pamphlet, a large scope for land settlement in this country, it would be foolish to ignore the difficulties which must be overcome if success is to be achieved — one of these difficulties lies in the enhanced cost of building and appliances, and of land; another in the competition with which in pre-war times the market gardener and fruit grower was faced. To get over this difficulty in a way acceptable alike to producer and consumer, will prove a heavy tax on statesmanship.

ORCHID NOTES AND GLEANINGS.

DISAS GROWN IN LEAF-MOULD.

THOSE who saw the splendidly-flowered plants of Disa shown by Messrs. Flory and Black, of Slough, at the Royal Horticultural Society's meeting on the 1st inst. (see *Gard. Chron.*, July 5, p. 11), were much impressed by their extraordinary vigour in very small pots, each specimen bearing a stout spike three to four feet in height. The selection shown was a sample of a very fine batch raised at Slough where, under the treatment given, they thrive to perfection, although many growers fail to get satisfactory results with these beautiful Orchids. The success at Slough is largely attributed to the fact that they are potted entirely in decayed Beech leaves, which have been stored in a heap for three years. At potting time the pots, after crocks are placed therein for drainage, are filled nearly to the brim with decayed leaves firmly pressed down. The strongest tubers intended for next season's flowering are planted in the leaves and afterwards a surface of living Sphagnum-moss is added. The plants are placed in a moist cool house and carefully watered, the supply of moisture being increased as growth and flower-spike develop. Those who do not succeed with Disas potted in other composts, should try the experiment. The cultivation of these tuberous, rhizome-bearing Disas in leaf-mould may prove a permanent success, although the formerly lauded leaf-soil culture of Odontoglossums and other epiphytes in most cases was a costly failure.

LAELIO-CATTLEYA MENDIONA.

A FIRST flower of a cross between Cattleya Mendelii and Laelia Iona (Dayana × tenebrosa) is sent by Eustace F. Clark, Esq., Evershot, Dorset, who states that the plant is Cattleya-like in growth and dwarf in habit, a character probably derived from L. Dayana. In size and shape the flower is intermediate between that of C. Mendelii and L. tenebrosa, but in colour it closely approaches some of the forms of C. Mendelii. The lanceolate shaped sepals and broader petals are white, tinged and veined with pale mauve. The lip, which is rather narrow and elongated, is tinged with mauve at the base, the median area being primrose yellow and the front dark purple.

Mr. Clark also sends a specially fine Laelio-Cattleya Lucia (C. Mendelii × L. cinnabarina), which, although not of such broad proportions, may be likened to a bright yellow C. Mendelii with deep crimson front to the lip.

FLORISTS' FLOWERS.

THE BORDER CARNATION.

THE article by *Old Florist*, on p. 4 in your issue of July 5, is much to the point, and I agree with most that he writes.

The art of dressing and showing blooms on cards is going out slowly but surely, and although I consider that the old striped flowers are shown to the best advantage when laid out carefully on cards, they may be displayed almost equally well in vases, as well as the White Ground Picotees, when invisible cards or backs are allowed to support the guard petals, such as are now stipulated for at the Southern Carnation and Picotee Society's show in London. I can still tolerate the striped flowers, Bizarres and Flakes, in boxes, spread out on cards, but see no reason why any other kind should be tolerated shown in such a way.

But why the Midland Society allows Selfs, Fancies, Yellow Ground Picotees, as well as the White Ground Picotees to be shown on cards, passes my comprehension, and I consider it high time for that Society to give up the practice, at least as regards the three first-mentioned kinds.

Old Florist merely touches on one very important matter, namely, the advance that has been made in recent years in rigidity and strength of stem in many of the recently introduced border varieties. I wish to emphasise the point, as I consider it the greatest improvement that has taken place since Selfs, Fancies and Yellow Ground Picotees became the leading features at shows. I could name not fewer than a dozen varieties which would show themselves equally well with the best of to-day's much fancied perpetual varieties, in fact, they would carry their blooms without wire supports on stems, say, two feet in length. And during Peace Year I hope to see this fact brought to notice by our Border Societies in order that classes for such flowers may be arranged for competition in 1920.

Diverging somewhat from the border Carnation to the perpetual flower, I consider it time that raisers of seedlings of that kind should look

a little more to form and symmetry of petal and a little less to commercialism, which seems up till now to have been their main object. I feel almost certain that the perpetual varieties might yet be looked upon favourably even by a 1919 florist, provided the flower is much improved in its general outline and the petals in the centre were formed more like the outer and guard petals, instead of standing straight up and crowded to excess, such as in a double annual Poppy.

Granted the perpetual Carnation is a valuable

[*Photograph by E. J. Wallis.*

Fig. 15.—Catalpa speciosa in flower.

market flower on account of its very floriferous habit, and possessing more of the old Clove scent than the general run of "Borders," on the point of variety of colouring it is, however, a long way behind, and there has not been as yet a real yellow self introduced. The recent award of the R.H.S. to the variety "Sunstar" was doubtless made because this happens to be the nearest approach so far to yellow, but I look upon the colour of the flower as a very washy yellow.

As regards comparing the Border with the Perpetual Carnation, the ideals of the two are at present so widely separated that it is unwise for them to enter into competition, such as happened at St. Dunstan's Flower Show, at Chelsea, on the 3rd and 4th inst. I happened to be the "Border" judge of the three judges selected for Carnations generally at that Show, and we had no difficulty in finding the best of each kind introduced since August, 1914, but when we were asked to give a verdict for the best Carnation, both kinds included during the same period, the matter was entirely different. Being outnumbered I, of course, had to give in, but not without a vigorous and, I trust, clearly audible protest. The sequel arose when I learned on the following day that the special judges awarded the trophy for the best exhibit of Carnations in the Show to the border varieties exhibited by Mr. James Douglas, and this, I infer, goes to prove that whatever the perpetual Carnation may be from September to May inclusive—and I grant that during these months it reigns supreme—it is no match for the border Carnation during June, July, and August.

Had the vase of "borders" which competed with the perpetual Carnation for the smaller award contained anything like an equal number of blooms, I wonder how my two fellow judges, who were both, in the first instance, "perpetual" fanciers, would have decided?

In conclusion, and in sympathy with the views of *Old Florist*, I have no hesitation in saying that, from a florist's point of view, there is still only one Carnation for us. *R. Morton.*

TREES AND SHRUBS.

CATALPA SPECIOSA.

[The Western Catalpa.]

Although it is now many years since Catalpa speciosa (see Fig. 15) was introduced to this country, it is only recently that it has flowered freely enough to justify its place in gardens as a flowering tree. But if, having now reached the blossoming age, it continues to flower annually, it will prove a great acquisition, for it is at its best from the end of June well on into July, a period of the year when it has but few rivals. Coming into flower a fortnight or three weeks before C. bignonioides, it lengthens the Catalpa season very considerably. A tree near King William's Temple at Kew has made a very good show this year.

It is quite easy to confuse this Catalpa with the older and better known C. bignonioides unless trees of each kind are growing near enough to be compared. But besides its earlier blossoming, it may be distinguished out of flower by the leaves being longer and more tapered towards the apex, and especially in being inodorous, those of C. bignonioides having a very perceptible and somewhat unpleasant smell when crushed. The flowers are produced in panicles and are rather larger and less densely packed compared with those of the other species. The corolla is about two inches long, with a bell-shaped tube and a frilled, lobed margin, the tube having two rows of yellow spots; there are also purple spots on the lower lobe. The remarkable fruits, which I have not yet seen on cultivated trees, are up to 20 inches in length, and not much thicker than a very stout pencil. The tree, a native of the S. and S.E. United States, is more erect and pyramidal in growth than C. bignonioides, and in a wild state, according to Prof. Sargent, is occasionally 120 ft. high, with a trunk over 4 ft. in diameter. The tree produces a very valuable timber, almost unequalled in durability when in contact with the soil. For this reason it is prized for railway sleepers, gate posts, etc. Gate posts are known to have stood in place and undecayed from 50 to 100 years. *W. J. B.*

HARDY FLOWER BORDER.

LYCHNIS CHALCEDONICA.

This old flower is again in bloom, and looking over that delightful little book, *Stray Leaves from a Border Garden*, I have been interested in what Mrs. Milne Home says of it under date of July 9. This is written shortly before the corresponding date, and the Scarlet Lychnis has been open for a week or more, but I feel sure that the garden which called forth such a delightful causerie from Mrs. Milne Home, is in a colder district than this. The authoress tells us of its popular names, all of which I have heard before. These are, Summer Lightning, Flower of Constantinople, Bristol Flower, and Maltese Cross. Mrs. Home quotes an old saw:—

"The Scarlet Lychnis, the garden's pride,
Flames at St. John the Baptist's tyde."

Old writers devoted much notice to the plant but within late years it has been less cultivated. Yet its brilliant scarlet flowers in good heads on stems from 2 to 4 feet high, are of considerable effect in the herbaceous border. I do not care much for the white variety, which is less common. The double forms were popular in former days, and are still in request by a few, especially those who exhibit at early shows, when a good bunch of the double Scarlet Lychnis

often attracts the eyes of a judge. Apart from this, however, the old Lychnis chalcedonica is worthy of being cultivated in any border of hardy flowers, especially if the soil is rich and the situation sunny.

ALYSSUM SINUATUM.

THE late Mr. W. E. Gumbleton, a most acute and incisive critic of flowers, would probably have designated the above as a "pooh" plant, and, failing that extreme depreciative expression, would certainly have called it a "tush" one, these being the two most contemptuous terms in his critical vocabulary. It may, therefore, appear needless to say anything of such a flower at the present time, when we are enjoying a wealth of floral beauty in the beginning of this month of July. Yet there are some who would describe Alyssum sinuatum as the nearest approach to a summer-flowering Madwort or Gold Dust we have. It comes into flower soon after A. saxatile, and lasts until well into autumn. Its foliage, which is not so white as that of the Rock Madwort, is sinuate. The flowers are borne more erectly, and the whole habit is less trailing than in A. saxatile when it is of large size. The seeds came to me from abroad, as those of A. gemonense, some years ago, but the name has been given as A. sinuatum by a competent authority. The plant needs a dry soil and grows about one foot high. The flowers are of a good yellow tone, and, in a mass, look fairly well, although poor individually. *S. Arnott.*

TWO NEW CARNATIONS.

ON the occasion of the British Carnation Society's exhibition, held at Westminster on May 13 last, the Misses Price and Fyfe, Birchgrove, East Grinstead, exhibited several new, seedling, perpetual-flowering Carnations, and two of these varieties appeared to be of outstanding excellence (see Fig. 16). The white variety, named Isobel Felton, has such a beautifully rounded form that it attracted the attention of those lovers of border Carnations who place regularity of outline and breadth of petal before all other attributes. Fortunately, the pure white blooms are full, substantial, and borne on long, stiff stems, consequently they lack no good point from a decorator's point of view. The second variety, named Scarlet Dragon, has a larger, very solid and yet elegant flower of rich, glowing scarlet colour.

LETTERS FROM SOLDIER GARDENERS.

CHARALAMBOS' GARDEN.

CHARALAMBOS was a Greek wartime policeman with whom I made friends on the basis that we were colleagues, his job being to keep the natives of the village in order and mine to prevent the "Tommies" from entering it without due and lawful authority.

He came from Athens, was very well educated, and had the most supreme contempt for the prehistoric ways of the natives of Macedonia. During the winter we studied together and in a few weeks could converse fairly well in each other's language. When the last blizzard took its departure and the ridiculous looking long-legged storks came back and began to stand contemplatively on the house roofs, I, after the fashion of Englishmen all the world over, began to think about gardening. So far as I could see, I was booked to stay there indefinitely and I set to work with my two comrades to cultivate about nine or ten rods of ground adjacent to our quarters. One or other of us used to work at it during our spells off duty and we did it thoroughly, trenched two spades deep and put everything in nice, military-looking rows. We had to fight with jackdaws, which pulled up the sprouting Peas and laid them in long neat lines, and we were constantly on the alert to threaten with fearful penalties the shepherd boys who went to sleep and allowed their charges to wander on to the unfenced plot.

Charalambos was at first inclined to pity men who could toil in this absurd fashion when they could get all that was necessary to eat without it, especially, as he said, when we never knew at what moment we might have to leave it all, but when our things came up and looked very green and tempting, he began to recall half forgotten memories of gardens in his own homeland. One day I went round to his quarters, which were in an old Turkish chapel and found him with his coat off, digging a trench in the graveyard. He had already unearthed the crumbling bones of two Turks—they bury very shallowly in those parts—and I wondered whether he had got hold of some tale of treasure buried with these folks and was out to get rich quick.

But he told me that he was going to make a garden, and when he explained the scheme to me I began to wonder whether his plan wasn't a good deal ahead of mine. The trench, apparently, was to be a sort of sunk walk round the beds, so that the plants could be attended to without stooping. "Summer, plenty hot, very to water, I," he explained.

He and his comrade had really more time on their hands than we had, and in the course of a week the garden had been completed with the exception of planting. It was quite an elaborate affair, though tiny. It was oval in shape, the length less than a hundred feet, and the breadth at the widest part, only a little over twenty. Besides the sunk walk round the outside, there was a path down the centre and the ground each side of this was divided into four beds. There was certainly no excuse for treading on the beds at any time. They had not bothered about trenching the ground, but had imported plenty of rotten manure and appeared to pin their faith on watering. When it came to planting, I was, to put it mildly, flabbergasted. It was utterly impossible to find any trace of plan. Onions, Peas, Lettuces, Cucumbers, dwarf Beans, Carrots, Aubergines and Cauliflowers were all mixed up together and right in the middle of all, when one would have thought it impossible to squeeze anything further in, Maize, which in a few weeks shoots up to an immense height in that country, was sown haphazard all over the beds.

FIG. 16.—NEW PERPETUAL-FLOWERING CARNATIONS. TOP FLOWER, SCARLET DRAGON; COLOUR, GLOWING SCARLET. LOWER FLOWER, ISOBEL FELTON; COLOUR, PURE WHITE.

One evening Charalambos came and begged a few sprouted Potatos I had left over and these were stuck in the corners between some patches of seedling Marrows. What was to become of the Marrows, I could not see, but the problem was solved later on, when they were transplanted on to the ridge of earth surrounding the outside trench and went rambling among the gravestones at their own sweet will.

Watering, the men did most diligently. They constructed an aqueduct of petrol tins leading from the well head to the garden and spent an hour or two daily in drowning the things in water.

But the crops grew. Long after my garden had been abandoned (we were recalled to Headquarters just as the Peas were swelling nicely in the pods and of course, everything went to rack and ruin) they were cutting Cucumbers and picking Peas—and watering. I am convinced that a chemical friend of mine is right when he says that one can grow plants without soil if one only gives them plenty of water and warmth. I used to visit the village once or twice a week during the summer and there were always a few Cucumbers or Tomatos to spare for me. It was a veritable intensive garden and it was flourishing up to the great day in September when "Johnny" retired and we were ordered to follow on his heels.

I shall long remember Charalambos with affection and not least of all because he is a great gardener. *Herbert Mace.*

PHYLLOPERTHA HORTICOLA, LINN.

This beetle (see Fig. 17), which has been very prevalent in certain districts of Surrey this season (see *Gard. Chron.*, vol. lxv., pp. 308, 310, 321), has several common names, such as June-bug, Bracken Clock, Fernshaw beetle and Fernweb. This multiplicity of names probably owes its origin to two reasons. Firstly, the beetle is very striking in appearance, and secondly, it has the habit of appearing in large numbers in certain years. The beetle (see Fig. 17 A) is about 10 mm. (2-5th in. long). Its head and thorax are greenish, metallic and shining, making a good contrast with the reddish-brown elytra. The antennae are also reddish with a dark coloured club consisting of three plates. These plates, or lamellae, are characteristic of the large group to which this beetle belongs, namely the Lamellicornia. It is thus clearly allied to the common Cockchafer, which it resembles in its larval habits. The adult June-bug may be found on flowers and young trees, and in seasons of abundance, like the present year, may be found damaging fruit. The eggs, like those of the Cockchafer, are laid in the ground, and the larva feeds on the roots of grasses. It most resembles a Cockchafer grub, except that it is smaller (see Fig. 17 B); it is pale in colour, with a dark head and strong mandibles that are black at the tips. The body is clotted with a few brown hairs and usually lies in a curled position. The hind end is darker owing to the presence of digested food remains. The larva remains three years in the soil, and where abundant, causes great damage to turf, killing the grass plants. The presence of the grubs is often indicated by the large numbers of rooks and starlings which feed on them, and thus these birds are very useful in keeping down the pest. As is the case with the Cockchafer, certain years are remarkable for the abundance of the June-bug. It would appear that, for some reason or another, conditions during some critical period of larval life are particularly favourable and that, therefore, an abundance of beetles occur in the corresponding years of emergence. This fact is seen in the American Seventeen-year Locust (Cicada), where the abundant years are well known for any given locality, and warnings can then be issued to the particular locality concerned. In the case of the June-bug, control methods consist in shaking the affected plants in dull weather, when the beetles readily drop, or, where it can be employed, of spraying with lead arsenate. *A. H. Lees.*

[The beetles and damaged Apple shoots and fruits illustrated were kindly sent us by Mr. S. T. Wright from the gardens of the Royal Horticultural Society, Wisley, where the pest has been very prevalent this season, causing considerable damage to many of the crops there. Mr. Wright states that the beetle spread to gardens and farms all round the neighbourhood of Wisley

Fig. 17.—The June bug (Phyllopertha horticola) attacking apples.

and was even attacking the Wheat in some places. The June-bug is especially harmful to fruit crops; a correspondent in *Gard. Chron.*, June 28, 1919, p. 321, stated that it had attacked not only Apples and Pears, but had destroyed the foliage of his Raspberries, and even spread to his Roses.—Eds.]

The Week's Work.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet, Hertfordshire.

Tall Bearded Irises.—Large clumps of these Irises may be lifted and divided most satisfactorily immediately after they have flowered. Plant them on a slightly shaded border in fairly good soil and supply plenty of moisture to the roots (if the weather is dry) until they are established. Keep the beds free from weeds and ply the hoe between the plants at intervals. Thus treated good plants will result and these may be transferred early in autumn to their permanent quarters where they will flower well the following season.

Foxgloves.—A good sowing of seeds of best varieties of Foxgloves should be made now on a well prepared border to raise plants for blooming next summer. Sow the seeds in drills 6 inches apart and transplant the seedlings when large enough to handle in an open situation. Seeds may also be sown amongst other plants in the wild garden, and in a few seasons ample seedlings will spring up from self-grown seeds without any further trouble and make a good display.

Heuchera sanguinea.—This useful dwarf Herbaceous plant should be lifted and divided as soon as the flowers are over. It is necessary to maintain a stock of young plants if large flowers and sturdy spikes are desired. When dividing large clumps reject pieces from the centres of the plants.

Roses.—Anyone intending to plant large quantities of Roses during the coming autumn should prepare notes of the different varieties while they are in flower. A good plan is to pay visits to some of the large Rose growers and select the most suitable varieties.

Garden Roses.—The garden Roses are very beautiful and will grow freely in almost any soil if the latter is properly broken up and manure added. Large clumps or bushes need very little attention when well established.

Sweet Peas.—To prolong the season of flowering remove all seed pods from Sweet Pea plants and keep the roots well supplied with water and liquid manure. In some cases, owing to the drought, growth was greatly retarded, but since rain has fallen the plants have greatly improved and there is a good show of bloom.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Cabbage.—A piece of ground should be enriched with leaf-soil and burnt garden refuse to receive a small sowing of Cabbage seed to provide plants for winter and early spring use. The plants from this sowing often prove very valuable, even in January. When the plot has been well worked, sow the seeds an inch deep in drills drawn one foot apart. Soak the drills with water, sow immediately, cover with fine soil, and then net the plot to prevent trouble from birds. Sutton's Harbinger, April, and Webb's Emperor are first-rate varieties for this early sowing.

Herbs.—Many kinds of herbs will be ready for gathering to dry and store for winter use.

Onions.—Autumn sown Onions are nearing the completion of their growth. If left in the ground longer many of the bulbs will crack and spoil; therefore, lift them carefully and dry them off under cold frames, the lights of which should be withdrawn on all dry days. If the bulbs are well harvested they will keep fit for use until the spring sown crop has ripened, and even longer, thus reserving the latter for spring use. This point should be remembered as Onions

will be exceedingly scarce before next spring arrives. If there is any doubt about a full crop of Onions I should not hesitate to at once sow seed of quickly maturing varieties in watered drills on good ground.

Spinach.—Sow summer Spinach at intervals of a fortnight in various positions, choosing open as well as partially shaded sites. Sow a batch of Spinach Beet where ordinary Spinach does not stand the winter. Choose an open position and sow in lines 15 inches apart; thin the seedlings to 9 inches apart.

Turnips.—Two sowings of Turnips should be made at the end of the month if a good supply of roots is needed for the autumn. From these sowings good Turnips will be produced for lifting and storing. Store before severe frosts set in. Choose Veitch's Red Globe and the Snowball types for this sowing. Allow 16 inches between the lines when sowing to allow freedom for hoeing.

Swede.—The small, quick-growing, garden varieties of Swede should find a place in every garden. Sow at this date, on land that has been occupied with early Potatos. Given a slight application of superphosphate of lime, lightly harrowed in, little else will be needed in the way of preparation. Sow in drills an inch deep and 15 inches apart.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Strawberries.—As soon as the early varieties of Strawberries have finished fruiting all runners not required should be removed, also weeds and rubbish. When this has been done hoe the soil and continue to keep down weeds. The plants should be well watered and given weak liquid manure to assist them to form strong crowns. This treatment also applies to later varieties as they finish cropping.

Walnuts.—Young Walnuts are excellent for pickling, and trees carrying heavy crops should be thinned of some of the nuts for this purpose. To ascertain if the nuts are at a proper stage for pickling, pierce them with a needle, which will pass through easily if they are in the right condition: if the shell is tough the needle will not pass through. Trees carrying heavy crops will be much benefited by receiving copious applications of liquid manure. Feeding is often neglected in the case of Walnuts, but the trees need it quite as much as Apples, and the same is true of Cob Nuts and Filberts.

Cob Nuts and Filberts.—Where close winter pruning is practised, these trees will have made strong shoots, many of which are not necessary and some should be thinned. Shoots required to fill vacant spaces should have the tops twisted out now. This may be done by a twist with the thumb and finger.

Sawfly on Apples.—This insect causes the fruits of Apples to drop, as the mother deposits her eggs in the fruits when they are setting, and the grubs are full fed at the beginning of July, when the Apples drop. All infested fruits should be gathered from the ground and burned, otherwise the grubs will eat their way out, burrow in the soil and remain there until the following spring. The soil should be lightly forked over in autumn to enable birds to pick up the cocoons.

Slugworm on Pears.—The Pear slugworm is of a sluggish disposition, but has a big appetite and soon consumes the soft parts of the leaves, causing them to turn brown and drop. The insects appear during the present month and deposit their eggs on the leaves, and these hatch in a few days. The grubs feed on the leaves till the end of August, when they form a cocoon and enter the ground for hibernating through the winter. As soon as attacks are noticed the trees should be syringed with Quassia extract or soft soap, 2 oz. to one gallon, mixed with ½ pint of nicotine. Freshly-slaked lime dusted on the insects with a dredger will also kill them. Hellebore powder and Paris green insecticide will destroy them, but the latter is an arsenical spray and should not be used when fruit is on the trees.

PLANTS UNDER GLASS.

By JAMES WHITOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian

Begonia.—To obtain good specimen plants of B. Gloire de Lorraine those that are sufficiently rooted in small pots may be transferred to receptacles six or seven inches in diameter. For general decorative purposes 5-inch pots are the most useful size, and a late batch of cuttings grown in 3½ or 4-inch pots will be found very useful. In a house devoted to the flowering of these plants an additional good effect is produced by having a certain number in hanging baskets. Whatever kind of receptacle is used in potting it should be well drained, and filled with soil of an open texture. A suitable soil is formed of three-parts turfy loam, one-part half of dried cowdung and one-half of half-decayed leaves. Pass the dung and leaves through a sieve, and add a sufficient quantity of sharp sand to keep the compost porous. The soil should not be pressed firmly. The plants will grow best in a low-roofed house or pit near the roof glass in a temperature 60° to 65°. Shade from bright sunshine, keeping the house moist. Syringe the plants twice daily, dust the stage frequently with soot, and fumigate the plants occasionally to keep down attacks of insects. Begonia Gloire de Sceaux is a handsome winter flowering plant, and large specimens may be grown in 8-inch pots although those in 6-inch pots are suitable for general decorative purposes. The soil, temperature and general treatment should be similar to those recommended for Gloire de Lorraine. Cuttings of this variety may still be rooted in small pots, plunged in bottom heat. Those raised in this way should be shifted into larger pots before they become pot bound. This Begonia is very subject to infestations of mite, and the house must be fumigated as occasion requires.

Souvenir de la Malmaison Carnation.—It is now time to raise young stock of these Carnations by layering. The shoots will root best in frames, and the latter should be filled with soil almost to the glass. The surface soil for layering should consist of sifted loam, leaf-mould and sharp sand. Prepare the plants for layering; select stout shoots for layers, and remove a little of the foliage to facilitate the work. Make the cut lightly, taking care not to break the stem when inserting the peg. The plants should be watered, shaded and syringed daily. Keep the frame close until roots begin to develop, when air may be given. When well rooted the lights may be removed entirely; soak the roots well before lifting the layers for potting, which should be done firmly.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Cypripedium.—The group of Lady's-Slipper Orchids, which includes C. Lawrenceanum, C. Rothschildianum, C. Sanderianum, C. Curtisii, C. callosum, C. Maudiae, C. Lord Derby and the many others that usually flower during late spring and early summer are attractive and useful kinds. These species and hybrids need the heat of the warmest division, and the plants should be given a position where they can be shaded from strong sunshine. The present is a very suitable time to examine the plants and afford new material to those in need of it, as growth commences afresh soon after the flowering period. These Orchids thrive better potted in Osmunda or A.1. fibre and Sphagnum, with a little good loam fibre added for the strongest growing sorts, than in a heavier material. Plenty of drainage is necessary, as much soil about their roots is undesirable, and every endeavour should be made to keep the compost thoroughly sweet and open. All through the summer and while the plants are growing freely the roots should be abundantly watered, and there should be plenty of moisture in the atmosphere. The species and hybrids with handsome, tessellated foliage enjoy frequent overhead spraying when the weather is favourable.

Succulent-Leaved Cypripedium.—The small group of succulent-leaved Cypripediums, composed of C. concolor, C. niveum, C. bellatulum and C. Godefroyae may justly be included among the gems of this extensive genus, but it cannot be said that these species are so easily grown as the majority of Cypripediums. Plenty of warmth and atmospheric moisture are essential for their successful cultivation, and the plants should be grown either suspended from the roof, or on a stage close up to the roof glass. In a state of nature these plants are found growing in far more sunshine than the majority of species, and they undoubtedly retain their liking for bright light when under cultivation. Shading, of course, is necessary, because if exposed to direct sunshine under glass the foliage would be ruined, but at the same time the plants should not be overshaded. In affording water to the roots the greatest care is necessary, at all times, and more especially during the winter months, when water should not be allowed to remain on the leaves. Whilst these species need a plentiful supply of water during their most active season of growth and should at all times be kept fairly moist, they require to be kept somewhat drier in winter than most Cypripediums. Repotting is best done soon after the plants have ceased to flower. Disturbance, however, should not take place unless the state of the compost and drainage make this necessary. The plants usually grow best in a compost consisting of turfy loam, good peat, and Sphagnum-moss, and as experience has shown that these plants display a preference for limestone, most cultivators find advantage in using this material in lieu of crocks for drainage. Crushed lime may also be mixed with the compost to keep it open. There are numerous hybrids from these species, and while some of them are good growers and much more easily managed than the species, others are found to be difficult of cultivation, and require very careful treatment.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Strawberries.—Let there be no delay in layering suitable runners to obtain plants for early forcing. The prolonged drought having seriously affected the development of early runners, it is necessary to hasten the work. The size of pot is optional; some growers prefer to layer direct into the fruiting pots, others use small pots and transfer the plants to the receptacles in which they will fruit at a later date. In any case the inside of the pot should be quite clean. The soil for potting should consist of turfy loam taken from a stack of turf which has rotted for one year. To each barrow load of soil add a six-inch potful of bone flour and a good sprinkling of wood ash. If the soil is deficient in lime, apply a dusting of air-slaked lime. Loam of a light nature is improved by adding an equal quantity of soil taken from an old Melon bed. If the soil is very adhesive, mix coarse sand with it, as it is essential for water to have a free passage through it. When using fruiting pots let the drainage be perfect; a layer of half-inch bones over the crocks is an aid to growth when the soil has become filled with roots. Soot dusted over the crocks will deter worms from entering the pots during the time they are standing on the soil. The first runner nearest the parent plant should be selected for layering, and those beyond removed. For convenience of watering, etc., when layering on a large plot, arrange the pots in alternate rows. Wooden or bracken hooks may be used to keep the layers in position on small pots, but for larger pots stones or pieces of brick are suitable for the purpose. Layers kept in position by stones root quicker than those pegged in the soil. Water the plants carefully until roots develop freely in the soil, and this is the more necessary in the case of large pots, for if the soil becomes sodden root action receives a check and the plants suffer accordingly. On warm, bright days sprinkle the plants overhead during the late afternoon with clear water. The plants in small pots should be repotted at the earliest opportunity, and afterwards stood on a layer of coal ashes in full exposure to the sunshine.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, JULY 24—
Manchester Victory Flower Show, Platt Fields, Rusholme, Manchester. (3 days).

FRIDAY, JULY 25—
Horticultural Club outing to Wisley Gardens.
Midland Carnation and Picotee Society's Exhibition, Birmingham. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich 62.9°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, July* 16. 10 a.m.: Bar. 30.1; temp. 67°. Weather—Sunny.

The Genetical Society. The formation of a society for the advancement of knowledge in the breeding of plants and animals is an important event in the history of the progress of genetical science in this country. It marks the close of the probationary period to which all new scientific methods must be submitted before they are accepted as part of the general method of scientific discovery. During that period it is the hard task of the pioneers to lay in pain and labour the foundations of the science and at the same time to defend their methods against the attacks and criticisms of colleagues who are apt to resist convictions with a passionate prejudice worthy of a less barren application.

The science of genetics has passed triumphantly through that ordeal. The methods which it introduced have become the recognised means of discovery, not only of the general laws of heredity, but also of new and economically valuable varieties of animals and plants. With the establishment of the science of genetics on a firm basis of ascertained fact, the breeder of plants and animals need no longer rely solely on luck and perspicacity, but may follow his avocation along defined and business-like lines.

This stage having now been reached, it is well that there should be formed in this country a society which, by bringing together all those interested in the science, will help to accelerate the rate of its advance. To ensure a full measure of usefulness to the labours of the society, it is essential that its membership should include not only research workers in and teachers of genetics, but also practical plant and animal breeders, who no less than the scientific workers are interested in and contributory to the advancement of our knowledge of genetics. The advantages of co-operation between the academic workers and the professional plant-breeders are manifest, and it is to be hoped that the membership of the society will be thoroughly representative of both classes.

Inasmuch as the meetings of the society will, as a general rule, be held either at research stations or at plant or animal breeding establishments, it is necessary to limit the number of members in accordance with the amount of accommodation likely to be available at these places. Hence the Society has decided to limit the membership to 120. The number of members already elected is 86, and we have no doubt but that when the existence and objects of the Society are more widely known, the full membership will speedily be secured.

The first meeting of the Society — a report of which is given on p. 44, was well attended, and proved of great interest. It was held at Cambridge, the home of British genetics, and was attended by Mr. W. Bateson, Prof. Punnett, Prof. Biffen, and Miss Saunders, all of whom have contributed so largely to the advancement of genetics. Horticulturists were represented by Mr. A. W. Sutton, who is one of the vice-presidents, and Mr. E. A. Bunyard, who is a member of the committee. As mentioned by Prof. Bateson at the dinner which concluded the proceedings, the foundation of the Society was due to the initiative of Miss Saunders. Everyone of the large number of members who attended the first meeting was impressed with the value which lies before the Society. The science of genetics has a brilliant future and a vast scope. Who shall say what are the limits set by nature to the development of her offspring? It will be the function of the society to help its members and the world at large to make the world of domesticated animals and cultivated plants better than they found it—more prolific, beautiful, resistant to disease, and generally more serviceable to man. Pioneering, unconcerted action, have done much. Co-operation, concerted action and interchange of knowledge should do yet more. We therefore wish long life and prosperity to the Society.

Lord Lambourne has been appointed President of the Bribery and Secret Commissions Prevention League, Incorporated, in succession to the late Sir Edward Fry.

Aberdeen Flower Show.—The Royal Horticultural Society of Aberdeen will hold a flower show in the Duthie Public Park, Aberdeen, on August 21, 22 and 23, the first since 1913. Many valuable prizes are offered for competition, including several challenge cups—some presented by the Society and others the gifts of patrons—and about £200 in money prizes. Some years ago the directors instituted special prizes for Sweet Peas, and these flowers will be at their best in the north at the time of the show. With a view to making this section a distinctive feature, specially valuable prizes will be offered, including the Scottish Challenge Cup of the National Sweet Pea Society, which the directors have secured for their show this year. Many other interesting and novel features, including special prizes for Roses, are also provided in the prize schedule, and it is hoped that, despite the severe handicaps horticulture has laboured under during the past years of war, the show will prove a great success.

The Kew Flag Staff.—It has not been found possible to erect the new flag staff at Kew by Peace Day, as was hoped. The heavy rains have delayed the "setting" of the huge concrete base on the mound and the settings of the great eyes to which the guys will be fixed. These masses of concrete must, of course, be thoroughly set before the giant flag staff is erected. It will perhaps be remembered that the sum of £1,500 was recently voted in "The House" to cover the cost of erection. Besides the concrete foundations, the scheme provides for making a large manhole in order that the base of the staff may be readily inspected from time to time.

Promise of an Unfavourable Harvest.—The monthly agricultural report of the Board of Agriculture states that, mainly as a result of the long drought, all the crops, except hops, show but poor prospects. Expressing an average crop by 100, the appearance of the crops on July 1 indicated probable yields per acre shown by the following percentages:—Wheat, 91; Barley, 84; Oats, 80; Beans, 93; Peas, 90; Potatos, 90; Mangolds, 80; Seeds' Hay, 80; Meadow Hay, 78; Hops, 101. Potatos are very backward and badly in need of rain, while some of the later planted are not yet above ground. Throughout the country the yield is expected to be below the normal, but the great Potato districts of Lincoln and Lancashire (as well as Wales) have rather better prospects than the rest of the country.

Chrysanthemum Society of America.—To those who remember the furore caused by the extension of Chrysanthemum culture in America, in the early eighties of the past century, and intensified very largely by the introduction of Mrs. Alpheus Hardy, the first of the hairy section, it seems strange to notice nowadays how the ardour of the American Chrysanthemum lover has cooled. This was noticeable long before the war. The annual reports of the American Society have long shown an indication of this fact. In the issue, just to hand, entitled *Proceedings of the 17th Annual Meeting*, we notice that last year the shows were much reduced, and the lack of interest in the Society is referred to as deplorable. American growers, however, must not be too pessimistic. To a large extent the flower was under a cloud here during the five years of war, whilst in France the operations of the Chrysanthemum Society were suspended. Yet it is the intention of the Society to resume them. The American bulletin contains a frontispiece portrait of William W. Vert, the president. Then follow a list of the officers, a report of the 17th annual meeting held in New York on November 6-8 last, balance sheet, and list of special prizes. The list of novelties distributed during the past year is divided into two sections, one for purely American raised varieties and the other those imported. The names and addresses of the members, numbering in all 119, conclude this neatly printed little pamphlet, which, we hope, in the near future will grow in usefulness and in bulk.

Horticultural Trade in Belgium.—In a letter from Mr. Herman Ronse and Mr. H. De Schryver, the President and Secretary respectively of the Horticultura Belgica, we learn that the Belgian nurserymen are deeply grateful to their English colleagues for the help already offered, but they point out that this and any other assistance will be of little value to them so long as the United States of America prohibits the importation of plants from Europe. Still further, they are concerned as to the position Great Britain will take up in regard to this matter. If this country also adopts prohibition, the Belgian nurserymen will be completely ruined, because France, Sweden and Norway cannot provide sufficient customers, Germany is out of the question, and fifty out of the very large number of Belgian nurserymen could easily supply all the home requirements. It will be seen, therefore, that in addition to the destruction of many nurseries, or portions of nurseries, and the horrors Belgians have suf-

fered, the horticultural traders of this gallant little country are faced with the loss of practically the whole of their trade if prohibition is also against them. They appeal, therefore, to British nurserymen to help them politically as well as materially, so that the good business relations of pre-war days may soon be resumed.

The Useful Lemon.—The *Phillipine Farmer*, vol. V., No. 2, gives the following numerous uses to which the Lemon can be put. The lemon has many uses in the sick room, the kitchen and the house. The juice from half a lemon in half-a-glass of water before breakfast will correct the most torpid liver and prevent bilious troubles. For hoarseness, lemon and sugar will prove helpful and pleasant to take, and will cure sore throat when used as a gargle. In fever, the lemon is cooling and of great value for moistening the lips and cleansing the tongue. Two or three slices of lemon in a cup of strong, hot tea will often cure a nervous headache, and refresh the mind and body. A spoonful of lemon juice in a cup of black coffee will frequently cure bilious headache. An outward application of lemon will allay irritation caused by insect bites. If a teaspoonful of lemon juice is added to boiling rice or sago, the kernels will be whiter and have a more delicate flavour. Tough meat is made less tough by adding a teaspoonful of lemon juice to the water in which it is boiled. Use slices of lemon to garnish fish and game of all descriptions. Lemon juice with olive oil instead of vinegar is preferred by many for salad dressings. After the pulp has been removed, the skins of lemons may be used as receptacles for serving salads on lemon ice. Lemon ice is one of the cheapest, most healthful and refreshing desserts for the summer. Lemonade should be made the national drink, and is greatly improved when the well-beaten white of an egg is added. Iced tea is improved in flavour and made less constipating by the use of lemons. After the juice has been extracted, the rind dipped in salt will clean tarnished brass. Salt and lemon juice will remove rust, ink or fruit stains from white goods. Lemon juice removes stains of all kinds from the hands, and prevents roughness and chapping. Lemon juice and rose water, equal parts, will remove tan and whiten and soften the skin. A dash of lemon juice in water makes a cleansing tooth wash, removes tartar, sweetens the breath and hardens the gums. Dried lemon peel sprinkled over coals will kill disagreeable odours. A cloth soaked in lemon juice and bound around a cut stops severe bleeding until medical aid can be secured.

FIG. 18.—SUNK ROSE GARDEN AT EARLHAM HALL, NORWICH, THE RESIDENCE OF MR. SYDNEY MORRIS.
(See p. 42.)

Kew Gardens on Peace Day.—We understand that the Royal Gardens, Kew, will be open to the public on the 19th inst., under the same conditions as obtain on a Bank holiday, and the charge for admission will be one penny.

Horticultural Club Outing.—It has been found necessary to make fresh arrangements for the outing of the Horticultural Club to Wisley Gardens on the 25th inst. Lunch will be provided at the Hautboy Hotel, Horsley, and instead of proceeding to Byfleet, the members will entrain at Waterloo Station at 11.10 a.m. for Horsley, which will be reached at 12 noon. From Horsley Station the party will proceed by cars to the Hautboy Hotel, and later, to the Gardens. Tea will be provided in the R.H.S. Gardens, and the return journey will be made by the 7.4 p.m. train from Horsley, which is due to arrive at Waterloo at 7.53 p.m.

Publication Received.—*The Kitchen Garden and its Management.* Abridged and adap'ed from the French work of Professor Gressent, with additions by David Garnett. London: Selwyn and Blount. Price 1s. net.

HOME CORRESPONDENCE.

(*The Editors do not hold themselves responsible for the opinions expressed by correspondents.*)

Chamois-coloured Mole (see p. 26).—In reply to Mr. Davidson, our people caught a white (or dirty white) mole here nearly twenty years ago, but I have not seen one since. I believe there are a fair number of records of this kind. *Chas. E. Pearson*, Lowdham, Notts.

Onions Flowering Prematurely.—Autumn sown Onions and Onion sets have a tendency to flower more or less every year, but this has gone to an extreme this year, apparently, judging from the record by *K.*, Dublin (see p. 28), as well as my own observations. The great heat about the end of May and early part of June, as well as the lack of moisture, would seem responsible for the result. Usually it is sufficient to pick off the flower head at an early stage of growth, to ensure a second growth, resulting in a large bulb at the side of the old one which carries the flower stem. This year I have noticed that the flower stem has often attained a great thickness and produced a medium-sized bulb of good shape. In several cases a second growth of leaves commenced, but, the drought continuing, this became arrested, and it remains to be seen whether any further growth will be made as the result of rain. *J. F.*

Privet Trees.—I wonder if many of the readers of the *Gardeners' Chronicle* are aware of the beauty of a Privet tree. A specimen in front of my window is an exquisite object, now covered with the clusters of white flowers. I cannot tell the height of the bush, but the top is about on the level of the ceiling in the rooms on the first floor. *George Henslow, Danehurst, Bournemouth.*

MR. WILLIAM CRUMP, V.M.H.

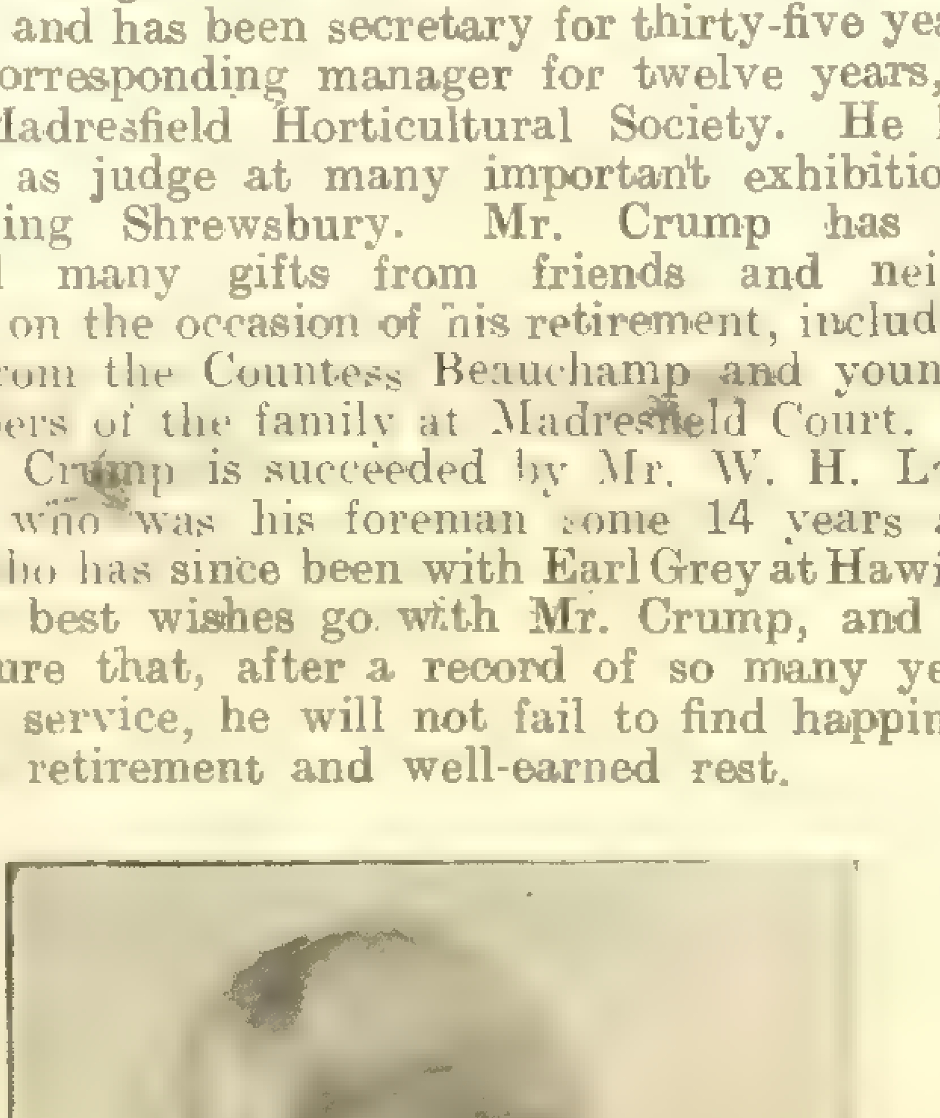
In the *Gard. Chron.*, April 19, 1919, p. 192, we made the announcement that Mr. William Crump was relinquishing his care of the gardens at Madresfield Court, Malvern, after a period of about 40 years' service in that famous establishment. His retirement has now taken effect and readers will be interested in the following account of the career of this distinguished horticulturist. He was born in Shropshire on June 27, 1843, and, as a youth, exhibited a strong inclination for gardening. After receiving the usual education of the village lad, at the local National School, he determined to make gardening his career, but his parents put every possible obstacle in his way, and endeavoured to persuade him to adopt some other occupation. Various posts were offered him, but he was so determined to adopt gardening as his profession that finally his parents consented, and, after a course of probation, he was duly apprenticed in a garden. His first responsible charge was that of foreman of the glass department at Powis Castle, Welshpool, under the late Mr. G. Brown, a famous Scotch gardener of the old school. Powis Castle gardens included a good home nursery at that time, also splendid specimens of trees and shrubs and collections of choice and rare Conifers. The cultivation of the Pineapple was a feature of the place, which also included fine wall trees of Peaches and Nectarines and terraces of hardy, herbaceous flowers. After four years' service, he accepted the office of general foreman at Heckfield Place, Hampshire, under the late Mr. Wildsmith. It was for the experience to be gained from a place where so many famous gardeners had received their early training, rather than for the wages, which were lower than those he had received previously, that Mr. Crump accepted this appointment. After staying there for three years, where fruit and flowers were specialities and so grandly cultivated, he obtained a position as gardener to Mr. F. Harris, Lamberhurst, Kent. The place did not realise his expectations and, after four years, he was appointed to Blenheim Palace gardens, an office demanding much ability and general all-round knowledge. At this time Mr. Crump commenced exhibiting extensively and was successful at the R.H.S. shows at South Kensington, at the Crystal Palace, Royal Botanic Gardens, Manchester, and at other provincial shows. He won several silver cups and gold medals, including the Blue Ribband at the International Potato Exhibition at the Crystal Palace. Most appreciated of all was Messrs. Webbers' packing prize of ten guineas, awarded for the three best packed boxes of fruit, delivered by the railway company at South Kensington intact. This prize was twice competed for against such exhibitors as the late Mr. Coleman, of Eastnor, Mr. Austin of Witley Court and others, and Mr. Crump won the first prize each time. Blenheim Orange, which still holds its own as a scarlet-fleshed Melon, was raised and successfully exhibited in open competition with about thirty others and obtained the R.H.S. First-Class Certificate the same year. After seven years' service at Blenheim Palace, Mr. Crump was appointed to Madresfield Court, where, as stated above, he was gardener for nearly forty years. At Madresfield large numbers of hardy fruit trees are raised annually for both cottage and farm tenantry, and distributed gratuitously. Mr. Crump made many experiments in grafting and double grafting, with a view to the improvement in flavour of choice varieties of fruits. Partial success, at times, seemed hopeful, but further trials proved disappointing, and were abandoned. At Madresfield there is an interesting experimental plot where about 250 varieties of Apples, 80 varieties of Pears and 40 varieties of Plums—all bush trees—are on trial. In addition, there are numbers of seedlings and local varieties of these fruits.

There are many flourishing young orchards on the estate, the result of a scheme introduced some twelve or fifteen years ago, whereby the landowners' and tenants' interests are identical and mutual. A tenant requiring a new orchard makes application for trees, and if the site and soil are considered suitable for fruit growing, the landlord undertakes to find the trees (which are always of the very best and home raised), the stakes, fencing and a skilled man to plant them. He also undertakes the pruning, spraying and other attention for five years, gratis to the tenant. The latter undertakes to find a labourer to assist with planting, and one barrow-full of soil for mulching each tree. At the expiration of five years, the tenant pays an annual rent of 6d. per tree so long as it is in good health. The landlord continues the pruning and the tenant takes all the fruit. The property value is, thereby, very much enhanced, as recently proved.

Mr. Crump was among the first sixty horticulturists selected to receive the Victoria Medal of Honour of Horticulture. He is one of the examiners for the park employees, cottage gardens and allotments, and school teachers' examinations of the Royal Horticultural Society. For twenty-one years he has officiated as a churchwarden of Madresfield Church, has served as a manager of the local schools for seventeen years, and has been secretary for thirty-five years, and corresponding manager for twelve years, of the Madresfield Horticultural Society. He has acted as judge at many important exhibitions, including Shrewsbury. Mr. Crump has received many gifts from friends and neighbours on the occasion of his retirement, including one from the Countess Beauchamp and younger members of the family at Madresfield Court.

Mr. Crump is succeeded by Mr. W. H. Lambert, who was his foreman some 14 years ago and who has since been with Earl Grey at Hawick.

Our best wishes go with Mr. Crump, and we feel sure that, after a record of so many years useful service, he will not fail to find happiness in his retirement and well-earned rest.



MR. WILLIAM CRUMP, V.M.H.

SOCIETIES.

ROYAL HORTICULTURAL.

July 15.—There was a capital exhibition at Westminster on this date, and during the afternoon there was a large attendance, many of the visitors coming from considerable distances to see the National Carnation and Picotee Society's display.

In addition to Carnations, hardy flowers, stove plants and Orchids were prominent features, but the outstanding display was a group of vegetables from Aldenham House, Elstree. Delphiniums and Sweet Peas provided the greater number of novelties.

Floral Committee.

Present.—Messrs. H. B. May (in the chair), E. A. Bowles, George Paul, J. W. Barr, H. Cowley, John Dickson, C. Dixon, John Green, John Heal, Andrew Ireland, E. H. Jenkins, H. J. Jones, J. F. McLeod, W. P. Thomson, Charles Pearson, Thos. Stevenson, Wm. Cuthbertson, S. Morris, C. R. Fielder, Arthur Turner, G. Reuthe, E. F. Hazelton, W. Howe, J. Jennings, and Jas. Hudson.

Awards of Merit.

Delphinium Sir Douglas Haig.—A remarkable variety, with large, semi-double flowers carried in dense spikes of extraordinary size. The colour is deep purplish blue.

Delphinium Millicent Blackmore. — This beautiful variety has semi-double flowers of large size, of a clear, bright mauve blue shade that is very pleasing. The deep brown centre adds to the attractiveness of the flowers that are of regular form and each nearly 3 inches in diameter.

Both the foregoing were shown by Messrs. Blackmore and Langdon.

Delphinium F. W. Smith.—A most attractive variety with rounded, semi-double flowers of large size, long-stalked and daintily set on tall spikes. The colour is bright rich blue, with white centre. Shown by G. Fergusson, Esq. (gr. Mr. F. W. Smith), Weybridge.

Delphinium Joan.—A single variety of large size and good form. The colour is soft medium blue with brown centre. Shown by Mr. W. Wells, Jun.

Sweet Pea Gladys.—A charming variety that bears some resemblance to R. F. Felton, but is of soft lavender blue or light mauve colour and more refined in form than the older variety.

Sweet Pea Doris.—A very attractive Sweet Pea of very waved form and good size. The colour is a very bright shade of cerise pink.

These two varieties were shown by Messrs. E. W. King and Co., Coggeshall.

Sweet Pea Mascott's Scarlet. — A handsome Sweet Pea of fine size and good form and bearing four blooms on every spike shown. The colour is very dense and of a rather deeper shade than one usually understands by scarlet.

Sweet Pea Annie Ireland (see Fig. 22). —A dainty variety with white wings and a blush standard which has a flushed edging of bright pink. The flowers are of exceptionally good form and size.

These two Sweet Peas were shown by Messrs. Ireland and Hitchcock, Mark's Tey.

Rose Sea Foam.—This Rose is a seedling from Rosa bracteata. It bears its double, full blooms in bracteate clusters on stout growths furnished with deep green, neat, shining foliage. The flowers are slightly scented and the petals curve prettily at the margins. Shown by Messrs. Wm. Paul and Son.

Groups.

J. Osborne, Esq., Walton-on-Thames (gr. Mr. G. Cook), exhibited fine flowers of Nymphaea chromatella, N. Marliacea albida, N. M. carnea; and fruiting sprays of Eleagnus longipes; these fruits are said to be useful for preserving. The elongated, ground group contributed by the Alder River Nursery, contained very freely-flowered branches of Plagianthus Lyallii, and fine specimens of Lilium regale, L. pardalinum, Hypericum patalum Henryi, and Coriaria japonica (Silver Banksian Medal).

Stove plants were again well shown by Mr. L. R. Russell (Silver Flora Medal).—Messrs. H. B. May and Sons arranged standard Fuchsias over Ferns, Verbenas, Hydrangeas and Heliotropes (Silver Banksian Medal).—Messrs. Blackmore and Langdon are as expert in Gloxinia culture as in Begonias, and they showed a dozen fine specimens representing a good strain.

Messrs. B. R. Cant and Sons showed a handsome group of cut Roses and displayed the varieties Mrs. Alfred Tate, Iona Herdman, Lyon Rose, Lady Hillingdon, Cupid, Emily Gray and Christine in fine form (Silver Flora Medal).—The Director of the Royal Gardens, Kew, sent flowering branches of the pink Kew Rambler Rose (see *Gard. Chron.*, July 27, 1918, Fig. 12), obtained by crossing Hiawatha with Rosa Soulieana.

Paul's Scarlet Climber Rose was well shown by Messrs. Wm. Paul and Son, who also displayed the single, light yellow Mermaid in excellent condition, as well as their new Seafoam (Silver Banksian Medal). The Rev. J. H. Pemberton showed Roses in variety, including Havering Rambler (pink) and many other varieties of his own raising (Silver Banksian Medal).

Some wonderfully well grown spikes of Delphiniums were shown in big vases by Messrs. Blackmore and Langdon; the spikes of Sir Douglas Haig, Statuaire Rude, Sergeant

Beranger, The Alake, Ampere and Leonardo da Vinci were remarkably good (Silver-gilt Banksian Medal). Mr. G. REUTHE showed hardy flowers and had capital batches of Acantholimon venustum, dwarf heaths and small growing Campanulas.

Mrs. CAMBELL, Upper Gatton Park, Reigate, exhibited about two dozen bunches of Sweet Peas, the leading varieties being Royal Purple, Dobbie's Cream, R. F. Felton, The President, Elsie Herbert and Jean Ireland (Silver Banksian Medal). Messrs. CARTER, PAGE AND CO. made up a very attractive exhibit of Violas. (Silver Banksian Medal). Mr. J. W. MILLER showed Delphiniums and other hardy flowers.

Orchid Committee.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), William Bolton, Arthur Dye, Frederick J. Hanbury, R. Brooman-White, W. J. Kaye, J. Charlesworth, S. W. Flory, Pantia Ralli, Fred Sander, E. R. Ashton, J. Wilson Potter, Richard G. Thwaites and Gurney Wilson.

AWARDS OF MERIT.

Odontioda Lyra, Rosslyn variety (*Odm. Jasper* × *Oda. Royal Gem*), from H. T. PITT, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood). The flowers are large and Odontoglossum-like; the sepals and petals are deep claret-red colour, with faint whitish markings on the tips. The lip is rose coloured in front, the base around the yellow crest being claret-red. The spike bore seven flowers.

Odontoglossum Antinous (*Othello* × *excellens*), from Messrs. CHARLESWORTH AND CO., Haywards Heath. The flower is of perfect shape, the petals and sepals being equally broad, pale yellow in colour, with a profusion of small purple spots on the inner two-thirds of the segments. The very broadly ovate lip is white in front and the basal half bears numerous rose-coloured spots.

OTHER EXHIBITS.

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. J. Collier), showed Dendrobium Gatton Sunray (illustré × Dalhousieanum luteum), a handsome new hybrid raised at Gatton, and which approaches nearest to the Dalhousieanum parent. The flowers are light yellow, with patches of dark claret on each side of the centre of the lip, united by a striated band in front; also the singular Dendrobium chrysocrepis (*Bot. Mag.*, t. 6007), discovered by Mr. Parish in Moulmein in 1871 and later imported by Messrs. James Veitch and Sons. The slender stems bear single yellow flowers, with an orange-coloured pouched lip. Sir Jeremiah Colman also showed a fine spike of the pure white Aerides odoratum album.

Messrs. CHARLESWORTH AND CO., Haywards Heath, were awarded a Silver Flora Medal for an excellent group in which their hybrid Odontoglossums and Odontiodas were the main feature. In the centre of the group were hybrid Thunias, fine forms of Laelio-Cattleya Britannia and the white Cattleya Hesta.

Messrs. STUART LOW AND CO., Jarvisbrook, Sussex, staged a good group, for which a Silver Flora Medal was awarded. At the back of the exhibit was the scarlet Renanthera Imschootiana, with specimens of the pretty Oncidium divaricatum and O. pulvinatum, with a profusion of yellow blooms spotted with red. Other species noted were the rare Dendrobium Farmeri album, D. Brymerianum and other species of Dendrobium arranged with showy Laelio-Cattleyas and Odontoglossums.

Messrs. J. and A. McBEAN, Cooksbridge, showed Miltonia Hyeana McBean's variety (Bleuana × vexillaria Memoria G. D. Owen), a charming, clear white flower, the broad labellum having a blackish crimson mark at the base; also the new Vuylstekeara Bella (Odontioda Thwaitesii × Miltonia Roezlii), a very distinct hybrid with lanceolate sepals, having a tinge of purple at the base, and similar petals with closely-arranged dark, purple markings on the inner half, the broader lip being blush-white with purple markings around the yellow crest.

Fruit and Vegetable Committee.

Present: Messrs. C. G. A. Nix (chairman), E. A. Bunyard, W. Poupart, H. S. Rivers, H. Markham, Ed. Beckett, A. D. Tuckett, Owen Thomas, A. W. Metcalfe, G. Reynolds, Geo. F. Tinley, A. Bullock and J. C. Allgrove.

The Hon. VICARY GIBBS (gr. Mr. Edwin Beckett), Aldenham House, Elstree, exhibited a group of vegetables that "out-Becketted" Beckett (see Fig. 19). It was a wonderful display of cultural skill, of excellent and attractive arrangement, and included almost all kinds of vegetables obtainable at this season. Duke of Albany and Quite Content Peas, Long Purple Aubergines, Early Sunrise and Golden Perfection Tomatos, Victory and Golden Ball Turnips, Walcheren Cauliflowers, Summer Favourite Carrots, White Emperor Onions, and Peerless Cucumbers, were all superb, but Cabbages, Lettuces, Radishes, Broad and Dwarf Beans, Capsicums, Potatos, Beet, Celery, Spinach, Marrows and Artichokes were all surprisingly good. One lady visitor observed: "Beckett is the greatest grower of vegetables on earth," and another lady considered the exhibit to be "exquisitely sweet" —a rather curious description of vegetables.

Mr. H. CLOSE, Littlecroft Nursery, Orpington, Kent, showed a variety of Red Currants named Littlecroft Beauty. The bunches were of large size and hung in profusion from the branches. It was stated that two plants of this variety were included in the trial of Currants at the Wisley gardens.

Mr. A. J. MORGAN, Porthwidden, Devoran, Cornwall, submitted fruits of a seedling Raspberry and a portion of a cane of the current season, showing the exceptional vigour of growth. The berries have stalks some two or more inches long. The variety was recommended for trial at Wisley.

Mr. G. H. MOULD, Rydal, Ambleside, submitted a seedling Strawberry raised from Joseph Paxton × Royal Sovereign. The variety was recommended for trial at Wisley.

FIG. 19.—VEGETABLES EXHIBITED BY THE HON. VICARY GIBBS AT THE R.H.S. MEETING.

Messrs. R. FELTON AND SONS, Hanover Square, showed remarkable fruits of seedless Oranges, imported from South Africa. It was stated that some of them weighed more than a pound each. The fruits were of the seedless or navel type and were among the largest we have seen.

NATIONAL ROSE.

JULY 10.—No more beautiful place than the park of Earlham Hall, Norwich, could have been chosen for the first post-war provincial show of the National Rose Society. Mr. Sydney Morris, of Montbretia fame, the owner of Earlham Hall, is president of the Norfolk and Norwich Horticultural Society. The latter body invited the N.R.S. to visit Norwich—the clean and prosperous city of curving tramways, many churches, and boasting an ancient cathedral. The invitation was accepted as cordially as given and the societies combined forces to produce a great attraction for the people of Norfolk.

The show was held in a hollow in the park,

where five large tents were put up amid a surrounding of fine old trees. Earlham Hall is about between four and five miles from Thorpe Station, Norwich, and the tram terminus in its direction falls short of Earlham by about a mile and a half. In the cool of the morning, as we rode out to Earlham, we had no expectation of seeing a crowd of people during the afternoon, but we did not fully reckon with the great attraction that Roses, other flowers, vegetables and beautiful gardens (see Fig. 18) have for the people of East Anglia. The clerk of the weather did his part admirably, keeping everything cool till just after midday, and then pouring out the summer sunshine in prodigal fashion. The result was a very large attendance. As we left Earlham there was a goodly number of visitors, and we counted a hundred motor-cars just inside the gates, besides a large number of cycles. Between the tram terminus and Earlham some enterprising person did good business with a motor char-a-banc, and all along the Earlham road people in motors and traps, on bicycles and on foot, were streaming out of Norwich and following the route marked out by the ever-present sign: "To the Flower Show."

Mr. S. Morris entertained the officers, members of committee and chief exhibitors of both societies to lunch, at which he presided. Mr. H. R. Darlington, president of the N.R.S., in returning thanks, wished the Norwich society every success and expressed the hope that it would at no distant date again invite the N.R.S.

The Rose show was comparatively small, the recent bad weather having been all against it. With some few exceptions, however, the quality of the flowers was quite good. It was in the matter of competition, especially in the amateurs' section, that there was a great falling off. New Roses were unusually well shown, and the veteran ex-president, the Rev. F. Page-Roberts, was chairman of the adjudicating committee.

FIG. 20.—ROSE MRS. CHARLES LAMPLOUGH; A NEW CREAM COLOURED H.T. VARIETY
(Awarded the National Rose Society's Gold Medal on the 10th inst.)

New Roses.

GOLD MEDAL AWARDS.

Clara Curtis.—A beautiful new Hybrid Tea Rose (see Fig. 21). It has large, full and finely formed flowers of exhibition form and size. The colour is clear Marechal Niel yellow and the broad petalled flowers are exquisitely tea-scented. As judged by the plant shown it is a strong grower. The first flower of this variety shown, at the N.R.S. show at Regent's Park on July 2, gained the silver medal offered for the best H.T. Rose in the nurserymen's section. In shape, substance, colour and fragrance it is a welcome addition. Shown by Messrs. ALEX. DICKSON AND SONS, Newtownards.

Mrs. Henry Morse.—A lovely H.T. variety, with broad petalled flowers of medium size, and slightly tea-scented. The colour is bright shell pink with a glow of salmon pink which comes from the deeper hued bases of the petals. It should prove a keen competitor for popularity with Catherine Mermet. Shown by Messrs. S. McGREDY AND SON, Portadown.

Mrs. Charles Lamplough (see Fig. 20).—A H.T. Rose of large and full exhibition size, broad petalled and shapely. The clear cream colour is of even tone all over the substantial blooms. We predict that this fine novelty will be used as a back and corner flower by exhibitors—a most exacting position. Shown by Messrs. S. McGREDY AND SON.

Mrs. H. R. Darlington.—A large and full exhibition variety with finely-formed blooms, broad-petalled and substantial. It is a H.T. variety, but has little fragrance. The colour is light creamy-yellow. Shown by Messrs. S. McGREDY AND SON.

CERTIFICATE OF MERIT.

Sweetness.—A beautifully formed, medium sized Hybrid Tea Rose of a lovely soft, clear, intense rose, with a soft suffusion of scarlet. Shown by Messrs. S. McGREDY AND SON, Portadown.

Mrs. Arthur Johnson.—A Rose of strong growth. The blooms are of good form and substance, and very slightly tea-scented. The colour is rich orange-yellow, shading to chrome-yellow. Shown by Messrs. S. McGREDY AND SON.

Sceptre.—A brilliant H.T. Rose of similar shape to The Queen Alexandra. The colour is bright flame, with gold at the base of the petals and a dull yellow shading on the outside of the petals. Shown by Messrs. S. McGREDY AND SON.

Berkeley.—A lovely decorative H.T. Rose of attractive shape. The colour is deep golden yellow. Shown by Messrs. S. McGREDY AND SON.

Capt. F. Bald.—A large-flowering variety with unusually broad petals that make up a big bloom. The colour is soft and dull rosy crimson. Shown by Messrs. ALEX. DICKSON AND SONS.

Nurserymen's Classes.

The Nurserymen's Jubilee Trophy for thirty-six Roses, distinct, was won by Messrs. D. PRIOR AND SON, Colchester, in a keen competition between four entrants. Messrs. Prior's exhibit was a capital one, the blooms large and full. Notable blooms were those of Mdme. Jules Gravereaux, Mamie, Mrs. A. E. Coxhead, Lieut. Chauré, Gloire de Chédane Guinoisseau, Bessie Brown, Modesty, The Bride, Louise Crette, George Dickson, and Maman Cochet. Messrs. B. R. CANT AND SONS second, and Messrs. FRANK CANT AND CO. third.

For forty-eight blooms, distinct, Messrs. D. PRIOR AND SON were again first prize winners, with a set very little inferior to their 36 stand. Maman Cochet, Cardinal, Mrs. Sam Ross, Avoca, Candeur Lyonnaise, Mildred Grant and Mélanie Soupert were finely shown. Messrs. FRANK CANT AND CO. second, and Messrs. B. R. CANT AND SONS third. Messrs. G. and W. H. BURCH won first prize for twenty-four blooms, distinct, and were followed by Mr. GEO. LONGLEY, Rainham.

The only entry of twelve Teas and Noisettes came from Messrs. D. PRIOR AND SONS, and they obtained the first prize for a fair stand in which Maman Cochet, Medea and White Maman Cochet were the best flowers.

For a dozen new Roses introduced since January 1, 1915, Messrs. ALEX. DICKSON AND SONS led with Col. Oswald Fitzgerald, Margaret Dickson Hamill, Capt. Fane Bald, Janet and Alex. Emslie as their best varieties: Messrs. FRANK CANT AND CO. second, and Mr. ELISHA HICKS third.

Messrs. ALEX. DICKSON AND SONS scored for a basket of fourteen blooms of one variety with very fine specimens of the deep and rich crimon-scarlet Col. Oswald Fitzgerald: Messrs. D. PRIOR AND SON second, with White Maman Cochet; and Messrs. G. and W. H. BURCH third, with Modesty. A beautiful set of five baskets of decorative Roses obtained first prize for Messrs. ALEX. DICKSON AND SONS; the varieties, in fine form, were Lady Hillingdon, Mrs. C. V. Haworth (see Fig. 13), K. of K., Irish Fireflame, and Chrissie McKellar. For three baskets of Roses, Mr. HENRY MORSE, Westfield Nurseries, Eaton, was first with K. of K., Golden Emblem (very fine), and The Queen Alexandra; Mr. ELISHA HICKS, second.

Groups of Roses.

The first prize for two dozen bunches of decorative Roses was won by Messrs. FRANK CANT AND CO. with a beautiful exhibit in which the varieties Simplicity, Mrs. Alfred Tate, Rayon d'Or, General McArthur, Francois Guillot, Mrs. Carnie (a new Wichuraiana seedling, white with cream centre), Mme. E. Herriot and Crimson Emblem were of outstanding merit. This was the only exhibit in its class.

The best group of a dozen vases of decorative Roses was staged by Messrs. G. AND W. H. BURCH, who had charmingly fresh blooms rather closely bunched; Mr. ELISHA HICKS was placed second, but we think many judges would have reversed the order of the awards.

An exceptionally fine group won for Messrs.
